The name Uigurs is very common during the Mongolian period, and Rashīd ed-Dīn and others use it (by an anachronism) in speaking of remote antiquity, though it is wholly unknown to the Arabic geographers, and, as Vambéry has shown, to the Uigurs themselves,—nay, even impossible in the old Turkish language, in which the form would be Utkur. The name Ugur, Ogur, or Ogor of Byzantine authors is really different; but Grigorieff has recognized the name in the corrupt Arabic form of Tagazgaz, which must be read Toguz-Ugūr,[8] the "Nine Ugurs," to distinguish them from another division of the same tribe, the On-Ugur or "Ten Ugurs." In the time of Ibn Khordādbeh and Mas'udī these Turks had gained the supremacy amongst their brethren, and had their residence at Kushān, which has been identified with the Kiao-chang of the Chinese. According to their accounts, the Kiao-chang form the southern division of the Hui-khe (Hoei-ke of Deguignes), and were settled before the Christian era south and east of the Tian-shan up to the Pamir plateau and the Kuen-Lun. The Arabic authors make them adherents of Manichæism; but as the original Turkish Shamanism has developed into a dualistic system, this statement may rest on a partial misapprehension. It seems, however, certain that Buddhism reached these Turks on its way towards China, for we know that this religion spread in the 2d century B.C. throughout the adjacent kingdom of Bactria, and was still flourishing when Hwen-T'sang visited (7th century) those regions. Thus we can understand why the old Ural-Altaic religion bears a Sanskrit name. The northern division of the Hui-khe, which remained unknown to the Arabs, wandered from the Selenga region to the sources of the Yenisei, vanquished the Tu-kiu (745), and founded an empire from the Selenga to Lake Balkash, till they were overthrown (841) by the Ha-kas (identified with the Kirghiz). These northern Uigurs are called by the Chinese Kao-che, Chi-le, Di-li, and Te-le. The history of the southern branch is unknown, for the chronological data of Rashīd ed-Dīn and Abu-'l-Ghāzi are contradictory and useless, though their statements that the prince bore the title of Idi-kut and submitted to the Mongols have full historical weight. That the Uigurs rose during the Mongolian epoch to a certain supremacy by higher culture is attested by Rashid ed-Dīn and Jowaini, who often mention Uigurian books.

The Uigurs.

The Petchenegs (Gr. Πατζινακαι, Πατζινακιται; Magyar *Besenyö*; Lat. *Bisseni*) were of old, as Constantine Porphyrogenitus tells us, settled about the lower Ural and Volga, but were driven thence (894–899) by the Ghuzz (Ouzoi). A part of them returned afterwards to their ancient abode, but the great majority wandered westward and settled on both sides of the Dnieper, driving the Hungarians before them to the Carpathians. Here they annoyed the neighboring peoples by their raids, and engaged readily in the Russian expeditions against the Greek empire, till the policy of the Byzantine court incorporated large numbers of them with its own armies, sometimes with fatal result, as was experienced by Romanus Diogenes, when these auxiliaries passed to

The Petchenegs.

[1] Comp. PERSIA, vol. xviii. pp. 659–60, 651–52.

[2] Radloff, for instance, thinks that the name U-ssun, and perhaps remnants of the people denoted by it, survive in the present Uisuns, a division of the Great Horde of the Kirghiz. At the time of Alexander the Great's expeditions against the Scythians beyond the Jaxartes, we find in that region certain traces of the Turkish language in names of places and persons (cp. vol. xviii. p. 599, note 4). It is therefore certain that long before the age of the Hiong-nu Turkish tribes had spread to the borders of the Jaxartes, and even along the northern coast of the Caspian to the rivers Ural and Volga. But the ethnical denominations of antiquity—Scythians, Parthians, Massagetæ, Sacæ, etc.—do not convey to our mind clear ethnical distinctions, so that the true nationality of these peoples has been much debated. Neither are the pre-Semitic culture of Babylonia and the supposed "Turanian" origin of the Accads facts of such character that from them we can infer the presence of Turks in these regions in remote antiquity.

[3] On the Petchenegs see below.

[4] From their Chinese name it may be inferred that the Juen-Juen were a Mongolian people, in which case the Avars, who are supposed to have been a division of them, were also Mongols.

[5] See Nöldeke, *Geschichte der Perser und Araber*, p. 158. The first part of this name is without doubt the Turkish *sünjü*, *süngü*, which means "lance," a Turkish proper name of the same kind as Kilij = "sword," which in its Persian form, Nizek, was afterwards borne by a prince of Transoxiana, often mentioned in the accounts of the Arabic conquest.

[6] Cp. Mas'udī, ed. Paris, i, 288; Nöldeke, *ut sup.*, p. 269, n. 1.

[7] The title Noyon, if the present writer's conjecture on the text of Tabarī, ii. 1195, is right, proves that Kurbogha was a Mongolian prince.

[8] Before this Reinaud had conjectured that the Tagazgaz were the same as the Uigurs, but failed to correct the Arabic corruption.

the camp of his antagonist Alp Arslān. At the period of the first crusade the Christian armies met with them on their march through Servia and Bulgaria; but the Petchenegs are not mentioned after the 13th century. The learning of Orientalists has discovered faint traces of the language once spoken by them in the Turkish dialect of the Bosnians.[1]

The Comans.

Comans or Cumani (Russ. *Polowtze*, Magyar *Palocz* and *Kun*) is a term chiefly used by Europeans for the Turkish tribes that occupied Moldavia and the adjacent regions of south Russia. The origin of the name is uncertain; but it seems to be Turkish, though it rarely occurs in Oriental records. The most probable conjecture regarding the people denoted by it is that they were a mixture of Ghuzz and Petchenegs. Oriental authors know much more of their neighbors to the east, the Kipchaks, a very common name of Turkish clans down to the present day. Sometimes both names are combined: Rubruquis speaks of the Coman Kipchaks. Anna Comnena informs us that the Comans spoke the same dialect as the Petchenegs, a dialect well known to European scholars from the so-called Codex Cumanicus.[2] On the arrival of the Mongols in these regions, the Kipchaks suffered great hardships, and large numbers of them were sold as slaves throughout the Mohammedan world. From them sprang the Bahrite Mameluke sultans of Egypt (1250–1380). The Comans sought refuge amongst the Hungarians and became Christians; but their arrival, causing internal dissensions in Hungary, greatly favored the advance of the Mongolian arms. The remnants of the Comans, Kipchaks, and other Turkish tribes continued to dwell in southern Russia under Mongolian rule (see MONGOLS), whilst others became merged with the Hungarians.

The Ghuzz.

The Ghuzz dwelt originally in the far East amongst the Toguz-Ugur, but migrated in the reign of the caliph Al-Mahdí (775–785) to Transoxiana, where they adhered to the cause of the famous Al-Moḳanna', not from religious predilection, but to satisfy their love of war and plunder. In the same manner they afterwards served every warlike prince in their neighborhood, and entered like other Turks into the service of the caliphs. The main body of the lifeguard of the 'Abbāsids consisted of Turks, and some individuals rose very soon to high commands. Entrusted with the administration of distant provinces, they founded independent princely houses, such as those of the Tulunids and Ikhshids in EGYPT (vol. vii. p. 658) and the Ghaznavids (see GHAZNI). In the meantime fresh bands of the Ghuzz poured from the east and the north into Turkestan, the region becoming overstocked with a nomadic population. Some of them sought and found an outlet to the west by occupying the territory of the Petchenegs and joining the Turkish population of southern Russia; but the great majority, seeing the ruined state of the empire of the caliphs, crossed the Oxus and overran the northern and eastern provinces of Persia. How these loose desultory bands were guided to subsequent victories, and moulded with the peoples amongst whom they settled into regular political bodies, has been already narrated under SELJUKS (*q.v.*).

Turkmans.

Meanwhile they underwent a great change in their outward appearance, habits, etc., as Rashīd ed-Dīn relates, owing to the influence of the air and the water, and, we may add, to frequent intermarriage with the inhabitants of the countries invaded by them. After some generations the change was great enough to strike their Iranian neighbors, who called them Turkmans (Turcomans),[3] a term implying resemblance to Turks. It is therefore quite natural that the modern Osmanlis should have become Caucasians; for, if Rashīd ed-Dīn in the 13th century noticed the difference between a Turkman and a genuine Turk, the six centuries which have elapsed since amply suffice to have obliterated all original Ural-Altaic characteristics. The old name Ghuzz, originally, as it seems, the Turkish Oghuz (an eponymous hero of whom Turkish chronicles tell many fables) was wholly superseded by the new name Turkman and by other political names.

Empire of Khārizm.

During the Seljukian period there arose in Transoxiana the empire of the Khārizm shahs, founded by Mohammed b. Anushtegīn, upon whom the government of Khārizm (Khiva),—which down to 995 had belonged to princes of Iranian descent—was conferred (1097) by the Seljuk prince Barkiyārok. His son Atsiz became independent (1138), but his empire seemed destined to early ruin by the arrival of the Kara-Chitai, who defeated the Seljuk prince Sinjar (1141) and became for a time supreme masters of Turkestan. Nevertheless the Kharizmian dynasty held its place as a tributary sovereignty, and developed great power under the princes Takash and Mohammed his son. The former defeated and killed (1194) the last Seljuk prince of 'Irāḳ, and the latter extended his dominion from the Caspian to the Indus and from the Jaxartes to the coast of 'Omān. His cunning antagonist, the 'Abbāsid caliph An-Nāsir, invoked the aid of Jenghiz Khān, who scarcely required this invitation to attack Mohammed. The sack of Bokhāra was followed in the same year (1220) by that of the other principal cities of Transoxiana and by the persecution of the unhappy prince, who died in a forgotten island of the Caspian. His son Jelāl-ed-Dīn was driven towards India, but by a change of fortune ascended once more the throne of his fathers, till the new Mongol khān, Ogdai, sent fresh armies against him and forced him to seek refuge in the Kurdish Mountains, where he was murdered (1231). The fate of the Turks of Transoxiana was shared by their brethren in Asia and Europe, and new Mongol-Turkish empires arose, of which an outline has been given under MONGOLS. As the Mongol rule grew weaker, there arose in Persia and on the frontiers of Asia Minor the Turkman dynasties of the Ak Koyun-lu, the Kara Koyun-lu, the Zu'l-kadria, and the Ramazān Oglu, whose history is closely connected either with that of the rise of the Ottoman power (see below) or with the history of PERSIA (see vol. xviii. p. 652 *sq.*).

Modern tribes.

At the present day the Turkish people occupy a very extensive area, the centre of which lies in Khiva, Bokhara, and Khoḳand, and which stretches from the lower Lena in Siberia to the Danube and from the Crimea to Kermān and India. Politically they belong to Russia, Turkey, Persia, China, and Afghanistan. In religion the great majority are Mohammedans; a few tribes in Russia are baptized Christians; and some others adhere to the original Shamanism, which has also influenced the religious conceptions of the Christian and Mohammedan Turks. The principal Turkish peoples are the following: (I.) By a popular distinction the Turks of Siberia and Russia, with some colonies in Turkey, are styled Tatars (see TARTARS), though the Yakuts of northern Siberia are not usually included in this term. The Yakuts, who are perhaps a mixture of Turkish and Tungus tribes, deviating from the ordinary course of Turkish wanderings, are settled about the Lower Lena, and number probably 200,000 (Rittig, 80,000; Lansdell, 210,000).[4] They are nominally Christians. (II.) On the Kirghiz (Kara-Kirghiz and Kazāks) and Kara-Kalpaks see KIRGHIZ; but note that the Kipchaks, named there as a separate tribe, really form a subdivision of the Kazāk-Kirghiz, and are perhaps akin to the Kitai-Kipchaks, who are reckoned to the Uzbegs. (III.) Uzbeg is a political, not

Tatars.

Kirghiz.

[1] Comp. Blau, *Bosnisch-Türkische Sprachdenkmäler* (Leipsic, 1868), p. 315.

[2] Edited by Geza Kuun, Buda-Pesth, 1880–83.

[3] The term "Turkman" occurs in Arabic chronicles of the Seljukian period, and even in Moḳaddasí, p. 274. Rashīd ed-Dīn therefore exaggerates in stating that it only came into use in his lifetime. But Vambéry's statement that it was applied of old to the descendants of Oghuz is contradicted by the genuine Persian text of Rashīd ed-Dīn and the unanimous testimony of history. His objections against the popular etymology mentioned above are, however, not quite unfounded.

[4] Cp. E. Petri, "Neueres über die Jakuten," in *Peterm. Mitth.*, 1887, vol. xxxiii. p. 102 *sq.*

an ethnological denomination, originating from Uzbeg Khān of the Golden Horde (1312–1340). It was used to distinguish the followers of Shaibāni Khān (16th century) from his antagonists, and became finally the name of the ruling Turks in the khanates as opposed to the Sarts, Tajiks, and such Turks as entered those regions at a later date and are known to be Kirghiz, Kara-Kalpaks, or Taranjis. The Uzbegs are therefore a mixed race of different Turkish tribes. According to Kostenko,[1] they number 201,972 in the Russian provinces of Syr-Daria, Ferghāna, Zerafshan, and Amu-Daria, and Vambéry conjectures that there are 1,000,000 more in Bokhara, 700,000 in Khiva, and 200,000 under Afghan supremacy, giving a total number of about 2,000,000. They are agriculturists or inhabit the cities; a few are semi-nomads. (IV.) The eastern Turks on the southern slopes of the Tian-Shan Mountains at Kashgar, Ust-turfan, Ak-su, Sairam, Kutcha, Yarkand, Khotan, etc., are the remnants of the ancient Uigurs; and of the same origin are the Taranjis (= agriculturists), settled in the Ili valley and elsewhere. The number of the latter is given as about 50,000; that of the former may be estimated from the statements of Forsyth[2] and Kuropatkin[3] at about 1,000,000 for the whole district, the great majority being Turks and the rest Mohammedan Chinese (Sungans). (V.) The Turcomans (properly Turkmans) inhabit the steppe east of the Caspian and south of the Oxus from Astrabad to the Paropamisus. The term is sometimes taken to include their brethren in Persia and Asia Minor, who will be treated separately. The following are the principal tribes: (1) The Tchaudors and Imrailis, in the northwestern part of the Ust-Urt to the Gulf of Karaboghaz; (2) the Yomuts, extending from Khiva across the Ust-Urt to the Caspian, and along the seaboard to Persia; (3) the Göklen, on Persian territory, between the upper Görgen and Atrek; (4) the Tekkes, the most numerous tribe at the present day, divided into the Akhal Tekkes and the Merv Tekkes, so named after the centres where their greatest numbers are found; (5) the Sakars, on the left bank of the Oxus, to the east of Tcharjui, considered by Vambéry as a division of the Tekkes; (6) the Sariks, at Penjdeh and Yul-utan on the northwestern slopes of the Paropamisus; (7) the Salors, one of the oldest Turkman tribes, who suffered greatly from the Tekkes, till they finally migrated (1857) to Zurabād in Persia, and left their former districts to the Tekkes and Sariks; (8) the Ersaris, on the Oxus about Khoja Salih; and (9) the Ali-elis, about Andkhui. Their total number, inclusive of some Turkmans who do not belong to any of these tribes, and are scattered throughout the provinces of Syr-Daria, Amu-Daria, Zerafshan, and Astrakhan (about 16,000), is estimated by Vambéry at about 1,000,000, and by Grodekoff at 1,170,000. The Turkmans are, with few exceptions, nomads, and were formerly the terror of their neighbors, who feared them as the "man-stealing Turks"; but since Merv has been annexed to Russia (1884) they have been compelled to abandon their predatory habits.[4] (VI.) The Turkish nomads scattered throughout Persia are partly the descendants of the Ghuzz tribes that invaded the country at the Seljukian period; others have migrated thither in the following centuries. They are known by the name of Ilāt or Iliyāt (meaning tribes or peoples) and consist of several tribes, having each its own chieftain, the Ilkhānī, appointed by the shah. An accurate list of the names of these tribes does not exist; but the most powerful and the most numerous are the following: (1) The Kajars, who dwelt in Transcaucasia down to the time of Abbas the Great, by whom one division of them was compelled to settle at the southeast corner of the Caspian near Astrabād. To this division belongs the present dynasty of Persia. (2) The Afshars or Aushars, a very numerous tribe, in the province of Adarbaijān (Azerbijan). A division is also settled in the mountainous regions of the Antitaurus; its members are nominally subjects of the Ottoman empire but really independent. (3) The Shekakis and Shah-sewen. The latter is not a tribal, but a political name, meaning those who love the shah, *i.e.*, partisans of the Ṣafawī dynasty (1499–1736) and the Shī'ite faith. (4) The Kara Koyun-lu, near the town of Khoi, the remnants of the once powerful tribe named above. Besides these, many other names are recorded of tribes wandering in the Transcaucasian regions and in the provinces of Adarbaijān and Mazenderan, but many of them are very uncertain. All these Turks are comprehended under the general denomination of Adarbaijāni Turks; they are nomads or semi-nomads and speak a peculiar Turkish dialect, the Turk Azeri or Adarbaijāni Turkish. Some specimens of it have been published by Chodzko, Bergé, Melgunoff, and Barbier de Meynard. In the southern provinces of Persia are settled the (5) Kashkais, (6) Abul-werdis, (7) Kara-Gözlüs, (8) Bahar-lu, and (9) Inan-lu. To the first named are reckoned by some the Khalaches,[5] an old Turkish tribe which was already settled near Herat before the Seljukian period and has given rise to some Indian dynasties. Vambéry thinks that the total number of Iranian Turks may amount to about two millions, or, if we add the Caucasian Turks under Russian supremacy, three millions.[6] (VII.) The Osmanlis, under which term are comprehended all the Turkish subjects of the sultan of Turkey, consist chiefly of the following elements: (1) Turkmanian tribes and Turks of every description, who poured into Asia Minor after the defeat of Romanus Diogenes (1071); to these we may also reckon the Ottomans proper, though they did not enter the country till after the downfall of the Kharizmian empire. The Mongolian invasion drove the obscure ancestors of this the most illustrious Turkish dynasty to Asia Minor, whence they gradually spread to the province of Khodawendikyār (Bithynia). (2) Tatars scattered amongst the rest of the population, but forming a large colony in the Dobrudja. In part they occupied their present settlements before the conquest of Constantinople; but others have immigrated into Asia Minor during the last two centuries from the Crimea and Caucasus, since the Russian conquests of those regions. They have fared very badly under Turkish rule, as is attested by Captain Wilson. That tribes of Turkish origin were settled in Europe long before the rise of the Ottoman power is known from the Byzantine authors, who mention a colony of them (about 30,000) as early as the 10th century in the Vardar valley in Macedonia.[7] (3) The so-called Kizil-bashis or "Red Heads," a nickname of the Shi'itic Turkish immigrants from Persia, who are found chiefly in the plains from Kara-hissar along Tokat and Amasia to Angora. During the wars with Persia the Turkish sultans forced them to settle here. They are agriculturists and highly praised by several travellers for their honesty and laborious habits. (4) Turkmenian tribes—Yuruks and Götchebes (words meaning "nomads" and characteristic of their most distinctive quality),—who occupy the mountains in summer and descend into the plains in winter, though some are settled in the plains of Cilicia near Tarsus and Adana, the rest being semi-nomads. Reclus estimates the total number of Turks in Europe at 1,500,000 and 35,000 Tatars. For Asia Minor statistics are wanting; but P. de Tchihatchef, the chief authority for matters relating to this peninsula, thinks that 6,000,000 is a fair estimate for the total population, including Greeks, Armenians, Kurds, etc., but excluding the islands. It appears therefore necessary to reduce the already moderate number of Osmanlis given by Vambéry (10,000,000) to about 6,000,000.

Language.

The Turkish, or, as some prefer to say, the Turco-Tatar language, is a member of the Ural-Altaic family (see Ural-Altaic), and comprehends many dialects, which differ considerably in their vocabulary and in a less degree also in their grammar. The study of these dialects has made great advances during the 19th century. Abel Rémusat in 1820 knew only of four, viz., the Uiguriau, Jagatai, Tatar, and Osmanli. Béresine in 1848 distinguished nineteen, grouped round three types, viz. (1) Jagatai dialects (Uigur, Coman, Jagatai, Uzbegian, Turkmani, Kazani literary language); (2) Tatar dialects (Kirghizian, Bashkiri, Nogai, Kumi, Karatchai, Kara-Kalpaki, Meshtcheryaki, and Siberian); (3) Turki dialects (Derbendi, Adarbaijāni, Krimmi, Anadoli, and Rumili). Böhtlingk (1851) added the Yakuti, and Shaw (1877) the Eastern Turki. Radloff (1882) subdivided the one Siberian dialect of Béresine into more than a dozen different dialects. On phonetic principles the last-named proposes the following classification, which seems, however, not quite satisfactory: (1) Oriental dialects (Altai, Baraba, Lebed, Tuba, Abakan, Küärik, Soyon, Karagass dialects, and Uigur); (2) Occidental (Kirghizi, Irtish, Bashkir, and Volga dialects, with numerous subdivisions); (5) Central-

Dialectical varieties.

Asiatic (Taranji, Jagatai, etc.); and (4) southern (Turkmani, Adarbaijāni, Caucasian, Anadoli, Krimmi, and Osmanli). It would be premature to criticise this system till the author publishes the second part of his grammar, which will treat of the real etymological phenomena of the north Turkish dialects. On the phonetical characteristics of each of these dialects ample information is given in his *Phonetik der nördlichen Türk. Sprachen*.

These great dialectical varieties are easily accounted for by the want of a common Turkish literary language understood everywhere. The most developed and refined Turkish tongue, that of the Osmanlis, which is very rich in literary monuments, has admitted too many Arabic and Persian words, grammatical forms, and even whole sentences, and has been too much spoiled by the precepts of Persian rhetoric, to produce a popular literature. With the exception of some tales and novels, this literature has remained an exotic production, unintelligible even to the people who are supposed to speak the same language (see TURKEY, p. 698 above). The Jagatai and Uzbegian dialects would have answered the purpose better, and present the best type of a (hypothetical) general Turkish language, of which the most prominent features may be here given.

Alphabet.

The Arabic alphabet is in general use, though some tribes in Russia make use of Russian and others in Asia Minor of Armenian and Greek characters. But the oldest Turkish alphabet, the Uigurian, is a direct transformation of the Syriac, and has fourteen characters. When and by whom it was invented is uncertain; the Arabic author of the *Fihrist* does not mention it, and the Uigurian MSS. which we possess date for the most part from the 15th century. It is commonly supposed to be the work of Nestorian missionaries, who may have preached the Gospel amongst the Turks as early as the 6th or 7th century.[1] In the age of Sinjibu the Turks seem to have used the Sogdian characters in their political intercourse with Byzantium; but as a rule they remained illiterate till their conversion to Islam. As the Semitic languages are characterized by the three-radical system and the constancy of the consonants, all Ural-Altaic languages are dominated by the law of vowel harmony and agglutination. We have therefore in Turkish a double range of vowels, commonly eight in number, of which *a, i, o, u* denote the hard or guttural and *ä, ï, ö, ü* the soft or palatal vowels, the vowels in every separate word being of the same range. The *i* only is in most dialects indifferent. The law of agglutination is derived from the same principle, but has regard, not only to the vowels, but also to the consonants and the syllables; it is an abuse of the term if it is taken to mean that in Turkish no real etymology exists, but only an agglutination of themes and roots.

Etymology.

As regards the etymology we observe the absence of gender, of a separate form for the dual, and of the nominative in the nouns. There are commonly five oblique cases—genitive, dative, accusative, commorative, and ablative—though Böhtlingk has shown that in the Yakut dialect, which distinguishes ten cases, the genitive is wanting. The adjective, unless used as substantive, is uninflected both as attribute and as predicate; the comparative is formed by the suffix *-rak* (*-rek*), and takes the compared noun in the ablative; the superlative has no specific form, though a peculiar intensive is formed by prefixing to the adjective (though in writing always as two words) a syllable beginning with the same consonant, and ending in a labial *p* or *m*; for instance, *kap kara*, "intensely black"; *kip kizil*, "intensely red." The decimal system has prevailed over an original septimal system. The article does not exist. The relative pronoun has been borrowed from the Persian in many dialects; it is absent in the original Turkish. The theme of the verb is seen in the imperative, from which are derived various participles and gerunds, used either separately or combined with pronominal suffixes. These combinations supply the forms of the simple tenses and moods, though different dialects use different forms of participle and gerund for this purpose. Compound tenses and moods are expressed by means of auxiliary verbs. The theme of the imperative may, by the addition of a simple consonant, vowel, or syllable, be modified into a negative, passive, reflective, reciprocal, impossible, causative, or doubly causative form, which are conjugated in the same manner as the original form. The causative forms again admit of a passive negative, etc., so that in fact the number of possible verbal forms derived from a single theme has been calculated by Shaw at 29,000. There are no prepositions, only postpositions.

Syntax.

In syntax the order of the words and clauses of a period is almost the inverse of what seems natural to us, the subject and its predicate being placed at the end, while all hypothetical, causal, prohibitive—in short all subordinate—clauses come first. In the simple style of illiterate peasants, and in popular romances and tales, this method presents no inconvenience as regards easy understanding, but in the artificial, often excessively long periods of an Osmanli stylist, it presents serious difficulties to a European reader.

[1] For details about the spread of Christianity amongst the Turks see Yule, *Cathay and the Way thither*, i. 90-100.

Bibliography.—(*a*) General works on the history and ethnography of the Turks: Deguignes, *Histoire des Huns;* Vambéry, *Das Türkenvolk* (Leipsic, 1885), *Ursprung der Magyaren* (Leipsic, 1882), and several other publications; Radloff, *Aus Sibirien* (Leipsic, 1884); W. Grigorieff, *Zemleuvjedjenie K. Rittera Wostotschni iti Kitaiski Turkestan;* Neumann, *Die Völker des südlichen Russland* (Leipsic, 1847). We may add the historians of the Mongols—D'Ohsson, Howorth, and others—the numerous journals of travellers amongst Turkish peoples, and several articles in the *Russische Revue, Journal of the Royal Asiatic Soc.*, etc. A full bibliography of works relating to Central Asia may be found in V. J. Mejoff, *Recueil du Turkestan* (St. Petersburg, 1878-84), and a useful excerpt at the end of vol. ii. of Lansdell's *Russian Central Asia*. Other works have already been cited in the course of this article.

(M. T. H.)

TURMERIC, the tuberous root of *Curcuma longa*, L., an herbaceous perennial plant belonging to the natural order *Zingiberaceæ*. It is a native of southern Asia, being cultivated on a large scale both on the mainland and in the islands of the Indian Ocean. Turmeric has been used from a remote period both as a condiment and as a dye stuff, and to a more limited extent as a medicine. In Europe it is employed chiefly as a dye, also as an ingredient in curry powder and as a chemical test for alkalies. The root is prepared by cleaning it and drying it in an oven. There are several varieties (Madras, Bengal, Gopalpur, Java, China, and Cochin turmeric), differing chiefly in size and color and to a slight degree in flavor. Some of these consist exclusively of the ovate central tubers, technically known as "bulbs," and others of the somewhat cylindrical lateral tubers, which are distinguished in trade as "fingers." Both are hard and tough, but break with a short resinous or waxy fracture, which varies in tint from an orange brown to a deep reddish brown.

Turmeric has a characteristic odor and an aromatic taste. The aroma it owes to a complex essential oil, which consists principally of an alcohol called *turmerol* (formula $C_{19}H_{28}O$), which differs from carvol in being unable to combine with hydrogen sulphide; the other constituents of the oil have not been determined. The color is due to *curcumin*, $C_{14}H_{14}O_4$, of which the drug contains about 0.3 per cent. It possesses the properties of an acid, forming red-brown salts with alkalies and being precipitated from alkaline solutions by acids. When pure it forms yellow crystals having a vanilla odor and exhibiting a fine blue color in reflected light. It is soluble in alcohol, in chloroform, and in alkaline solutions, but only sparingly in water. Paper tinged with a tincture of turmeric exhibits on the addition of an alkali a reddish brown tint, which becomes violet on drying. This peculiarity was pointed out by Vogel in 1815, and since that date turmeric has been utilized as a chemical test for detecting alkalinity. In India the drug is considered to possess cordial and stomachic properties: a decoction made with milk and sweetened is used as a remedy for colds. Externally it is employed in skin diseases and in the form of a cooling lotion for relieving the pain of conjunctivitis; the fumes of the burning tubers directed into the nostrils relieve congestion in cases of coryza. The cultivation of turmeric is carried on most successfully in light rich soil in well-watered districts. The plant is easily propagated by offsets. An acre yields about 2000 lb. Turmeric is said to grow in large quantities on the slopes of hills bordering the plains of the Beni in Bolivia and also in Panama. Several species of *Curcuma* and of allied genera yield yellowish

aromatic roots. In Sierra Leone a kind of turmeric is obtained from a species of *Canna*.

TURNER, Charles (1773–1857), an English engraver, was born at Woodstock in 1773. He entered the schools of the Royal Academy in 1795; and, engraving in stipple in the manner of Bartolozzi, he was employed by Alderman Boydell. His finest plates, however, are in mezzotint, a method in which he engraved J. M. W. Turner's Wreck and twenty-four subjects of his *Liber Studiorum*, Reynolds's Marlborough Family, and many of Raeburn's best portraits, including those of Sir Walter Scott, Lord Newton, Dr. Hamilton, Profs. Dugald Stewart and John Robison, and Dr. Adam. He also worked after Lawrence, Shee, and Owen. He was an admirable engraver, large, broad, and masterly in touch; and he reproduced with great fidelity the characteristics of the various painters whose works he translated into black and white. In 1828 he was elected an associate engraver of the Royal Academy. He died in London on 1st August, 1857.

TURNER, Joseph Mallord William (1775–1851), one of the greatest painters of the English school, was born in London on 23d April, 1775. His father, William Turner, a native of Devonshire, kept a barber's shop at 26 Maiden Lane, in the parish of St. Paul's, Covent Garden; he was "a cheerful, talkative little man, with small blue eyes, a parrot nose, projecting chin, and a fresh complexion indicative of health." Of the painter's mother, Mary Marshall or Turner, little is known; she is said to have been a person of ungovernable temper and towards the end of her life became insane. Apparently the home in which Turner spent his childhood was not a happy one, and this may account for much that was unsociable and eccentric in his character. The earliest known drawing by Turner, a view of Margate Church, dates from his ninth year. It was also about this time that he was sent to his first school at New Brentford. Of education, as the term is generally understood, he received but little. His father taught him to read, and this and a few months at New Brentford and afterwards at Margate were all the schooling he ever had; he never mastered his native tongue, nor was he able in after life to learn any foreign language. Notwithstanding this lack of scholarship, one of his strongest characteristics was a taste for associating his works with personages and places of legendary and historical interest, and certain stories of antiquity seem to have taken root in his mind very strongly. By the time Turner had completed his thirteenth year his school days were over and his choice of an artist's career settled. In 1788–89 he was receiving lessons from Palice, "a floral drawing master," from T. Malton, a perspective draughtsman, and from Hardwick, an architect. He also attended Paul Sandby's drawing school in St. Martin's Lane. Part of his time was employed in making drawings at home, which he exhibited for sale in his father's shop window, two or three shillings [50 to 75 cts.] being the usual price. He colored prints for engravers, washed in backgrounds for architects, went out sketching with Girtin, and made drawings in the evenings for Dr. Munro "for half a crown [60 cts.] and his supper." When pitied in after life for the miscellaneous character of his early work, his reply was "Well! and what could be better practice?" In 1789 Turner became a student of the Royal Academy. He also worked for a short time in the house of Sir Joshua Reynolds, with the idea, apparently, of becoming a portrait painter; but, the death of Reynolds occurring shortly afterwards, this intention was abandoned. In 1790[1] Turner's name appears for the first time in the catalogue of the Royal Academy, the title of his solitary contribution being "View of the Archbishop's Palace, Lambeth." About 1792 he received a commission from Walker, the engraver, to make drawings for his *Copper-Plate Magazine*, and this topographical work took him to many interesting places. The natural vigor of his constitution enabled him to cover much of the ground on foot. He could walk from 20 to 25 miles a day with ease, his baggage at the end of a stick, making notes and memoranda as he went. He rose early, worked hard all day, wasted no time over his simple meals, and his homely way of living made him easily contented with such rude accommodation as he chanced to find on the road. A year or two after he accepted a similar commission to make drawings for the *Pocket Magazine*, and before his twentieth year he had travelled over many parts of England and Wales. None of these magazine drawings are remarkable for originality of treatment or for artistic feeling.

Up to this time Turner had worked in the back room above his father's shop. His love of secretiveness and solitude had already begun to show itself. An architect who often employed him to put in backgrounds to his drawings says, "he would never suffer me to see him draw, but concealed all that he did in his bedroom." On another occasion, a visitor entering unannounced, Turner instantly covered up his drawings, and, in reply to the intimation, "I've come to see the drawings for ———," the answer was, "You shan't see 'em, and mind that next time you come through the shop, and not up the back way." Probably the increase in the number of his engagements induced Turner about this time to set up a studio for himself in Hand Court, not far from his father's shop, and there he continued to work till he was elected an associate of the Royal Academy (1799).

Until 1792 Turner's practice had been almost exclusively confined to water colors, and his early works show how much he was indebted to some of his contemporaries. There are few of any note whose style he did not copy or adopt. His first exhibited oil picture appeared in the Academy in 1793. In 1794–95 Canterbury Cathedral, Malvern Abbey, Tintern Abbey, Lincoln and Peterborough Cathedrals, Shrewsbury, and King's College Chapel, Cambridge, were among the subjects exhibited, and during the next four years he contributed no less than thirty-nine works to the Academy. In the catalogue of 1798 he first began to add poetic quotations to the titles of his pictures; one of the very first of these—a passage from Milton's *Paradise Lost*—is in some respects curiously prophetic of one of the future characteristics of his art.

> "Ye mists and exhalations that now rise
> From hill or steaming lake, dusky or gray
> Till the sun paints your fleecy skirts with gold,
> In honor of the world's great author rise."

This and several other quotations in the following years show that Turner's mind was now occupied with something more than the merely topographical element of landscape, Milton's *Paradise Lost* and Thomson's *Seasons* being laid under frequent contribution for descriptions of sunrise, sunset, twilight, or thunderstorm. Turner's first visit to Yorkshire took place in 1797. It seems to have braced his powers and possibly helped to change the student into the painter. Until then his work had shown very little of the artist in the higher sense of the term: he was little more than a painstaking and tolerably accurate topographer, but even under these conditions he had begun to attract the notice of his brother artists and of the critics. England was, at the time, at a low point both in literature and art. Among the artists De Loutherbourg and Morland were almost the only men of note left. Hogarth, Wilson, Gainsborough, and Reynolds had passed away. Beechey, Bourgeois, Garvey, Farington—names well-nigh forgotten now—were the Academicians who painted landscape. The only formidable rivals Turner had to contend with were De Loutherbourg and Girtin, and after the death of the latter in 1802 he was left undisputed master of the field.

[1] [Hamerton says the first exhibition was "Dover Castle" in 1787, but his authority apparently is Boone's Catalogue, in which the first two entries ascribe to our Turner the works of another person of the same name.—Am. Ed.]

It is not therefore surprising that the exhibition of his works in 1798 was followed by his election to the associateship of the Royal Academy. That he should have attained to this position before completing his twenty-fourth year says much for the wisdom and discernment of that body, which further showed its recognition of his talent by electing him an Academician four years later. Turner owed much to the Academy. Mr. Ruskin says, "It taught him nothing." Possibly it had little to teach that he had not already been able to learn for himself; at all events it was quick to see his genius and to confer its honors, and Turner, naturally generous and grateful, never forgot this. He enjoyed the dignity of Academician for nearly half a century, and during nearly the whole of that period he took an active share in the direction of the Academy's affairs. His speeches are described as "confused, tedious, obscure, and extremely difficult to follow;" but at council meetings he was ever anxious to allay anger and bitter controversy. His opinions on art were always listened to with respect; but on matters of business it was often difficult to know what he meant. His friend Chantrey used to say, "He has great thoughts, if only he could express them." When appointed professor of perspective to the Royal Academy in 1808, this painful lack of expression stood greatly in the way of his usefulness: he was often at a loss for words to express his ideas, and when he had recourse to his notes he found difficulty in reading them. Mr. Ruskin says, "The zealous care with which Turner endeavored to do his duty is proved by a series of large drawings, exquisitely tinted, and often completely colored, all by his own hand, of the most difficult perspective subjects, illustrating not only directions of line, but effects of light, with a care and completion which would put the work of any ordinary teacher to utter shame." In teaching he would neither waste time nor spare it. "If a student would take a hint, Turner was delighted and would go on with him giving hint after hint; if he could not follow, he left him. Explanations are wasted time; a man who can see understands a touch; a man who cannot misunderstands an oration." With his election to the associateship of the Academy in 1799, Turner's early struggles may be considered to have ended. He had emancipated himself from hack work, had given up making topographical drawings of castles and abbeys for the engravers—drawings in which mere local fidelity was the principal object—and had taken to *composing* as he drew. Local facts had become of secondary importance compared with effects of light and color. He had reached manhood, and with it he abandoned topographical fidelity and began to paint his dreams, the visionary faculty—the true foundation of his art—asserting itself, nature being used to supply suggestions and materials.

His pictures of 1797–99 had shown that he was a painter of no ordinary power, one having much of the poet in him, and able to give expression to the mystery, beauty, and inexhaustible fulness of nature. His work at this period is described by Mr. Ruskin as "stern in manner, reserved, quiet, grave in color, forceful in hand."

Turner's visit to Yorkshire in 1797 was followed a year or two later by a second, and it was on this occasion that he made the acquaintance, which afterwards ripened into a long and staunch friendship, of Fawkes of Farnley Hall. From 1803 till 1820 Turner was a frequent visitor at Farnley. The large number of his drawings still preserved there—English, Swiss, German, and Italian, the studies of rooms, outhouses, porches, gateways, of birds shot while he was there, and of old places in the neighborhood—prove the frequency of his visits and his affection for the place and for its hospitable master. A caricature, made by Fawkes, and "thought by old friends to be very like," shows Turner as "a little Jewish-nosed man, in an ill-cut brown tail-coat, striped waistcoat, and enormous frilled shirt, with feet and hands notably small, sketching on a small piece of paper, held down almost level with his waist." It is evident from all the accounts given that Turner's personal appearence was not of a kind to command much attention or respect. This may have pained his sensitive nature, and led him to seek refuge in the solitude of his painting room. Had he been inclined he had abundant opportunity for social and friendly intercourse with his fellow-men, but he gradually came to live more and more in a state of mental isolation, keeping himself to himself, entirely absorbed in his art. "This man must be loved for his works, for his person is not striking nor his conversation brilliant," is the testimony of Dayes, the water-color painter (and Girtin's master), in 1804. Turner could never make up his mind to visit Farnley again after his old friend's death, and his voice would falter when he spoke of the shores of the Wharfe.

Turner visited Scotland in 1800, and in 1801 or 1802 he made his first tour on the Continent. In the following year, of the seven pictures he exhibited six were of foreign subjects, among them Bonneville, the Festival upon the Opening of the Vintage of Mâcon, and the well-known Calais Pier in the National Gallery. The last-named picture, although heavily painted and somewhat opaque in color, is magnificently composed and full of energy. A better idea of its masterly composition can be formed from Mr. Seymour Haden's vigorous etching than from the picture itself, which is now greatly darkened by time.

In 1802, the year in which Turner became a Royal Academician, he took his old father, who still carried on the barber business in Maiden Lane, to live with him. The powder tax, imposed in 1795, drove out wigs and spoiled the old man's trade. "It is precisely," says Mr. Hamerton, "when the painter wins the full honors of the Academy—honors which gave a recognized and envied position in London society—that he takes his father home; a meaner nature would have tried to keep the old man at a safe distance." Turner's relations with his father were of the most dutiful and filial kind to the last.[1]

In 1804 Turner made a second tour on the Continent, and in the following year painted the Shipwreck and Fishing Boats in a Squall (in the Ellesmere collection), seemingly in direct rivalry of Vandervelde, in 1806 the Goddess of Discord in the Garden of the Hesperides (in rivalry of Poussin), and in 1807 the Sun rising through Vapor (in rivalry of Claude).[2] The last two are notable works, especially the Sun. In after years it was one of the works he left to the nation, on the special condition of its being hung beside the Claudes in the National Gallery. In this same year (1807) Turner commenced his most serious rivalry. Possibly it arose out of a desire to break down Claude worship, the then prevailing fashion, and to show the public that there was a living artist not unworthy of taking rank beside him. That the *Liber Studiorum* was suggested by the *Liber Veritatis* of Claude, and was intended as a direct challenge to that master, is beyond doubt. There is, however, a certain degree of unfairness to Claude in the way in which the challenge was given. Claude made drawings in brown of his

[1] Turner's father died in 1830, and the loss of "poor old Dad," as he used to call him, left a terrible void. He had lived in his son's house for nearly thirty years, looking after the frugal affairs of his household, and making himself useful in various ways. It is said that he used to prepare and strain his son's canvases and varnish them when finished, which may explain a saying of Turner's that "his father used to begin and finish his pictures for him." He also attended to the gallery in Queen Anne Street, showed in visitors, and took care of the dinner, if he did not himself cook it. Turner was never the same man after his father's death, living a life of almost complete isolation.

[2] This spirit of rivalry showed itself early in his career. He began by pitting himself against his contemporaries, and afterwards, when his powers were more fully developed, against some of the old masters, notably Vandervelde and Claude. During these years, while he kept up a constant rivalry with artists living and dead, he was continuing his unresting and untiring study of nature, and, while seemingly a mere follower of the ancients, was accumulating that immense store of knowledge which in after years, when his true genius asserted itself, he was to use to such purpose.

pictures as they left the easel, not for publication, but merely to serve as private memoranda. Turner's *Liber* drawings had no such purpose, but were intended as a direct appeal to the public to judge between the two artists. The first of the *Liber* drawings were made in the autumn of 1806, the others at intervals till about 1815. They are of the same size as the plates and carefully finished in sepia. About fifty of them are now to be seen in the Turner rooms of the National Gallery. The issue of the *Liber* began in 1807 and continued at irregular intervals till 1819, when it stopped at the fourteenth number. Turner had resolved to manage the publishing business himself, but in this he was not very successful. He soon quarrelled with his engraver, F. C. Lewis, on the ground that he had raised his charges from five guineas a plate to eight [$25.52 to $40.82]. He then employed Charles Turner, who agreed to do fifty plates at the latter sum, but, after finishing twenty, he too wished to raise his price, and, as a matter of course, this led to another quarrel. Reynolds, Dunkarton, Lupton, Say, Dawe, and other engravers were afterwards employed—Turner himself etching and mezzotinting some of the plates. Each part of the *Liber* contained five plates, the subjects, divided into "historical," "pastoral," "marine," etc., embracing the whole range of landscape art. Seventy-one plates in all were published (including one as a gift of the artist to his subscribers); ten other plates—more or less completed—intended for the fifteenth and sixteenth numbers were never published, the work being stopped for want of encouragement. Absence of method and of business habits may account for this. Turner is said to have got up the numbers in his own house with the help of a female servant. The plates, which cost the subscribers only five shillings [$1.21] apiece, were so little esteemed that in the early quarter of the 19th century they were sometimes used for lighting fires. So much has fashion, or public taste, changed since then that a fine proof of a single plate has sold for £210 [$1020.60]. The merit of the plates is unequal; some—for example, Solway Moss, Inverary Pier, Hind Head Hill, Ben Arthur, Rizpah, Junction of the Severn and Wye, and Peat Bog—are of great beauty, while a few are comparatively tame and uninteresting. Among the unpublished plates Stonehenge at Daybreak and Sheep Washing, Windsor Castle take a high place. The *Liber* shows strong traces of the influence of Cozens and Girtin, and, as a matter of course, of Claude. In most of the designs the predominant feeling is serious; in not a few, gloomy, or even tragic. A good deal has been written about Turner's intention, and the "lessons" of the *Liber Studiorum*. Probably his only intention in the beginning was to show what he could do, to display his art, to rival Claude, perhaps to educate public taste, and at the same time make money. If lessons were intended they might have been better conveyed by words. "Silent always with a bitter silence, disdaining to tell his meaning,"—such is Mr. Ruskin's explanation; but surely Turner had little reason for either silence or contempt because the public failed to see in landscape art the means of teaching it great moral lessons. The seventy plates of the *Liber* contain an almost complete epitome of Turner's art. Already in this work are seen strong indications of one of his most remarkable characteristics—a knowledge of the principles of structure in natural objects; mountains and rocks are drawn, not with topographical accuracy, but with what appears like an intuitive feeling for geological formation; and trees have also the same expression of life and growth in the drawing of stems and branches. This instinctive feeling in Turner for the principles of organic structure is treated of at considerable length in the fourth volume of *Modern Painters*, and Turner is there contrasted with Claude, Poussin, and some of the Dutch masters, greatly to their disadvantage.

After 1797 Turner was little concerned with mere topographical facts: his pictures might be like the places represented or not; much depended on the mental impression produced by the scene. He preferred to deal with the spirit, rather than with the local details of places. A curious example of the *reasonableness* accompanying his exercise of the imaginative faculty is to be found in his creations of creatures he had never seen, as, for example, the dragon[1] in the Garden of the Hesperides and the python in the Apollo, exhibited in 1811. Both these monsters are imagined with such vividness and reality, and the sense of power and movement is so completely expressed, that the spectator never once thinks of them as otherwise than representations of actual facts in natural history. It needs but a little comparison to discover how far Turner surpassed all his contemporaries, as well as all who preceded him, in these respects. The imaginative faculty he possessed was of the highest order, and it was further aided by a memory of the most retentive and unerring kind. A good illustration of this may be seen at Farnley Hall in a drawing of a Man-of-War taking in Stores. Some one, who had never seen a first-rate, expressed a wish to know what it looked like. Turner took a blank sheet of paper one morning after breakfast, outlined the ship, and finished the drawing in three hours, Fawkes sitting beside him from the first stroke to the last. The size of this drawing is about 16 in. by 11 in. Mr. Ruskin thus describes it:

"The hull of a first-rate occupies nearly one half of the picture to the right, her bows toward the spectator, seen in sharp perspective from stem to stern, with all her portholes, guns, anchors, and lower rigging elaborately detailed, two other ships of the line in the middle distance drawn with equal precision, a noble breezy sea, full of delicate drawing in its waves, a store-ship beneath the hull of the larger vessel and several other boats, and a complicated cloudy sky, all drawn from memory, down to the smallest rope, in a drawing-room of a mansion in the middle of Yorkshire."

About the year 1811 Turner paid his first visit to Devonshire, the county to which his family belonged, and a curious glimpse of his simple manner of life is given by Redding, who accompanied him on some of his excursions. On one occasion they spent a night together in a small road-side inn, Turner having a great desire to see the country around at sunrise.

"Turner was content with bread and cheese and beer, tolerably good, for dinner and supper in one. In the little sanded room we conversed by the light of an attenuated candle and some aid from the moon until nearly midnight, when Turner laid his head upon the table and was soon fast asleep. Three or four hours rest was thus obtained, and we went out as soon as the sun was up to explore the surrounding neighborhood. It was in that early morning Turner made a sketch of the picture Crossing the Brook." In another excursion to Borough Island, "the morning was squally and the sea rolled boisterously into the Sound. Off Stakes Point it became stormy; our Dutch boat rode bravely over the furrows. Two of the party were ill. Turner was all the while quiet, watching the troubled scene. Bolt Head, to seaward, against which the waves broke with fury, seemed to absorb his entire notice, and he scarcely spoke a syllable. While the fish were getting ready Turner mounted nearly to the highest point of the island rock, and *seemed writing rather than drawing*. The wind was almost too violent for either purpose."

This and similar incidents show how careless of comfort Turner was, and how devoted to his art. The tumult and discomfort by which he was surrounded could not distract his powers of observation; and some thirty years later there is still evidence of the same kind. In the catalogue of the exhibition of 1842 one

[1] "The strange unity of vertebrated action and of a true bony contour, infinitely varied in every vertebra, with this glacial outline, together with the adoption of the head of the Ganges crocodile, the fish-eater, to show his sea descent (and this in the year 1806, when hardly a single fossil saurian skeleton existed within Turner's reach), renders the whole conception one of the most curious exertions of the imaginative intellect with which I am acquainted in the arts" (Ruskin, *Mod. Painters*, vol. v. p. 313).

of his pictures bears the following title, "Snow-Storm: steamboat off a harbor's mouth making signals in shallow water, and going by the lead. The author was in that storm the night the 'Ariel' left Harwich."

From 1813 till 1826, in addition to his Harley Street residence, Turner had a country house at Twickenham. He kept a boat on the river, also a pony and gig, in which he used to drive about the neighboring country on sketching expeditions. The pony, for which Turner had a great love, appears in his well-known Frosty Morning in the National Gallery. He appears to have had a great affection for animals, and one instance of his tenderness of heart is given by one who often joined him in the amusement of fishing, of which Turner was very fond. "I was often with him when fishing at Petworth, and also on the banks of the Thames. His success as an angler was great, although with the worst tackle in the world. Every fish he caught he showed to me, and appealed to me to decide whether the size justified him to keep it for the table or to return it to the river; his hesitation was often almost touching, and he always gave the prisoner at the bar the benefit of the doubt."

In 1813, Turner commenced the series of drawings, forty in number, for Cooke's *Southern Coast*. This work was not completed till 1826. The price he at first received for these drawings was £7, 10s. [$36.45] each, afterwards raised to £13, 2s. 6d. [$63.79].

Crossing the Brook appeared in the Academy of 1815. It may be regarded as a typical example of Turner's art at this period, and marks the transition from his earlier style to that of his maturity. It represents a piece of Devonshire scenery, a view on the river Tamar. On the left is a group of tall pine-trees, beautifully designed and drawn with great skill and knowledge of structure, in the foreground a couple of children, with a dog carrying a bundle in its mouth across the brook, and beyond, a vast expanse of richly-wooded country, with glimpses of a winding river, an old bridge, a mill, and other buildings, and, in the far distance, the sea. Both in design and execution this work is founded upon Claude. Some critics consider it one of Turner's greatest works; but this is open to question.[1] It can hardly be called a work in full color: it is limited to grays and quiet greens for the earth and pale blues for the sky. It is a sober but very admirable picture, full of diffused daylight, and in the painting of its distance better than any master who had preceded him. The fascination of the remote, afterwards so distinctive an element in Turner's pictures, shows itself here. Perhaps nothing tests the powers or tries the skill of the landscape-painter more severely than the representation of distant effects. They come and go so rapidly, are often in a high key of light and color, and so full of mystery and delicacy, that anything approaching to real imitation is impossible. Only the most retentive memory and the most sensitive and tender feeling will avail. These qualities Turner possessed to a remarkable degree, and as his powers matured there was an ever-increasing tendency in his art to desert the foreground, where things were definite and clear, in order to dream in the infinite suggestiveness and space of distances. Dido Building Carthage also belongs to this period. It hangs beside the Claudes in the National Gallery. It pertains to the old erroneous school of historical painting. Towering masses of Claudesque architecture piled up on either side, porticoes, vestibules, and stone pines, with the sun in a yellow sky, represent the Carthage of Turner's imagination. With all its faults it is still the finest work of the class he ever painted. Carthage and its fate had a strange fascination for him. It is said that he regarded it as a moral example to England in its agricultural decline, its increase of luxury, and its blindness to the insatiable ambition of a powerful rival. He returned again to this theme in 1817, when he exhibited his Decline of the Carthaginian Empire: Hostages Leaving Carthage for Rome,—a picture which Mr. Ruskin describes as "little more than an accumulation of academy student's outlines colored brown."

In 1818, Turner was in Scotland, making drawings for the *Provincial Antiquities* for which Sir Walter Scott supplied the letterpress, and in 1819 he visited Italy for the first time.[2] One of the results of this visit was a great change in his style, and from this time his works became remarkable for their color. Hitherto he had painted in browns, grays, and blues, using red and yellow sparingly. He had gradually been advancing from the sober gray coloring of Vandervelde and Ruysdael to the mellow and richer tones of Claude. His works now begin to show a heightened scale of color, gradually increasing in richness and splendor and reaching its culminating point in such works as the Ulysses, Childe Harold's Pilgrimage, the Golden Bough, and the Fighting Téméraire. All these works belong to the middle period of Turner's art (1829–39), when his powers were entirely developed and entirely unabated. Much of his most beautiful work at this period is to be found in his water-color drawings: those executed for Whitaker's *History of Richmondshire* (1819–21), for Cooke's *Southern Coast* (1814–26), for *The Rivers of England* (1824), for *England and Wales* (1829–38), *Provincial Antiquities* (1826), Rogers's *Italy* (1830), Scott's *Works* (1834), and *The Rivers of France* (1833–35) are in many instances of the greatest beauty. Of the Richmondshire drawings Mr. Ruskin says, "The foliage is rich and marvellous in composition, the rock and hill drawing insuperable, the skies exquisite in complex form."

But perhaps one of the greatest services Turner rendered to the art of England was the education of a whole school of engravers. His best qualities as a teacher came from the union of strength and delicacy in his work; subtle and delicate tonality was almost a new element for the engraver to deal with, but with Turner's teaching and careful supervision his engravers by degrees mastered it more or less successfully, and something like a new development of the art of engraving was the result. No better proof can be found of the immense advance made than by comparing the work of the landscape engravers of the pre-Turnerian period with the work of Miller, Goodall, Willmore, Cooke, Wallis, Lupton, C. Turner, Brandard, Cousen, and others who worked under his guidance. The art of steel engraving reached its highest development in England at this time. Rogers's *Italy* (1830) and his *Poems* (1834) contain perhaps the most beautiful and delicate of the many engravings executed after Turner's drawings. They are vignettes,[3] a form of art which Turner understood better than any artist ever did before,—perhaps, we might add, since. The Alps at Daybreak, Columbus Discovering Land, and *Datur Hora Quieti* may be given as examples of the finest.

In 1828, Turner paid a second[2] visit to Italy, this time of considerable duration, on the way visiting Nîmes, Avignon, Marseilles, Genoa, Spezzia, and Siena, and in the following year he exhibited the Ulysses Deriding Polyphemus, now in the National Gallery. It marks the beginning of the central and best period of Turner's power. This work is so well

[1] Crossing the Brook was a great favorite with Turner. It was painted for a patron, who, dissatisfied with it, left it on the painter's hands. The price asked (£500) [$2430] seems to have been part of the objection. Turner subsequently refused an offer of £1600 [$7776] for it.

[2] [Hamerton says (p. 178, *Life of J. W. M. Turner*, Boston, 1879): "He visited Rome in 1813, he revisited it in 1819." The visit of 1823 was his third.—AM. ED.]

[3] "Of all the artists who ever lived I think it is Turner who treated the vignette most exquisitely, and, if it were necessary to find some particular reason for this, I should say that it may have been because there was nothing harsh or rigid in his genius, that forms and colors melted into each other tenderly in his dream-world, and that his sense of gradation was the most delicate ever possessed by man" (Hamerton).

known that description is hardly needed. The galley of Ulysses occupies the centre of the picture; the oars are being thrust out and the sailors flocking up the masts to unfurl sail, while Ulysses waves the blazing olive tree in defiance of the giant, whose huge form is seen high on the cliffs above; and the shadowy horses of Phœbus are traced in the slanting rays of the rising sun. The impression this picture leaves is one of great power and splendor. The painting throughout is magnificent, especially in the sky. Leslie speaks of it as "a poem of matchless splendor and beauty." From this period onward till about 1840 Turner's life was one of unceasing activity. Nothing is more astonishing than his prodigious fertility; he rose early, worked from morning till night, entirely absorbed in his art, and gradually became more and more solitary and isolated. Between 1829 and 1839 he sent fifty-five pictures to the Royal Academy, painted many others on private commission, made over four hundred drawings for engravers, besides thousands of studies and sketches from nature. His industry accounts for the immense quantity of work he left behind him. There is not the slightest evidence to show that it arose from a desire to make money, which he never cared for in comparison with his art. He has been accused, perhaps not without some cause, of avarice and meanness in his business dealings, and many stories are told to his discredit. But in private he often did generous things, although owing to his reserved disposition his virtues were known only to a few. His faults on the other hand—thanks to the malice, or jealousy, of one or two individuals—were freely talked about and, as a matter of course, greatly exaggerated. "Keep it, and send your children to school and to church," were the words with which he declined repayment of a considerable loan to a poor drawing-master's widow. On another occasion, when interrupted in his work, he roughly chid and dismissed the applicant, a poor woman; but she had hardly left his door before he followed her and slipped a £5 note into her hand. His tenants in Harley Street were in arrears for years, but he would never allow his lawyer to distrain; and if further proof of his generosity were needed his great scheme for bettering the condition of the unfortunate in his own profession should suffice. On one occasion he is known to have taken down a picture of his own from the walls of the Academy to make room for that of an unknown artist.

The first of Turner's Venetian pictures (Bridge of Sighs, Ducal Palace and Custom House, Venice, Canaletti Painting) appeared in the Academy in 1833. Compared with the sober, prosaic work of Canaletti, Turner's pictures of Venice appear like poetic dreams. Splendor of color and carelessness of form generally characterize them. Venice appeared to him "a city of rose and white, rising out of an emerald sea against a sky of sapphire blue." Many of these Venetian pictures belong to his later manner, and some of them, the Sun of Venice, Going to Sea (1843), Approach to Venice (1844), and Venice, Evening, Going to the Ball (1845), to his latest. As Turner grew older his love of brilliant color and light became more and more a characteristic. In trying to obtain these qualities he gradually fell into an unsound method of work, treating oil as if it had been water-color, using both indiscriminately on the same canvas, utterly regardless of the result. Many of his finest pictures are already in a ruined state, mere wrecks of what they once were.

The Fighting Téméraire Tugged to her Last Berth to be Broken up (see vol. xxi. p. 461, Fig. 43) was exhibited in the Academy of 1839. By many it is considered one of his finest works. Turner had all his life been half a sailor at heart: he loved the sea, and shipping, and sailors and their ways; many of his best pictures are sea pieces; and the old ships of Collingwood and Nelson were dear to him. Hence the pathetic feeling he throws around the fighting Téméraire. The old three-decker, looking ghostly and wan in the evening light, is slowly towed along by a black, fiery little steam tug,—a contrast suggesting the passing away of the old order of things and the advent of the new; and behind the sun sets red in a thick bank of smoke or mist. The Slave Ship, another important sea picture, was exhibited in the following year, and in 1842 Peace: Burial at Sea, commemorative of Wilkie.

Turner had now reached his sixty-seventh year, but no very marked traces of declining power are to be seen in his work. Many of the water-color drawings belonging to this period are of great beauty, and, although a year or two later his other powers began to fail, his faculty for color remained unimpaired almost to the end. He paid his last visit to the Continent in 1843, wandering about from one place to another, and avoiding his own countrymen, an old and solitary man. At his house in Queen Anne Street they were often ignorant of his whereabouts for months, as he seldom took the trouble to write to any one. Two years later (1845) his health gave way and with it both mind and sight began to fail. The works of his declining period exercised the wit of the critics. Turner felt these attacks keenly. He was naturally kindhearted and acutely sensitive to censure. "A man may be weak in his age," he once remarked, "but you should not tell him so."

After 1845 all the pictures shown by Turner belong to the period of decay,—mere ghosts and shadows of what once had been. In 1850 he exhibited for the last time. He had given up attending the meetings of the Academicians; none of his friends had seen him for months; and even his old housekeeper had no idea of his whereabouts. Turner's mind had evidently given way for some time, and with that love of secrecy which in later years had grown into a passion he had gone away to hide himself in a corner of London. He had settled as a lodger in a small house in Chelsea, overlooking the river, kept by his old Margate landlady, Mrs. Booth. To the children in the neighborhood he was known as "Admiral Booth." His short, sailor-like figure may account for the idea that he was an impoverished old naval officer. He had been ill for some weeks, and when his Queen Anne Street housekeeper at last discovered his hiding-place she found him sinking, and on the following day, the 19th December, 1851, he died. He was buried in St. Paul's cathedral, in deference to a wish he had himself expressed.

He left the large fortune he had amassed (about £140,000 [$680,400]) to found a charity for the "maintenance and support of male decayed artists, being born in England, and of English parents only, and of lawful issue." His pictures he bequeathed to the nation, on condition that they were to be exhibited in rooms of their own, and that these rooms were to be called "Turner's Gallery." The will and its codicils were so confused that after years of litigation, during which a large part of the money was wasted in legal expenses, it was found impossible to decide what Turner really wanted. A compromise was effected in which the wishes of everybody, save those of the testator, were consulted, his next-of-kin, whom he did not mean to get a single farthing, inherited the bulk of his property. The nation got all the pictures and drawings, and the Royal Academy £20,000 [$97,200].

It is unnecessary here to do more than allude to the charges which have been brought against Turner's moral character. Like most men of note he had his enemies and detractors, and it is to be regretted that so many of the stories they set in circulation should have been repeated by one of his biographers, who candidly admits having "spared none of his faults," and excuses himself for so doing by "what he hopes" is his "undeviating love of truth." The immense quantity of work accomplished by Turner during his lifetime, work full of the utmost delicacy and refinement, proves the singularly fine condition of his nervous system, and is perhaps the best answer that can be given to the charge of being excessively addicted to sensual gratification. In his declining years he possibly had re-

course to stimulants to help his failing powers, but it by no means follows that he went habitually to excess in their use. He never lost an opportunity of doing a kindness, and under a rough and cold exterior there was more good and worth hidden than the world imagined. "During the ten years I knew him," says Mr. Ruskin, "years in which he was suffering most from the evil-speaking of the world, I never heard him say one depreciating word of any living man or man's work; I never saw him look an unkind or blameful look; I never knew him let pass, without sorrowful remonstrance, or endeavor at mitigation, a blameful word spoken by another. Of no man but Turner, whom I have ever known, could I say this." Twice during his earlier days there are circumstances leading to the belief that he had thoughts of marriage, but on both occasions it ended in disappointment, and his home after his father died was cheerless and solitary, without solace or comfort of any kind.

If Turner had died early his reputation as an artist would have been very different from what it ultimately became. He would not have been recognized as a colorist. It was only after the year 1820 that color began to assert itself strongly in his work. He painted for many a year in grays and greens and browns, went steadily through "the subdued golden chord," and painted yellow mists and suns rising through vapor; but as time went on that was no longer enough, and he tried to paint the sun in his strength and the full glories of sunshine. The means at the painter's disposal are, however, limited, and Turner, in his efforts after brilliancy, began to indulge in reckless experiments in color. He could not endure even the slightest restraints which technical limitations impose, but went on trying to paint the unpaintable. As a water-color painter Turner stands pre-eminent; he is unquestionably the greatest master in that branch of art that ever lived. If his work is compared with that of Barrett, or Varley, or Cozens, or Sandby, or any of the earlier masters, so great is Turner's superiority that the art in his hands seems to be lifted altogether into a higher region.

In 1843 a champion, in the person of Mr. Ruskin, arose to defend Turner against the unjust and ignorant attacks of the press, and what at first was intended as a "short pamphlet, reprobating the manner and style of these critics," grew into the five volumes known as *Modern Painters*. The writer employs all his eloquence and his great critical faculty to prove how immeasurably superior Turner was to all who had ever gone before, hardly restricting his supremacy to landscape art, and placing him among the "seven supreme colorists of the world." Two lives of Turner have been written, one by Mr. Thornbury, the other by Mr. Hamerton. The work of the latter deserves the highest commendation; it gives a clear and consistent history of the great artist, and is characterized by refined thought and critical insight. An excellent little book by Mr. W. C. Monkhouse should also be noticed.

(G. RE.)

TURNHOUT, a town of Belgium, in the province of Antwerp, 25 miles east-northeast from Antwerp and 6 from the Dutch frontier, stands in the middle of a wide plain. It is a prosperous manufacturing and commercial centre, the chief industries being the weaving of cottons and linens (especially ticking), lace-making, paper-making, brick-making, dyeing, bleaching; there is also an establishment for the rearing of leeches. The population of the commune in 1876 was 15,743.

TURNING. See LATHE.

TURNIP. See AGRICULTURE, vol. i. pp. 325–327, and HORTICULTURE, vol. xii. p. 301.

TURNIP-FLY, TURNIP-FLEA, or EARTH FLEA-BEETLE, the name applied to several species of *Haltica* which infest turnip fields and do considerable damage to crops. The genus belongs to the family *Chrysomelidæ*, and includes about 100 species. The turnip-fly most usually met with, *Haltica nemorum*, is scarcely 2 mm. in length and of a shining black color, with two ochreous yellow longitudinal bands running along each wing-case; the bands are slightly sinuous and bend inwards at the hinder end. Of the eleven-jointed antennæ the first three segments are yellow and the remainder black. The coxæ are black, the rest of the legs having a yellowish hue. The coxæ and tibiæ are stout and formed for leaping, especially in the posterior pair of legs. The remarkable power of jumping has given rise to the name turnip-flea. The females are slightly longer and decidedly stouter than the males.

Turnip-fly (*Haltica nemorum*).

Another species, *H. concinna*, has a greenish yellow or brassy appearance, and the tibiæ of the two posterior legs are armed with a thorn-like hook. A third species, *H. consobrina*, is of a dark blue color above, whilst another species, *H. obscurella*, often very abundant, is of a lighter blue color, and larger than those mentioned above.

The life-history of *Haltica nemorum* may be taken as an example of that of the genus. The beetles begin pairing during April, and continue all through the summer. The female lays but few eggs, usually one a day. The eggs are deposited on the under surface of a leaf, close under one of the projecting veins; they possess a protective coloring. The development within the egg lasts ten days, at the end of which a small larva creeps out, and at once eats its way through the lower epidermis of the leaf into the mesophyll and there forms long winding burrows. The larva or maggot is of a yellowish color and somewhat cylindrical in form. It has three pairs of legs anteriorly and a pair of pro-legs at its hinder end. The most anterior and the most posterior segment bear a black spot. The mouth is provided with a pair of mandibles, by means of which the larva eats its way through the soft tissue of the leaf. This larval condition lasts about six days; the maggot then leaves the leaf and buries itself some one or two inches beneath the surface of the earth; here it turns into a chrysalis. From this the full-grown beetle emerges after an interval of fourteen days, and it is in this stage of its life-history that it proves most destructive to the turnip crop. Several broods may be produced each season; the beetle lives through the winter sheltered under fallen leaves, pieces of wood, clods of earth, etc., until the warmth of spring awakens it, when it soon begins to lay eggs.

Since the chief damage to the crop is due to the perfect beetle devouring the young leaves of the turnip plant, one of the most important methods of dealing with the pest is to ensure a strong and healthy growth of the plant, by means of manuring, watering, etc. Another preventative is the removal of such weeds as the shepherd's purse and charlock, which harbor the insect in great numbers, and the removal of any stubble in which it might pass the winter. When a crop is badly attacked dressings of soot and gas-lime mixed with sulphur and lime, or of soot or lime alone, prove efficacious, but these must be applied whilst the dew is on the leaves or the "fly" will escape.

TURNSTONE, the name long given[1] to a shore-bird, from its habit of turning over with its bill such stones as it can to seek its food in the small crustaceans or other animals lurking beneath them. It is the *Tringa interpres*[2] of Linnæus and *Strepsilas interpres* of most later writers, and is remarkable as being perhaps the most cosmopolitan of birds; for, though properly belonging to the northern hemisphere, there is scarcely a sea-coast in the world on which it may not occur: it has been obtained from Spitzbergen to the Strait of Magellan and from Point Barrow to the Cape of Good Hope and New Zealand—examples from the southern hemisphere being, however, almost invariably in a state of plumage that shows, if not immaturity, yet an ineptitude for reproduction. It also, though much less commonly, resorts to the margins of inland rivers and lakes; but it is very rarely seen except in the neighborhood of water, and salt water for preference.

The Turnstone is about as big as an ordinary Snipe; but, compared with most of its allies of the group *Limicolæ*, to which it belongs, its form is somewhat heavy, and its legs are short. Still it is brisk in its movements, and its

[1] The name seems to appear first in Willughby's *Ornithologia* (p. 231) in 1676; but he gave as an *alias* that of Sea-Dottrel, under which name a drawing, figured by him (pl. 58), was sent to him by Sir Thomas Browne.

[2] Linnæus (*Öl. och Gothländska Resa*, p. 217), who first met with this bird on the island of Gottland, 1st July, 1741, was under the mistaken belief that it was there called Tolk (=*interpres*). But that name properly belongs to the REDSHANK (*q.v.*), from the cry of warning to other animals that it utters on the approach of danger.

variegated plumage makes it a pleasing bird. Seen in front, its white face, striped with black, and broad black gorget attract attention as it sits, often motionless, on the rocks; while in flight the white of the lower part of the back and white band across the wings are no less conspicuous even at a distance. A nearer view will reveal the rich chestnut of the mantle and upper wing-coverts, and the combination of colors thus exhibited suggests the term "tortoise-shell" often applied to it — the quill-feathers being mostly of a dark brown and its lower parts pure white. The deeper tints are, however, peculiar to the nuptial plumage, or are only to be faintly traced at other times, so that in winter the adults—and the young always—have a much plainer appearance, ashy-gray and white being almost the only hues observable. From the fact that Turnstones may be met with at almost any season in various parts of the world,[1] and especially on islands as the Canaries, Azores, and many of those in the British seas, it has been inferred that these birds may breed in such places. In some cases this may prove to be true, but in most evidence to that effect is wanting. In America the breeding range of this species has not been defined. In Europe there is good reason to suppose that it includes Shetland; but it is on the northwestern coast of the continent, from Jutland to the extreme north of Norway, that the greatest number are reared. The nest, contrary to the habits of most *Limicolæ*, is generally placed under a ledge of rock which shelters the bird from observation,[2] and therein are laid four eggs, of a light olive-green, closely blotched with brown, and hardly to be mistaken for those of any other bird. A second species of Turnstone is admitted by some authors and denied by others. This is the *S. melanocephalus* of the Pacific coast of North America, which is said to be on the average larger than *S. interpres*, and it never exhibits any of the chestnut coloring.

Though the genus *Strepsilas* seems to be rightly placed among the *Charadriidæ* (*cf.* PLOVER), it occupies a somewhat abnormal position among them, and in the form of its pointed beak and its variegated coloration has hardly any very near relative. (A. N.)

TURPENTINE consists of the oleo-resins which exude from certain trees, especially from some conifers and from the terebinth tree, *Pistacia Terebinthus*, L. It was to the product of the latter, now known as Chian turpentine, that the term was first applied. The terebinth tree (τέρμινθος of Theophrastus) and its resin (ῥητίνη τερμίνθινη) were well known and highly prized from the earliest times. The tree is a native of the islands and shores of the Mediterranean, passing eastward into Central Asia; but the resinous exudation found in commerce is collected in the island of Scio. Chian turpentine is a tenacious semi-fluid transparent body, yellow to dull brown in color, with an agreeable resinous odor and little taste. On exposure to the air it becomes dry, hard, and brittle. In their general characters, turpentines are soft solids or semi-fluid bodies, consisting of a mixture of one or more resins with essential oils, which, although differing in physical properties, have a composition corresponding to the formula $C_{10}H_{16}$. They also contain minute quantities of oxygenated oils. Formerly they had considerable reputation in medicine, and they still continue to be employed in plasters and ointments; but their great use is in the arts, for which they are separated by distillation into rosin or colophony (see ROSIN, vol. xx. pp. 875–76) and oil or spirit of turpentine.

Crude or *common turpentine* is the commercial name which embraces the oleo-resin yielded by several coniferous trees, both European and American. The principal European product, sometimes distinguished as Bordeaux turpentine, is obtained from the sea pine, *Pinus maritima*, in the Landes department of France. Crude turpentine is further yielded by the Scotch fir, *P. sylvestris*, throughout northern Europe, and by the Corsican pine, *P. Laricio*, in Austria and Corsica. In the United States the turpentine-yielding pines are the swamp pine, *P. palustris*, and the loblolly, *P. Tæda*, both inhabiting North and South Carolina, Georgia, and Alabama. *Venice turpentine* is yielded by the large tree, *Larix europæa*, from which it is collected principally in Tyrol. *Strasburg turpentine* is obtained from the bark of the silver fir; but it is collected only in small quantities. Less known turpentines are obtained from the mountain pine, *P. Pumilio*, the stone pine, *P. Cembra*, the Aleppo pine, *P. halepensis*, etc. The so-called *Canada balsam*, from *Abies balsamea* (see BALSAM, vol. iii. p. 253), is also a true turpentine.

Oil of turpentine as a commercial product is obtained from all or any of these oleo-resins, but on a large scale only from crude or common turpentine. The essential oil is rectified by redistillation with water and alkaline carbonates, and the water which the oil carries over with it is removed by a further distillation over calcium chloride. Oil of turpentine is a colorless liquid of oily consistence, with a strong characteristic odor and a hot disagreeable taste. Its boiling point ranges from 152° [306° F.] to 172° C. [346° F.] at ordinary temperature; its sp. gr. is between 0.856 and 0.870; and in optical properties it rotates the plane of polarized light both to right and left in varying degrees according to its sources. It is soluble in alcohol, ether, benzol, other essential oils, and the fixed oils, and itself is a solvent of resins and caoutchouc. On exposure to the air it dries to a solid resin, and when oxidized in the presence of water gives off peroxide of hydrogen—a reaction utilized in the preparation of a disinfectant called "sanitas." Oil of turpentine is largely used in the preparation of varnishes, and as a medium by painters in their "flat" colors.

TURPIN, archbishop of Rheims and the supposititious author of *Historia Karoli Magni et Rotholandi*, is probably to be identified with Tilpin, who was archbishop of Rheims towards the end of the 8th century. This Tilpin is alluded to by Hincmar (845–882), his third successor in the see. According to Flodoard (*ob.* 969), Charles Martel drove Ragobert, bishop of Rheims, from his office, putting in his place a warrior-clerk, Milo. The same writer represents Milo as discharging a mission among the Vascones or Basques, the very people to whom authentic history has ascribed the great Carolingian disaster at Roncesvalles. It is possible that we owe the warlike legends that have accumulated round the name of Turpin to some confusion of his identity with that of his martial predecessor. Flodoard says that Tilpin was originally a monk of St. Denis; and we know from Hincmar that, after his appointment to Rheims, he occupied himself in securing the restoration of the metropolitan rights and landed property of his church, whose revenue and prestige had been impaired under Milo's rule. He was, according to the latter authority, elected in the days of Pippin, the son of Charles Martel, *i.e.*, between 752 and 768. He died, if we may trust the evidence of a diploma alluded to by Mabillon, in 794. Hincmar, who composed his epitaph, makes him bishop for forty years and more, from which it is evident that he was elected somewhere about 754. Flodoard, however, states that he died in the forty-seventh year of his bishopric. Tilpin was present at the synod of Rome in 769; and Pope Hadrian, at the request of Charlemagne, sent him a pallium and confirmed the rights of his church (*Gallia Christiana*, ix. 28–30). According to Flodoard, he substituted monks for canons in the monastery of St. Remigius; and 17th-century tradition ascribed to him an ancient *pontificale*, still extant in Marlot's days (17th century).

The above is a summary of all that authentic history and trustworthy tradition teach about the author to whom the common voice of the Middle Ages ascribed the *Historia Caroli Magni*. A short account of the work has been given elsewhere (ROLAND, LEGEND OF). But, popular as this production was during the Middle Ages, it was rather the crystallization of earlier Roland legends than the source of later ones. Potthast has enumerated about fifty codices without by any means, according to M. Gaston Paris, exhausting the list. The latter writer has made the *Historia Karoli* the subject of a special study (*De Pseudo-Turpino*, Paris, 1865), which may be recommended as a model of brilliant though cautious scholarship. The great popularity of the pseudo-Turpin seems to date from the latter half of the 12th century; and M. Paris enumerates at least five French translations belonging to the 13th, and one into Latin verse of about the same age. Mr. Ward (*Cat. of*

[1] The authors of *The Water Birds of North America* (i. p. 123) in reference to this fact raise the ingenious question, "Do birds, after they have become old, effete, or barren, prefer to stay in a warm climate?"

[2] There is little external difference between the sexes, and the brightly-contrasted colors of the hen-bird seem to require some kind of concealment.

Romances, 549) has recently expressed a doubt as to whether the Turpin chronicle was completed at Vienne.

TURQUOISE, a blue or bluish green mineral, valued, when cut and polished, as an ornamental stone. The finest variety occurs in Persia, whence it originally reached western Europe by way of Turkey, and thus came to be called by the Venetians, who imported it, *turchesa*, and by the French *turquoise*. It is chemically a hydrated phosphate of aluminium, associated with a variable proportion of hydrated phosphate of copper, to which it owes much of its color. The green tints of certain varieties appear to be due to admixture with salts of iron. A fine blue Persian turquoise, analyzed by Prof. A. H. Church, yielded—alumina 40.19, phosphorus pentoxide 32.86, water 19.34, cupric oxide 5.27, ferrous oxide 2.21, and manganous oxide 0.36. The most valued tint of the turquoise is a delicate blue, inclining slightly to green; in many specimens the green becomes more pronounced with age. Although the turquoise is practically opaque, sections may be ground so thin as to admit of examination by transmitted light. Its microscopic structure was first studied by Prof. Fischer of Freiburg (Baden), afterwards by H. Bücking of Strasburg, and recently by Clarke and Diller. Thin sections are almost colorless. Between crossed Nicols they show either a fibrous texture or a finely granular aggregate of doubly-refracting particles without definite crystalline outlines. The mineral has never been found crystallized, but occurs as veins, nodules, stalactitic masses, and incrustations. Large pieces are exceedingly rare. The specific gravity of turquoise is about 2.75, and its hardness below 6; it takes a fair polish and exhibits a feeble lustre. It is usually cut *en cabochon* or with a low convex surface, and in the East is frequently engraved with Persian and Arabic inscriptions, generally passages from the Koran,—the incised characters being in many cases gilt. Such objects are worn as amulets. The turquoise has always been associated with curious superstitions, the most common being the notion that it changes color with variations in the state of its owner's health, or even in sympathy with his affections.

Persia is the chief centre of the turquoise trade, where the same mines have been worked for at least eight centuries. The finest stones are found near Nishápúr in Khorásan (see PERSIA, vol. xviii. p. 633). Tavernier, writing in the 17th century, states that the best turquoise, reserved for the sole use of the shah, was obtained from the mine which he describes as the *Vieille Roche*, while inferior stones were got from the *Nouvelle Roche*. These terms still survive, all turquoise of fine color being said in trade to be from the "old rock," and that which is pale, or changes tint on exposure, is from the "new rock." According to a recent report by Consul Benjamin at Teheran the best turquoise is found at Abú Riáh, and all the Khorásan mines are farmed by a few prominent officials, who pay to the shah an annual rent of about £6500 [$31,590]. Dr. Tietze has lately described specimens of the matrix of the mineral brought to Vienna from Persia by General Schindler. These show that the turquoise occurs, not in clay-slate, as is often stated, but in a porphyritic trachyte or trachytic breccia, and in loose fragments in the neighboring alluvium. The mineral is also found in Kerman in southern Persia, but the stone is of pale color, tending to fade, and the mines which yield it are now nearly abandoned. In 1849 Major C. Macdonald found turquoise in Wady Maghara and Wady Sidreh, near SINAI (*q.v.*), where, according to Mr. H. Bauerman, it lines the open joints of a ferruginous sandstone, and is also embedded in small ochreous nodules in the rock itself. The redder the rock the finer the color of the associated turquoise. As the color is liable to fade, the Arabian turquoise has not a good name among jewelers, and the workings were abandoned by Macdonald in 1865. In Wady Maghara there are relics of extensive mining operations, presumably for turquoise, of so early a date that the rock was wrought by flint implements. The early inhabitants of Mexico made much use of this mineral for inlaying obsidian ornaments, and for mosaic work with iron-pyrites. It was probably one of the stones known as *chalchihuitl*. In 1858 Prof. W. P. Blake called attention to the occurrence of turquoise at Cerillos, about 22 miles southwest of Santa Fé, in New Mexico, where mining operations for this mineral were carried on two centuries ago. The turquoise varies in color from sky-blue to apple-green, and is found as nodules and small veins in a felspathic rock of microgranitic texture, probably of eruptive origin. The mines of Cerillos are no longer worked. A similar green mineral is found at Turquoise Mountain in Cochise county and at Mineral Park, Mohave county, Arizona. It also occurs to a small extent in southern Nevada, where it is found as blue grains disseminated through a sandstone. In Europe the turquoise is found at Oelsnitz in Saxony and near Jordansmühl in Silesia, occurring at the latter locality in clay-slate. Under the names of *callais* and *callaina* Pliny described a green mineral which, if not our turquoise, seems to have been very closely related to it. A bright green mineral, wrought into beads, and found with stone hatchets in ancient graves at Men-er Hrœck (Rock of the Fairy) in Brittany, was described in 1864 by M. Damour, who, seeking to identify it with Pliny's *callais*, revived this name. Dana afterwards brought the word into harmony with our mineralogical nomenclature by writing it callaiuite. The mineral in question is a hydrated phosphate of aluminium, apparently identical with Breithaupt's variscite. By many mineralogists the true turquoise is called calaite (see vol. xvi. p. 422).

Turquoise is commonly imitated by enamels, but of late some ingenious counterfeits have been made with the same chemical composition as the natural stone. To increase the deception, pieces of ochreous matter are inserted at the back of the artificial turquoise, to imitate the natural matrix. In order to distinguish between the genuine stone and its imitations, Pohl recommends that a splinter should be strongly heated in a platinum capsule, when the true turquoise is reduced to a brownish black powder or a friable mass with a decrepitating sound; the false turquoise does not decrepitate, but either fuses to a glass or is reduced to a frit.

For recent information on the turquoise, see "Das Vorkommen der Türkise bei Nischapur in Persien," by Dr. E. Tietze, in *Verhandl. d. k. k. geolog. Reichsanstalt*, No. 6, 1884, p. 93; "Mikroskopische Untersuchung des Türkis," by H. Bücking, in *Zeitsch. f. Krystallog.*, vol. ii., 1878, p. 163; "Eine einfache und sichere Unterscheidungsweise der echten Türkise von deren Nachahmungen," in *N. Jahrb. f. Mineralogie*, 1878, p. 364; "Turqois from New Mexico," by F. W. Clarke and J. S. Diller, in *Americ. Journ. Science*, Sept., 1886, p. 211; "Revision of Mineral Phosphates, No. iv., Calaite," by A. H. Church, in *Chem. News*, x. p. 290; and note in *Journ. Soc. Arts*, xxxii., 1884, p. 1084.

TURRETIN, or TURRETINI. Three theologians of this name figure in the history of Genevan Theology.

1. BENOIT TURRETIN (1588–1631), the son of Francesco Turretini, a native of Lucca, who settled in Geneva in 1579, was born in that town on 9th November, 1588. He was ordained a pastor in Geneva in 1612, and became professor of theology in 1618. In 1620 he represented the Genevan Church at the national synod of Alais, when the decrees of the synod of Dort were introduced into France; and in 1621 he was sent on a successful mission to the states general of Holland, and to the authorities of the Hanseatic towns, with reference to the defence of Geneva against the threatened attacks of the duke of Savoy. He published in 1618–20 a defence of the Genevan translation of the Bible. Benoit Turretin died at Geneva on 4th March, 1631.

2. FRANÇOIS TURRETIN (1623–87), son of the preceding, was born at Geneva on 17th October, 1623. After studying theology in Geneva, Holland, and France, he became a pastor in Geneva in 1647; after a brief pastorate at Leyden, he again returned to Geneva as professor of theology in 1653. He was one of the most influential supporters of the *Formula Consensus Helvetica*, drawn up chiefly by Heidegger, in 1675, and of the particular type of Calvinistic theology which that symbol embodied. His *Institutio Theologiæ Elencticæ* (3 vols. 4to, Geneva, 1680–83) has passed through frequent editions, the last reprint having been made in Edinburgh in 1847. F. Turretin died at Geneva on 28th September, 1687. He was also the author of volumes entitled *De Satisfactione Christi Disputationes* (Geneva, 1666) and *De Necessaria Secessione Nostra ab Ecclesia Romana* (Geneva, 1687).

3. JEAN ALPHONSE TURRETIN (1671–1737), son of the preceding, was born at Geneva on 13th August,

1671. He was educated at Geneva and in Holland, and after travelling in England and in France was received into the "Vénérable Compagnie des Pasteurs" of Geneva in 1693. In 1697 he became professor of church history. During the next forty years of his life he enjoyed great influence in Geneva as the advocate of a more liberal theology than had prevailed under the preceding generation, and it was largely through his instrumentality that the use of the *Formula Consensus Helvetica* as a symbol was discontinued in 1725. He also wrote and labored for the promotion of union between the Reformed and Lutheran Churches, his most important work in this connection being *Nubes Testium pro Moderato et Pacifico de Rebus Theologicis Judicio, et Instituenda inter Protestantes Concordia* (Geneva, 1719). Besides this he wrote *Cogitationes et Dissertationes Theologicæ*, on the principles of natural and revealed religion (Geneva, 1737); and commentaries on Thessalonians and Romans were published posthumously. He died at Geneva on 1st May, 1737.

TURTLE. See TORTOISE.

TUSCANY (Ital. *Toscana*), one of the sixteen compartimenti of the kingdom of Italy, contains eight provinces — Arezzo, Florence, Grosseto, Leghorn, Lucca, Massa-Carrara, Pisa, and Siena—and has an area of 9287 square miles, with a population of 2,208,869 in 1881. In 1859, immediately before it united with the kingdom of Sardinia, the grand-duchy of Tuscany, exclusive of Massa-Carrara, which then belonged to Modena, but including the islands of Gorgona, Elba, Pianosa, Formica, Montecristo, Giglio, and Gianutra, as well as the duchy of Lucca (united to it in 1847), had an area of 8625 square miles and a population of 1,806,940. See ITALY, vol. xiii. p. 447.

ETRURIA (*q.v.*) was finally annexed to Rome in 351 B.C. (see ROME), and constituted the seventh of the eleven regions into which Italy was, for administrative purposes, divided by Augustus. Under Constantine it was united into one province with Umbria, an arrangement which subsisted until at least 400, as the *Notitia* speaks of a "consularis Tusciæ et Umbriæ." In Ammianus Marcellinus there is implied a distinction between "Tuscia suburbicaria" and "Tuscia annonaria," the latter being that portion which lies to the north of the Arno. After the fall of the Western empire Tuscia, with other provinces of Italy, came successively under the sway of Herulians, Ostrogoths, and Greek and Lombard dukes. Under the last-named, "Tuscia Langobardorum," comprising the districts of Viterbo, Corneto, and Bolsena, was distinguished from "Tuscia Regni," which lay more to the north. Under Charlemagne the name of Tuscia or Toscana became restricted to the latter only. One of the earliest of the Frankish marquises was Boniface, either first or second of that name, who about 828 fought with success against the Saracens in Africa. Adalbert I., who succeeded him, in 878 espoused the cause of Carloman as against his brother Louis III. of France, and suffered excommunication and imprisonment in consequence. Adalbert II. (the Rich), who married the ambitious Bertha, daughter of Lothair, king of Lorraine, took a prominent part in the politics of his day. A subsequent marquis, Hugo (the Great), became also duke of Spoleto in 989. The male line of marquises ended with Boniface II. (or III.), who was murdered in 1052. His widow, Beatrice, in 1055 married Godfrey, duke of Lorraine, and governed the country till her death in 1076, when she was succeeded by MATILDA (*q.v.*), her only child by her first husband. Matilda died in 1114 without issue, bequeathing all her extensive possessions to the church. The consequent struggle between the popes, who claimed the inheritance, and the emperors, who maintained that the countess had no right to dispose of imperial fiefs, enabled the principal cities of Tuscany gradually to assert their independence and govern themselves under consuls and elders of their own selection. The most important of these Tuscan republics or self-governed communes were Florence, Pisa, Siena, Arezzo, Pistoia, and Lucca. Some account of the manner in which they were all gradually absorbed by Florence will be found under FLORENCE and MEDICI. The title of grand-duke of Tuscany was conferred on Cosmo de' Medici by Pius V. in 1569, and the emperor (Maximilian II.), after withholding his consent for some years, ultimately confirmed it to Cosmo's successor in 1576. In 1735, in view of the childlessness of Giovan Gastone, the last of the Medici, the succession of Francis, duke of Lorraine, afterwards emperor Francis I., was arranged for by treaty. In 1765 he was succeeded as grand-duke by his second son Leopold (see LEOPOLD II.), who, on becoming emperor in 1790, handed Tuscany over to his second son Ferdinand, third grand-duke of the name. The duchy was occupied by the French in 1799, ceded to Louis, prince of Parma, by the convention of Madrid in 1801, and annexed to the French empire in 1808. Ferdinand, however, was reinstated in 1814, and on his death in 1824 was succeeded by his son Leopold, second grand-duke of the name, who was deposed by the constituent assembly on 16th August, 1860. See ITALY.

TUSCULUM, an ancient Latin city, situated in a commanding position on one of the eastern ridges of the Alban Hills, near the site of the modern FRASCATI (*q.v.*). It has a very beautiful and extensive view of the Campagna, with Rome lying fifteen miles[1] distant to the northwest, on the west the sea near Ostia, and the long range of the Sabine Hills on the northeast. According to tradition, the city was founded by Telegonus, the son of Ulysses and Circe; hence Horace (*Epod.*, i. 30) speaks of it as "Circæa mœnia" and Ovid (*Fast.*, iii. 91) as "Telegoni mœnia" (see also Prop., iii. 30, 4, and Sil. Ital., xii. 535). The legendary descent of one of the chief Tusculan families, the gens Mamilia, from Ulysses through Telegonus is commemorated on some denarii struck by the Mamilian gens in the later years of the Roman republic; these have on the reverse a figure of Ulysses recognized by his dog Argo. When Tarquinius Superbus was expelled from Rome his cause was espoused by the chief of Tusculum, Octavius Mamilius, who took a leading part in the formation of the Latin League, composed of the thirty principal cities of Latium, banded together against Rome. Mamilius commanded the Latin army at the battle of Lake Regillus, a piece of water which then lay immediately below the Colles Tusculani, but is now dried up. At this battle (497 B.C.) Mamilius was killed, and the predominance of Rome among the Latin cities was practically established. From that time Tusculum became an ally of Rome, and on that account frequently incurred the hostility of the other Latin cities. In 378 B.C., after an expression of complete submission to Rome, the people of Tusculum received the Roman franchise, and thenceforth the city continued to hold the rank of a *municipium*. Several of the chief Roman families were of Tusculan origin, *e.g.*, the gentes Mamilia, Fulvia, Fonteia, Juventia, and Porcia; to the last-named the celebrated Catos belonged. During the imperial period little is recorded about Tusculum; but soon after the transference of the seat of empire to Constantinople it became a very important stronghold, and for some centuries its counts occupied a leading position in Rome and were especially influential in the selection of the popes. During the 12th century there were constant struggles between Rome and Tusculum, and towards the close of the century the Romans, supported by the German emperor, gained the upper hand, and the walls of Tusculum, together with the greater part of the city, were destroyed.

Extensive remains still exist of the massive walls, which surrounded the city, and of its arx—a separate citadel—which stood on an abrupt rock, approached only on one side, that towards the city, with which it was connected by long walls. The walls are built of large blocks of the native "lapis Albanus" or peperino, some of them as much as 5 feet long by 3 feet thick. They probably belong to the early republican period; restorations in concrete faced with "opus reticulatum" of the 1st century B.C. can be traced in many places.

During the latter years of the republic and under the empire Tusculum was a favorite site for the country villas of wealthy Romans. That of Lucullus was very large and magnificent; other handsome houses were built there by Julius Cæsar, L. Crassus, Q. Metellus, Marcus Brutus, and

[1] Dionysius (x. 20) states that Tusculum was only 100 stadia (about 12½ miles) from Rome; but the fifteenth milestone on the Via Latina was close to the walls of Tusculum.

others. A palace was erected by Tiberius near Tusculum on the way to Rome, close to the Via Latina.

The most interesting associations of the city are those connected with Cicero, whose favorite residence and retreat for study and literary work was at Tusculum. It was here that he composed his celebrated *Tusculan Disputations* and other philosophical works. Much has been written on the position of his villa, but its true site still remains doubtful. Its grounds are known to have adjoined the more splendid villas of Lucullus and the consul Gabinius (see Cic., *De Fin.*, iii. 2, and *Pro Dom.*, 24). The most probable site is that now marked by the Villa Rufinella to the west of Tusculum, where the hill is divided into two ridges. The scholiast on Horace, *Epod.*, i. 30, states that Cicero's villa was "ad latera superiora," the plural probably being used in allusion to the double ridge. The other theory, which places the site at Grotta Ferrata, some distance farther to the west, has little evidence to support it. Although Cicero (*Pro Sestio*, 43) speaks of his own house as being insignificant in size compared to that of his neighbor Gabinius, yet we gather from other notices in various parts of his works that it was a building of no mean size and pretension. It comprised two gymnasia (*Div.*, i. 5), with covered *porticus* for exercise and philosophical discussion (*Tusc. Disp.*, ii. 3). One of these, which stood on higher ground, was called "the Lyceum," and contained a library (*Div.*, ii. 3); the other, on a lower site, shaded by rows of trees, was called "the Academy." The main building contained a covered *porticus* or cloister, with apsidal recesses (*exedræ*) containing seats (see *Ad Fam.*, vii. 23). It also had bath-rooms (*Ad Fam.*, xiv. 20), and contained a number of works of art, both pictures and statues in bronze and marble (*Ep. ad Att.*, i. 1, 8, 9, 10). The central atrium appears to have been small, as Cicero speaks of it as an *atriolum* (*Ad Quint. Fr.*, iii. 1). The cost of this and the other house which he built at Pompeii led to his being burdened with debt (*Ep. Ad Att.*, ii. 1). Nothing now exists which can be asserted to be part of Cicero's villa with any degree of certainty. The so-called "scuola di Cicerone," near the line of the ancient wall of Tusculum, is the substructure of some building formed in the usual Roman way by a series of vaulted chambers, and is clearly later in date than the time of Cicero. Other remains of houses exist in and near the city, but nothing is known as to their history or ownership.

Ruins of two theatres still exist. One of them, which is not earlier than the beginning of the 1st century, between the city and the arx, is fairly perfect, and still possesses most of its ancient seats, divided into four *cunei* by three flights of steps. Only traces remain of the other theatre, which abutted against the long walls that defended the road from the city to the arx. Remains of an amphitheatre of no great size can be traced, dating probably from the 3d century. There is also a large *piscina*, near the first-mentioned theatre. In the vicinity of Tusculum a number of interesting tombs have been discovered at various times; some, as for example that of the Furii, contained valuable inscriptions of the 4th and 3d centuries B.C.

The city was supplied with water by the Aqua Crabra, and near it were the springs which fed two of the Roman aqueducts—the Aqua Tepula and Aqua Virgo (Front., *De Aq.*, 8).

For further information the reader is referred to Compagni, *Memorie Storiche dell' Antico Tusculo;* Canina, *Descr. dell' Antico Tusculo;* Gell, *Topogr. of Rome and its Vicinity;* and Nibby, *Dintorni di Roma*, vol. iii.

TUSSER, Thomas (*c.* 1527–1580), poet, was the son of William Tusser by Isabella, daughter of Thomas Smith of Rivenhall, Essex, where he was born about 1527. Notwithstanding strong reluctance on his part he was sent in his early years to a music school, and became chorister in the collegiate chapel of the castle of Wallingford. He was afterwards admitted into the choir of St. Paul's, and went thence to Eton, where he was under the tuition of Nicholas Udall. In 1543 he was elected to King's College, Cambridge, and soon afterwards exchanged to Trinity Hall. On leaving the university he was for about ten years at court, probably in some musical capacity. He then settled as a farmer in Suffolk, near the river Stour, an employment which he seems to have regarded as combining the chief essentials of human felicity. Subsequently he lived successively at Ipswich, West Dereham, Norwich, and London. There he died in April, 1580, and was buried in the church of St. Mildred in the Poultry. His monument was destroyed in the fire, but the quaint epitaph is preserved in Stow's *Survey of London*. A marble tablet, on which the epitaph is inscribed, has been erected to him in the church of Manningtree, Essex.

Tusser's poems on husbandry have the charm of simplicity and directness, and their practical saws were apparently relished, for in his lifetime they went through a number of editions. They are *A Hundreth Good Pointes of Husbandrie*, 1557, 1561, 1562, 1564, and 1570. *A Dialogue Wyuynge and Thryuynge*, 1562; *A Hundrethe Good Pointes of Husbandrie lately married unto a Hundrethe Good Pointes of Huswifry*, 1570; *Five Hundreth Pointes of Good Husbandrie united to as many of Good Wiferie*, 1573, 1576, 1577, 1585, 1586, 1590, 1593, repriuted with memoir by William Mavor, 1812, by Auber, 1873, and by the English Dialect Society, 1879. His metrical autobiography, printed in the appendix to *Five Hundreth Pointes*, 1573, was republished in 1846 along with his will, which would seem to refute the sarcasms which became current, that he had not been successful in practicing his own maxims. One of these references is contained in a volume of epigrams by H. P., *The More the Merrier*, 1608. One of the epigrams entitled *Ad Tusserum*, begins thus:

> "Tusser, they tell me, when thou wert alive,
> Thou, teaching thrift, thyselfe could'st never thrive."

Possibly Tusser obtained the reputation of being poor from his practice of thrift; but in any case, if his will represents his worldly condition at the time of his death, he was not in poverty in his later years.

TVER, a government of Central Russia, on the upper Volga, bounded by Pskoff and Novgorod on the W. and N., Yaroslavl and Vladimir on the E., and Moscow and Smolensk on the S.; it has an area of 25,225 square miles. Lying on the southern slope of the Valdai plateau, and intersected by deep valleys, it has the aspect of a hilly region, but is in reality a plateau ranging from 800 to 1000 feet in height. Its highest parts are in the northwest, where the Volga, Western Dwina, and Msta rise in marshes and lakes. The plateau is chiefly built up of Carboniferous limestones, Lower and Upper, underlain by Devonian and Silurian deposits, which appear only in the denudations of the lower valleys. The whole is covered by a thick sheet of boulder clay (the bottom-moraine of the Scandinavo-Russian ice-sheet) and subsequent lacustrine deposits. A number of åsar (see vol. x. p. 327) occur on the slopes of the plateau. Ochre, brick, and pottery clays, as also limestone for building, are obtained, and there are chalybeate springs. The soil, which is clayey for the most part, is not fertile as a rule.

Nearly the whole of Tver is watered by the upper Volga (350 miles) and its tributaries, several of which (Vaznza, Dubna, Sestra, Tvertsa, and the tributaries of the Mologa) are navigable. The Vyshnevolotsk system of canals connects the Volga (navigable some 60 miles from its source) with the Baltic, and the Tikhvin system connects the Mologa with Lake Ladoga. The Msta, which flows into Lake Ilmeñ, and its tributary the Tsna, water Tver in the northwest, and the Western Dwina rises in Ostashkoff. This network of rivers highly favors navigation: as many as 3000 boats yearly pass through the Vyshnevolotsk system, and corn, linseed, spirits, flax, hemp, timber, metals, and manufactured ware to the annual value of £1,500,000-[$7,290,000] are shipped from, or brought to, the river ports of the government. Lakes, ponds, and marshes are numerous in the west and northwest, Lake Seliger—the source of the Volga—and Lake Mstino being the most important. The forests—coniferous in the north and deciduous in the south—are rapidly disappearing, but still cover 890,000 acres. The climate is continental; the average yearly temperature at Tver (41.5° Fahr.) is the same as that of Orel and Tamboff (January 11°, July 67°). The population (1,646,683 in 1883, as against 1,567,300 in 1872) is unequally distributed, and in the districts of Kalyazin and Kashin attains a density not much less than that of the more highly favored black earth provinces of southeast Russia (16 and 17 per square mile). Apart from some 100,000 Karelians and a few Poles and foreigners, the people are all Great Russians. Some traces of Finnish Ves and of Lithuanians are found in the northeast and south. The official returns give the number of Raskolniks as 25,000. Only 157,110 are urban; but agriculture is not the chief occupation. While barley and oats are exported, rye is imported. The crops for 1883–88 averaged 2,889,400 quarters of corn and 4,078,400 bushels of

potatoes. Cattle-rearing does not prosper, and the increase shown by the returns for 1883 (351,630 horses, 583,670 cattle, and 373,780 sheep) as against those of 1872 is simply due to better registration. Cheese-making has recently been introduced on the co-operative principle (2168 cwts. of cheddar exported to Britain in 1881). The fisheries in the lakes and rivers are productive. The peasants are principally engaged in various manufactures. The total production of the larger manufactures in 1883 was valued at £2,237,250 [$10,873,035] (tanneries £244,460 [$1,188,075.60], cottons £803,270 [$3,903,892.20], distilleries £320,010 [$1,555,248.60], flour-mills £263,500 [$1,280,610]), and that of the petty trades carried on in combination with agriculture (preparation of pitch, tar, and turpentine, boat-building, construction of cars, sledges, wheels, boxes, tubes, and wooden vessels, and cabinet-making) was estimated in 1884 at £3,000,000 [$14,580,000], giving occupation to 101,400 persons. Certain branches of the leather industry are important, Kimry and Ostashkoff sending to the market £650,000 [$3,159,000] worth of boots annually. The small workshops of Tver and the surrounding district work some 4500 cwts. of iron into nails every year, and the Ostasbkoff smiths use some 7000 cwts. of iron annually in the manufacture of hatchets, scythes, sickles, and different agricultural implements. Weaving, lace-making, leather embroidery, stocking-making, felting, and the like are also important petty trades, several of these being organized on co-operative principles by the *zemstvos*. The railway from St. Petersburg to Moscow crosses Tver, and sends off two branches to Rzheff and to Rybinsk, all three lines being among the busiest in Russia. The river traffic also is considerable. The chief centres of trade, besides the city of Tver, are Byezhetsk, Rzheff, Kashin, Ostashkoff, Torshok, Krasnyi Kholm, and Vesiegonsk during its fair. The provincial assembly of Tver is one of the most prominent in Russia for its efforts in the cause of education and sanitary improvement. In 1883 there were 997 primary schools with 47,680 scholars (8500 girls), 17 gymnasia and progymnasia (1697 boys and 1263 girls), and two normal schools for teachers. The government is divided into twelve districts, the chief towns of which, with their populations in 1884, are—Tver (see below), Byezhetsk (5890), Kalyazin (5200), Kashin (5730), Kortcheva (2275), Ostashkoff (9900), Rzheff (26,480), Staritsa (2700), Torshok (12,910), Vesiegonsk (3370), Vyshniy Volotchok (11,590), and Znbtsoff (3160).

TVER, capital of the above government, lies 102 miles by rail to the northwest of Moscow, on both banks of the Volga (here crossed by a floating bridge) at its junction with the Tvertsa. The low right bank is protected from inundations by a dam. As a whole the town is but poorly built. The oldest church dates from 1564, and the cathedral from 1689. An imperial palace, the courts, and the post-office rank among its best buildings. A public garden occupies the site of the former fortress. The population was 39,100 in 1884. The manufactures, chiefly of cotton, employ 5900 workmen (5710 at the cotton mills), and a number of nail-making workshops employ some 800 men, while more than 1000 women are engaged in the domestic manufactory of hosiery for export to Moscow and St. Petersburg. The traffic of the town is considerable, Tver being an intermediate place for the trade of both capitals with the provinces of the upper Volga.

Tver dates its origin from 1180, when a fort was erected at the mouth of the Tvertsa to protect the Suzdal principality against Novgorod. In the 13th century it became the capital of an independent principality, and remained so until the end of the 15th century. Mikhail Yaroslavovitch, prince of Tver, was killed fighting against the Tatars, as also was Alexander Mikhailovitch, who boldly fought for the independence of Tver against Moscow. It long remained an open question whether Moscow or Tver would ultimately gain the supremacy in Great Russia, and it was only with the help of the Tatars that the princes of the former eventually succeeded in breaking down the independence of Tver. In 1486, when the city was almost entirely burned down by the Muscovites, the son of Ivan III. became prince of Tver; the final annexation to Moscow followed four years later. In 1570 Tver had to endure, for some reason now difficult to understand, the vengeance of Ivan the Terrible, who ordered the massacre of 90,000 inhabitants of the principality. In 1609–12 it was plundered both by the followers of the second false Demetrius and by the Poles.

TWEED, a river in the south of Scotland, has its rise in the southwest corner of Peeblesshire, not far from the Devil's Beef Tub in Dumfriesshire. The stream flowing from Tweed's Well, about 1500 feet above sea-level, is generally regarded as its source, although the honor is also claimed for other streams issuing from a higher elevation. For the first 36 miles of its course it intersects the county of Peebles—frequently on this account called Tweeddale—in a northeasterly direction, passing between verdant hills separated by valleys watered by its numerous affluents. Having passed several picturesque keeps and castles, it reaches the town of Peebles, shortly before which it receives the Lyne Water from the north and the Manor Water from the south. The valley now widens; the scenery becomes softer and richer; and the river, bending in a more easterly direction, passes Innerleithen, where it receives the Leithen from the north and the Quair from the south. It then crosses Selkirkshire in a southeasterly direction, and, having received the Ettrick from the south on the borders of Roxburghshire, flows northward past Abbotsford, forming for about 2 miles the boundary between the counties of Selkirk and Roxburgh. After receiving the Gala, the Tweed crosses the northwestern corner of Roxburghshire past Melrose and its abbey, and, after being joined by the Leader from the north, winds past Dryburgh abbey round the southwestern corner of Berwickshire. The remainder of its course is in a northeasterly direction through Roxburghshire past Kelso, where it receives the Teviot from the south, and then between the counties of Berwick and Northumberland, past Coldstream and Norham castle to the town of Berwick, where it reaches the North Sea. It receives the Eden Water from the north at Edenmouth, the Leet Water from the north at Coldstream, and the Till from Northumberland between Coldstream and Norham castle. The last 2 miles of its course before reaching Berwick are in England. Though the latter part of its course is through a comparatively level country, the scenery along the river is full of charm, owing to the picturesque variety of its finely wooded banks. The associations connected with the keeps and castles of the Tweed have supplied materials for several of Sir Walter Scott's poems and romances; and its varied beauties have been sung by Hogg, Leyden, Thomson, and many others. The bed of the river is pebbly and sandy, and, notwithstanding discolorations from manufactures, the stream, from its clear and sparkling appearance, is still well entitled to the name of the "silver Tweed." The total area drained by it is about 1870 square miles, and its total length is 97 miles. Next to the Tay it is the largest river in Scotland. The Tweed has, however, no estuary, and its traffic is chiefly confined to Berwick. But for a short distance up the river some navigation is carried on by barges. The river is one of the best in Scotland for trout and salmon fishing.

See Sir Thomas Dick Lauder's *Scottish Rivers* and Prof. Veitch's *River Tweed*, 1884.

TWELVE TABLES. See Roman Law, vol. xx. p. 697 *sq.*, and Rome, vol. xx. p. 756.

TWENTY-FOUR PARGÁNAS, the metropolitan district of the lieutenant-governorship of Bengal, India, takes its name from the territory originally ceded to the East India Company, which contained twenty-four pargánas or sub-districts. The district lies between 21° 55′ 20″ and 22° 57′ 32″ N. lat. and 88° 6′ 45″ and 88° 20′ 51″ E. long. It has an area of 2124 square miles, and is bounded on the North by Nadiyá, on the northeast by Jessore, on the south and southeast by the Sundarbans, and on the west by the river Húglí (Hooghly). The country consists for the most part of a vast alluvial plain within the delta of the Ganges, and is everywhere watered by numerous rivers, all branches of the Húglí. In the northern portion

the soil is very rich, but the southern or seaboard part consists of the network of swamps and inland channels known as the Sundarbans. The Húglí and six other streams are navigable by the largest boats throughout the year. The district is well supplied with canals, the most important being Tolly's Nala (10 miles long), which connects the Húglí with the Bidyádhárí. The Twenty-Four Pargánas was once famous for its sport, but owing to the extension of cultivation game is now scarce. Tigers are seldom met with; leopards are more numerous; there are several varieties of deer. The district has many roads, and is traversed by the Eastern Bengal Railway and the Calcutta and South-Eastern State Railway.

In 1881 the population of the district, exclusive of Calcutta, numbered 1,869,859 (males 975,430, females 894,429), embracing 1,153,040 Hindus, 701,306 Mohammedans, and 13,976 Christians. The ten following municipalities had each a population of upwards of 10,000—South Suburban, 51,658; Agarpara, 30,317; Barangar, 29,982; Naihati, 21,533; Nawabganj, 17,702; Basurhat, 14,843; South Dum Dum, 14,108; Baduria, 12,981; Rajpore, 10,576; and Barasat, 10,533. The administrative headquarters of the district are at Alipur, a southern suburb of Calcutta. Rice forms the staple crop of the district; other crops are pulses, oil seeds, sugar-cane, tobacco, etc. Its principal exports are rice, sugar, *pán* leaf, fish, pottery, etc.; the imports comprise pulses of all kinds, oil-seeds, spices, turmeric, chillies, cloth, cotton, etc. The objects of the rural manufacturers are sugar, cotton curtains, brass and iron work, horn sticks, and cotton and *tasar* silk cloth. The gross revenue of the district in 1885–86 amounted to £338,895 [$1,647,029.70], of which the land-tax contributed £155,181 [$734,739.66]. The district was ceded to the East India Company by treaty by the nawáb názím of Bengal in 1757. Since then several changes have been made in its boundaries, the latest in 1863.

TWICKENHAM, a town of Middlesex, England, is situated on the north bank of the Thames and on the London and Southwestern Railway, 11¼ miles southwest of London by rail. It is a straggling and irregular town, but has many fine suburban villas, and the district is noted for its sylvan beauty. Opposite the town there is an eyot in the river about 8 acres in extent, called Eel Pie Island, much resorted to by boating parties. The parish church of St. Mary was rebuilt in red brick in very plain style after the fall of the old one in 1713, but the picturesque western tower of the 14th century still remains. It contains many interesting monuments, including one to Pope, who was buried in the nave. The principal public buildings are the town-hall and assembly rooms (built in 1876, and containing the free library established in 1882), the economic museum, the royal naval female school for the daughters of naval and marine officers, the Montpellier lecture hall, the metropolitan and City of London police orphanage, the almshouses of the London Carpenters' Company, and a branch of the national refuge for the homeless and destitute. The population of the urban sanitary district (area 2415 acres) in 1871 was 10,533, and in 1881 it was 12,479.

Twickenham at Domesday was included in Isleworth. Anciently it was called Twitteuham or Twicanham. The manor was given in 941 by King Edmund to the monks of Christ Church, Canterbury, from whom it had been previously taken, but it was again alienated, for it was restored to the same monks by Edred in 948. In the reign of Henry VIII. it came into the possession of the Crown, and by Charles I. was assigned to Henrietta Maria as part of her jointure. It was sold during the Protectorate, but after the Restoration the queen mother resumed possession of it. In 1670 it was settled for life on Catherine of Braganza, queen of Charles II. It still remains in possession of the crown, but since the death of Catherine has been let on leases. In the neighborhood are many residences of literary or historical interest. Pope's villa, where he lived from 1717 till his death in 1744, has been removed. Among old mansions of interest still remaining are Strawberry Hill, the residence of Horace Walpole, now much altered; Marble Hill, built by George III. for the countess of Suffolk, and subsequently resided in by the marquis of Wellesley; Orleans House, built in the reign of Queen Anue by Johnstone, occupied for some time by the duke of Orleans, and from 1879 to 1883 as a club house; York House, said to have beeu the residence of James II. wheu duke of York, bestowed by Charles II. on Lord Clarendon when he married the duke of York's daughter, and in modern times resided in by the Comte de Paris; and Twickenham House, formerly the residence of Sir John Hawkins, author of the *History of Music*, and the meeting place of the "Literary Club." Of the old manor house of Twickenham, to which Catherine of Aragon is said to have retired after her divorce from Henry VIII., and which was subsequently the residence of Catherine of Bragauza, queen of Charles II., the only remains are a ruiu called the Aragon tower. Twickenham Park House, for some time the residence of Lord Chancellor Bacon, has been demolished.

TWILIGHT. The light of what is called the "sky" depends upon the scattering or reflection of direct sunlight in the earth's atmosphere, mainly if not entirely due to those fine dust particles which (as we have recently learned) form the necessary nuclei for condensation of aqueous vapor. Were it not for these particles the sky would appear by day as it does in a clear winter night, and the stars would be always visible. Alpine climbers and aeronauts, when they have left the grosser strata of the atmosphere below them, find this state of things approximated to; and even at the sea-level the blue of the sky is darker when the air contains but few motes. After the sun has set, its rays continue for a time to pass through parts of the atmosphere above the spectator's horizon, and the scattered light from these is called twilight. It is, of course, most brilliant in the quarter where the sun has set. Before sunrise we have essentially the same phenomenon, but it goes by the name of "dawn." The brilliancy of either depends upon several conditions, of which the chief is, of course, the degree by which the sun has sunk below the horizon. But the amount of dust in the air affects the phenomenon in two antagonistic ways: it diminishes the amount of sunlight which reaches the upper air after passing close to the earth and it increases the fraction of this light which is scattered to form twilight. Hence no general law can be laid down as to the duration of twilight; but it is usual to state (roughly) that it lasts until the sun is about 18° under the horizon. If we make this assumption, it is a simple matter of calculation to solve questions as to the duration of twilight at a given place at a given time of year, the maximum duration of twilight at a given place, etc. In the older works on astronomy such questions were common enough, but they have now little beyond antiquarian interest. The more complex phenomena of twilight, such as the "after-glow," etc., probably depend upon the precipitation of moisture on the dust particles as the air becomes gradually colder. This will of course alter the amount of scattering; but it may also lead (by reflection from strata of such particles) to an increase in the amount of light to be scattered.

TYCHO BRAHE. See Brahe.

TYLDESLEY WITH SHAKERLEY, a town of Lancashire, England, is situated on a considerable eminence, 11 miles west-northwest of Manchester and 199 northwest of London (by the London and Northwestern Railway). The church of St. George, a handsome building in the Early Pointed style, erected in 1827, has lately undergone restoration. Public baths were built in 1876. A public cemetery was formed in 1878. The town is the growth of the 19th century and depends upon its cotton-mills and the large collieries in the neighborhood. It is governed by a local board of health of sixteen members. The population of the urban sanitary district (area 2490 acres) in 1871, was 6408 and in 1881 it was 9954.

At Domesday Tyldesley formed part of the manor of Warrington. One of its proprietors, Sir Thomas Tyldesley, was a distinguished Royalist. His son Edward in 1672 sold the manor to Ralph Astley, and from the Astleys it passed in 1728 to Thomas Johnson of Bolton. In 1823 it became the property of George Ormerod, author of the *History of Cheshire*.

TYLER, JOHN (1790–1862), tenth president of the United States, was accustomed with pride, but with the support of conjecture rather than evidence, to claim relationship with Wat Tyler of the reign of Richard II. The earliest of his American ancestors was Henry Tyler, a reputed native of Shropshire, England, who, in 1652, settled at Middle Plantation, Va., on the outskirts of what is now the city of Williamsburg. John Tyler was the son of Judge John Tyler, some time governor of Virginia, and was born at Greenway in that State, 29th March, 1790. In 1802 he entered the grammar school of William and Mary, where, though fond of fun and frolic and cultivating an inherited taste for the violin, he made good progress in his studies. After graduating in 1806, he entered on the study of law, and in 1809 was called to the bar, where his progress from the first was rapid. He became a member of the state legislature in December, 1811. In 1813 he raised a company in defence of Richmond, in command of which he subsequently served with the fifty-second regiment at Williamsburg and Providence Forge. In December, 1816, he was elected to the house of representatives at Washington, where he displayed much readiness and skill in debate as an uncompromising advocate of popular rights. In 1825 he was elected governor of Virginia by a large majority, and the following year was re-elected unanimously. In 1827 he was chosen a senator. He opposed Clay on the tariff question in 1832, delivering a speech against the protective duties which lasted three days; but he voted for Clay's Compromise Bill of 1833. He was the only senator who voted against the Force Bill on 20th February of this year, a singularity of conduct which somewhat damaged his reputation in Virginia. Although opposed to the establishment of the United States Bank, he supported the resolutions in 1835 censuring President Jackson for the removal of the deposits, on the ground that the procedure was unconstitutional. In consequence of a vote of the Virginia legislature instructing him to vote for the expurgation of these resolutions from the senate journal he resigned 21st February, 1836. His action led the Whigs to bring him forward as a candidate for the vice-presidency, but he only received forty-seven votes. For some time after this he ceased to take an active part in politics; removing in the end of the year from Gloucester to Williamsburg, where he had better opportunities for legal practice, he devoted his chief attention to his professional duties. At the Whig convention, which met at Harrisburg, Pennsylvania, 4th December, 1839, he was nominated again for the vice-presidency on the Harrison ticket, and elected in November, 1840. On the death of Harrison, soon after his inauguration in 1841, Tyler succeeded him. His elevation to the presidency was thus accidental in a double sense, for he had been nominated for the vice-presidency to reconcile the extreme faction. His policy in office (see UNITED STATES) was opposed to the party who nominated him and was on Democratic lines. In 1845 he was succeeded by Polk, and he spent the remainder of his life in retirement from active duties. He was nominated in 1861 for the lower house of the permanent congress, but died at Richmond on the 18th of the following January.[1]

See L. G. Tyler, *Life and Times of the Tylers*, 2 vols., 1884.

TYNDALE, WILLIAM (*c.* 1484–1536), translator of the New Testament and Pentateuch (see ENGLISH BIBLE, vol. viii. pp. 344, 345), was born in Gloucestershire, possibly in the parish of Slimbridge, about the year 1484. Of his early education nothing is known; about his twentieth year he went to Oxford, where tradition has it that he was entered of Magdalen Hall. He afterwards resided at Cambridge. Ordained to the priesthood, probably towards the close of 1521, he entered the household of Sir John Walsh, Little Sodbury, Gloucestershire, in the capacity of chaplain and domestic tutor. Here he spent two years, and in the course of his private studies began to contemplate seriously the work of translating the New Testament into English. His sympathy with the "new learning," which he had not concealed in conversation with the higher clergy of the neighborhood at Sir John's table, led to his being summoned before the chancellor of Worcester as a suspected heretic; and "with the goodwill of his master" he left for London in the summer of 1523. There he preached a little at St. Dunstan-in-the-West, and worked at his translation, living for some months in the house of Humphrey Monmouth, an alderman; but finding publication impossible in England he sailed for Hamburg in May, 1524. After visiting Luther at Wittenberg, he settled in Cologne, where he made some progress with a quarto edition of his New Testament, when the interference of the authorities of the town compelled his flight to Worms. The octavo edition (see vol. viii. p. 344) was here completed in 1526. Where Tyndale resided in the interval between 1526 and 1530—the year of publication of his translation of the Pentateuch—is not known; his *Parable of the Wicked Mammon* (1527), *Obedience of a Christian Man* (1528), and *Practice of Prelates* (1530), all bear to have been printed at "Marlborowe in the land of Hesse" or "Marborch." From 1530 onwards he appears to have lived chiefly in Antwerp, but of his life there hardly anything is recorded, except that as a marked man he was continually the subject of plots and intrigues, and that at last he was arrested and thrown into prison in the castle of Vilvorde, some six miles from Brussels, in 1535. Having been found guilty of heresy, he was put to death by strangling, and his body afterwards burnt at the stake on October 6, 1536.

The *Works* of Tyndale were first published along with those of FRITH (*q.v.*) and Barnes, "three worthy Martyrs and principal Teachers of the Church of England," by John Daye, in 1573 (folio). His *Doctrinal Treatises and Introductions to Different Portions of the Holy Scripture* were published by the Parker Society in 1848. For biography, see Demaus, *William Tyndale* (London, 1871); also the Introduction to Mombert's critical reprint of Tyndale's Pentateuch (New York, 1884), where a full bibliography is given. There seems no reason to doubt that the translation of Joshua, Judges, Samuel, Kings, and Chronicles in Matthew's Bible is substantially the work of Tyndale.

TYNE, a river in the northeast of England, is formed of two branches, the North Tyne, rising in the Cheviots on the borders of Roxburgh, and the South Tyne, rising at Tynehead Fell, at the southeastern extremity of Cumberland. The North Tyne flows southeastwards by Bellingham, a short distance below which it receives the Rede from the north, and 2 miles above Hexham it is joined by the South Tyne, which before the junction flows northward to Haltwhistle, and then eastward, receiving the Allen from the right a short distance above Haydon Bridge. The united streams then have a course of about 30 miles eastwards to the sea at Tynemouth. For a considerable part of its course the Tyne flows through a pleasant and richly cultivated country, but in its lower reaches the presence of coal pits has almost completely robbed the scenery of its natural charms, and the former sylvan retreats of monks and abbots are now occupied by blast furnaces and shipbuilding yards, and similar scenes of busy industry, which line both banks of the river from Newcastle to the sea. The river is navigable to Blaydon for small craft, and to Newcastle, 8 miles from its mouth, for large vessels.

The coal trade of the Tyne is the most important in England, and for its general shipping trade the river ranks next in importance to the Thames and the Mersey. The principal ports are Newcastle and North and South Shields, but below Newcastle the river is everywhere studded with piers and jetties. About a seventh of the whole tonnage of vessels built in England is built on the Tyne, the most im-

[1] [He was elected to the Confederate Congress in 1861, here called permanent to distinguish it from the Montgomery (Ala.) Provisional Congress. He died on the 17th January.—AM. ED.]

portant works being those of Jarrow. For boat-racing the Tyne vies in celebrity with the Thames.

TYNEMOUTH, a municipal and parliamentary borough of England, in Northumberland, includes the townships of Chirton, Cullercoates, North Shields, Preston, and Tynemouth. This last, the principal watering-place on this part of the coast, is picturesquely situated on a promontory on the north side of the Tyne at its mouth. It is connected with Newcastle, 8 miles to the west-southwest, by a branch of the North-Eastern Railway; its distance from London is 273½ miles by rail. The town has rapidly increased within recent years, and contains many well-built streets, squares, and villas. On the point of the promontory there is a small battery, called the Spanish battery, and near it a monument has been erected to Lord Collingwood. Within the grounds to which the gateway of the old castle gives entrance are the ruins of the ancient priory of St. Mary and St. Oswin—the principal remains being those of the church. A pier, half a mile long, serves as a breakwater to the harbor. Among the principal public buildings are the assembly rooms and the aquarium (1872). The municipal buildings of the borough of Tynemouth are situated in North Shields, where are also the custom house, a master mariners' home, a seamen's institute, and a sailors' home founded by the late duke of Northumberland. Shipbuilding is carried on, and there are rope and sail works. The fish trade is of considerable importance and employs several steam and sailing boats. The population of the municipal and parliamentary borough of Tynemouth (incorporated in 1849; area 4303 acres), divided into the three wards of North Shields, Percy, and Tynemouth, was 38,941 in 1871, and 44,118 in 1881.

Tynemouth was a fortress of the Saxons, and was anciently known as Peubal Crag, "the head of the rampart on the rock." From remains found in 1783 it is supposed to have been a Roman station. The first church was built of wood by Edwin, king of Northumbria, about 625, and was rebuilt in stone by his successor Oswald in 634. The body of Oswin, king of Deira, was brought hither for burial in 651, and on this account Tynemouth came to be in great repute as a place of burial both for royal and ecclesiastical persons. The monastery was repeatedly plundered and burnt by the Danes, especially during the 9th century. After its destruction by Healfdeane in 876 it was rebuilt by Tostig, earl of Northumberland, who endowed it with considerable revenue; but, having been granted in 1074 to the monks of Jarrow, it became a cell of Durham. Malcolm III., king of the Scots, and his son Edward, who were slain in battle at Alnwick on 13th November, 1093, were both interred in the monastery. In 1095 Earl Mowbray, having entered into a conspiracy against William Rufus, converted the monastery into a castle, which he strongly fortified. By William Rufus the priory was conferred on St. Albans abbey, Hertfordshire. It was surrendered to Henry VIII. on 12th January, 1539, and the site and remains were granted by Edward VI. in 1550 to the earl of Warwick, afterwards duke of Northumberland. In 1644 the castle was taken by the Scots under the earl of Leven. The town enjoyed various immunities at a very early period, which were afterwards the subject of some dispute. Edward I. restored to it several free customs of which it had been deprived. Afterwards it received a confirmation of its various former charters by Edward II. and Richard II.

TYPE-FOUNDING. See TYPOGRAPHY.

TYPE-WRITING. See WRITING MACHINES.

TYPHON, or TYPHOEUS, son, according to Hesiod (*Theog.*, 820 *sq.*), of the Earth and Tartarus, is described as a grisly monster with a hundred dragons' heads who was conquered and cast into Tartarus by Zeus. According to *Iliad* ii. 282, he lies in the land of the Arimi (Cilicia). Other legends place his prison under Ætna or in other volcanic regions and make him the cause of eruptions. The myth, therefore, as we have it, rests on a personification of volcanic forces. He is the father of dangerous winds (typhoons), and by later writers is identified with the Egyptian Set (see vol. vii. p. 620).

TYPHUS, TYPHOID, AND RELAPSING FEVERS. These are conveniently considered together, as they constitute the important class of continued fevers, having certain characters in common, although each is clearly distinguishable from the others. The following is a general account of the more salient features of each.

TYPHUS FEVER.

Typhus[1] is a continued fever of highly contagious nature, lasting for about fourteen days and characterized mainly by great prostration of strength, severe nervous symptoms, and a peculiar eruption on the skin. It has received numerous other names, such as spotted, pestilential, putrid, jail, hospital fever, etc. It appears to have been known for many centuries as a destructive malady, frequently appearing in epidemic form, in all countries in Europe, under the conditions to be afterwards referred to. The best accounts of the disease are those given by English writers, who narrate its ravages in towns and describe many "black assizes," in which it was communicated by prisoners brought into court to the judges, jurymen, court-officials, etc., with fatal effect, producing oftentimes a widespread consternation. Typhus fever would seem to have been observed in almost all parts of the world; but, although not unknown in warm countries, it has most frequently prevailed in temperate or cold climates.

Predisposing and exciting causes.

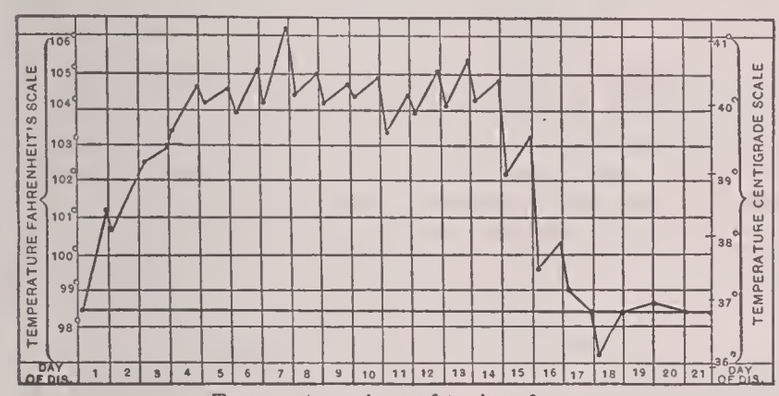
The causes concerned in its production include both the predisposing and the exciting. Of the former the most powerful of all are those influences which lower the health of a community, especially overcrowding and poverty. Hence this fever is most frequently found to affect the poor of large cities and towns, or to appear where large numbers of persons are living crowded together in unfavorable hygienic conditions, as has often been seen in prisons, workhouses, etc. Armies in the field are also liable to suffer from this disease; for instance, during the Crimean War it caused an enormous mortality among the French troops. Some high authorities, including Dr. Murchison, have held that such conditions as those referred to are capable of generating typhus fever by themselves, and the apparent occasional *de novo* origin of this disease has doubtless the support of many striking facts which would appear to favor this view (see PATHOLOGY, vol. xviii. p. 413). In the light, however, of recent researches into the relation of specific disease germs to the production of fevers and other infectious maladies, there is increasing difficulty in maintaining this position; and the direction of opinion is decidedly towards the view that, however much insanitary conditions and overcrowding act as causes predisposing to the reception of the disease, the introduction into the system of a living organism or germ is necessary to the manifestation of the phenomena of the fever. Nevertheless no specific organism has yet been clearly identified in the case of typhus fever. This disease is now much less frequently encountered in medical practice than formerly,—a fact which must mainly be ascribed to the great attention which in recent times has been directed to improvement in the sanitation of towns, especially to the opening up of crowded localities so as to allow the free circulation through them of fresh air. In most large cities, however, limited epidemic outbursts of the disease occur from time to time, under the conditions of overcrowding and poverty, although the increased facilities possessed by local authorities for recognizing such outbreaks, and for the prompt isolation or removal of infected persons to hospitals, operate in general effectually to prevent any extensive spread of the fever. All ages are liable to typhus, but the young suffer less severely than the old. The disease appears to be communicated by the exhalations given off from the bodies of those suffering from the fever, and those

[1] From τῦφος, smoke or mist, in allusion to the stupor of the disease.

most closely in contact with the sick are most apt to suffer. This is shown by the frequency with which nurses and physicians take typhus from cases under their care. As in all infectious maladies, there is often observed in typhus a marked proclivity to suffer in the case of individuals, and in such instances very slight exposure to the contagion may convey the disease. Typhus is highly contagious throughout its whole course and even in the early period of convalescence. The contagion, however, is rendered less active by the access of fresh air; hence this fever rarely spreads in well-aired rooms or houses where cases of the disease are under treatment. As a rule one attack of typhus confers immunity from risk of others, but numerous exceptions have been recorded.

Course of the fever.

The course of typhus fever is characterized by certain well-marked stages. (1) The stage of *incubation*, or the period elapsing between the reception of the fever poison into the system and the manifestation of the special evidence of the disease, is believed to vary from a week to ten days. During this time, beyond feelings of languor, no particular symptoms are exhibited. (2) The *invasion* of the fever is in general well marked and severe,



Temperature chart of typhus fever.

in the form of a distinct rigor, or of feelings of chilliness lasting for hours, and a sense of illness and prostration, together with headache of a distressing character and sleeplessness. Feverish symptoms soon appear and the temperature of the body rises to a considerable height (103°–105° Fahr.), at which it continues with but little daily variation until about the period of the crisis. It is, however, of importance to observe certain points connected with the temperature during the progress of this fever. Thus about the seventh day the acme of the fever heat has been reached, and a slight subsidence (1° or less) of the temperature takes place in favorable cases, and no further subsequent rise beyond this lowered level occurs. When it is otherwise the case often proves a severe one. Again, when the fever has advanced towards the end of the second week, slight falls of temperature are often observed, prior to the extensive descent which marks the attainment of the crisis. The pulse in typhus fever is rapid (100–120 or more) and at first full, but later on feeble. Its condition as indicating the strength of the heart's action is watched with anxiety. The tongue, at first coated with a white fur, soon becomes brown and dry, while sordes (dried mucus, etc.) accumulate upon the teeth; the appetite is gone and intense thirst prevails. The bowels are as a rule constipated, and the urine is diminished in amount and high-colored. The physician on examination may make out distinct enlargement of the spleen. (3) The third stage is characterized by the appearance of the *eruption* which generally shows itself about the fourth or fifth day or later, and consists of dark red (mulberry colored) spots or blotches varying in size from mere points to three or four lines in diameter, very slightly elevated above the skin, at first disappearing on pressure, but tending to become both darker in hue and more permanent. They appear chiefly on the abdomen, sides, back, and limbs, and occasionally on the face. Besides this, the characteristic typhus rash, there is usually observed a general faint mottling all over the surface. The typhus rash is rarely absent and is a very important diagnostic of the disease. In the more severe and fatal forms of the fever, the rash has all through a very dark color, and slight subcutaneous hæmorrhages (*petechiæ*) are to be seen in abundance. After the appearance of the eruption the patient's condition seems to be easier, so far as regards the headache and discomfort which marked the outset of the symptoms; but this is also to be ascribed to the tendency to pass into the typhous stupor which supervenes about this time, and becomes more marked throughout the course of the second week. The patient now lies on his back, with a dull dusky countenance, an apathetic or stupid expression, and contracted pupils. All the febrile symptoms already mentioned are fully developed, and delirium, usually of a low, muttering kind, but sometimes wild and maniacal (*delirium ferox*) is present both by night and day. The peculiar condition to which the term "coma vigil" is applied, in which the patient, though quite unconscious, lies with eyes widely open, is regarded, especially if persisting for any length of time, as an unfavorable omen. Throughout the second week of the attack the symptoms continue unabated; but there is in addition great prostration of strength, the pulse becoming very feeble, the breathing shallow and rapid, and often accompanied with bronchial sounds. (4) A *crisis* or favorable change takes place about the end of the second or beginning of the third week (on an average the 14th day), and is marked by a more or less abrupt fall of the temperature (*vide* chart) and of the pulse, together with slight perspiration, a discharge of loaded urine, the return of moisture to the tongue, and by a change in the patient's look, which clears up and shows signs of returning intelligence. Although the sense of weakness is extreme, convalescence is in general steady and comparatively rapid.

Typhus fever may, however, prove fatal during any stage of its progress and in the early convalescence, either from sudden failure of the heart's action—a condition which is specially apt to arise—from the supervention of some nervous symptoms, such as meningitis or of deepening coma, or from some other complication, such as bronchitis. Further, a fatal result sometimes takes place before the crisis from sheer exhaustion, particularly in the case of those whose physical or nervous energies have been lowered by hard work, inadequate nourishment and sleep, or intemperance, in all which conditions typhus fever is apt to assume an unusually serious form.

Occasionally troublesome sequelæ remain behind for a greater or less length of time as the effects of the fever. Among these may be mentioned mental weakness or irritability, occasionally some form of paralysis, an inflamed condition of the lymphatic vessels of one leg (the swelled leg of fever), prolonged weakness and ill health, etc. Gradual improvement, however, may be confidently anticipated and even ultimate recovery.

Mortality.

The mortality from typhus fever is estimated by Murchison and others as averaging about 18 per cent. of the cases, but it varies much according to the severity of type (particularly in epidemics), the previous health and habits of the individual, and very specially the age,—the proportion of deaths being in striking relation to the advance of life. Thus, while in children under fifteen the death rate is only 5 per cent., in persons over fifty it is about 46 per cent.

Treatment.

The treatment of typhus fever includes the prophylactic measures of attention to the sanitation of the more densely populated portions of towns. The opening up of cross streets intersecting those which are close-built and narrow, whereby fresh air is freely admitted, has done much to banish typhus fever from districts where previously it was endemic. Further, the enforcement of the law regulating the number of persons accommodated in common lodging-houses, and the application of the powers now vested in local authorities for dealing with cases of overcrowding everywhere, and for isolation and treat-

ment of the infected, have had a like salutary effect. Where typhus has broken out in a crowded district the prompt removal of the patients to a fever hospital and the thorough disinfection and cleansing of the infected houses are to be recommended. Where, on the other hand, a single case of accidentally caught typhus occurs in a member of a family inhabiting a well-aired house, the chance of it being communicated to others in the dwelling is but small; nevertheless every precaution in the way of isolation and disinfection should be taken.

The treatment of a typhus patient is conducted upon the same general principles as have been illustrated in other fevers (see SCARLET FEVER, SMALLPOX). Complete isolation should be maintained throughout the illness, and the services of a day and a night nurse procured, who should keep a strict watch and preserve a record of the temperature and other observations, the times of feeding and the form of nourishment administered, as well as every other fact noticed, for the physician's information. Due attention should be given to the ventilation and cleansing of the sick chamber. The main element in the treatment of this fever is good nursing, and especially the regular administration of nutriment, of which the best form is milk, although light plain soup may also be given. The food should be administered at stated intervals, not, as a rule, oftener than once in one and a half or two hours, and it will frequently be necessary to rouse the patient from his stupor for this purpose. Sometimes it is impossible to administer food by the mouth, in which case recourse must be had to nutrient enemata. Alcoholic stimulants are not often required, except in the case of elderly and weakly persons who have become greatly exhausted by the attack and are threatening to collapse. The best indication for their use is that furnished by the condition of the circulation: when the pulse shows unsteadiness and undue rapidity, and the first sound of the heart is but indistinctly heard by the stethoscope, the prompt administration of stimulants (of which the best form is pure spirit) will often succeed in averting danger. Should their use appear to increase the restlessness or delirium they should be discontinued and the diffusible (ammoniacal or ethereal) forms tried instead.

Many other symptoms demand special treatment. The headache, which persists for days at the commencement and is with many a very distressing symptom, may be mitigated by removing the hair and applying cold to the head. The sleeplessness, with or without delirium, may be combated by quietness, by a moderately darkened room (although a distinction between day and night should be made as regards the amount of admitted light), and by soothing and gentle dealing on the part of the nurse. Opiate and sedative medicines in any form, although recommended by many high authorities, must be given with great caution, as their use is often attended with danger in this fever, where coma is apt to supervene. When resorted to, probably the safest form is a combination of the bromide of potassium or ammonium with a guarded amount of chloral. The writer has seen alarming effects follow the administration of opium. Occasionally the deep stupor calls for remedies to rouse the patient, and these may be employed in the form of mustard or cantharides to the surface (calves of legs, nape of neck, over region of heart, etc.), of the cold affusion, or of enemata containing turpentine. The height of the temperature may be a serious symptom, and antipyretic remedies appear to have but a slight influence over it as compared to that which they possess in typhoid fever, acute rheumatism, etc. The cold bath treatment, which has been recommended, cannot be carried out without serious risk to life in the necessary movement of the patient. It is a well-recognized rule that persons suffering from typhus fever ought not to be moved up in bed for any purpose after the first few days. Cold sponging of the hands and feet and exposed parts, or cold to the head, may often considerably lower the temperature. Throughout the whole progress of a case the condition of the bladder requires special attention, owing to the patient's drowsiness, and the regular use of the catheter becomes, as a rule, necessary with the advance of the symptoms.

The complications and results of this fever fall to be dealt with according to the methods of treatment applicable to their character and extent.

TYPHOID OR ENTERIC FEVER.

Typhoid or enteric fever (ἔντερον, the intestine) is a continued fever characterized mainly by its insidious onset, by a peculiar course of the temperature, by marked abdominal symptoms occurring in connection with a specific lesion of the bowels, by an eruption upon the skin, by its uncertain duration, and by a liability to relapses.

This fever has received various names, such as gastric fever, abdominal typhus, infantile remittent fever, slow fever, nervous fever, etc. Dr. Murchison, in reference to its supposed origin in putridity, uses the term "pythogenic fever," but this designation has not been generally adopted. Up till a comparatively recent period typhoid was not distinguished from typhus fever. For, although it had been noticed that the course of the disease and its morbid anatomy were different from those of ordinary cases of typhus, it was believed that they merely represented a variety of that malady. The distinction between the two diseases appears to have been first accurately made in 1836 by Doctors Gerhard and Pennock of Philadelphia, and still more fully demonstrated by Dr. A. P. Stewart of Glasgow (afterwards of London). Subsequently all doubt upon the subject was removed by the careful clinical and pathological observations made by Sir William Jenner at the London fever hospital (1849–51). A clear distinction has been established between the two fevers, not only as regards their phenomena or morbid features, but equally as regards their origin. While typhus fever is a disease of overcrowding and poverty, typhoid may occur where such conditions are entirely excluded; and the connection of this malady with specific emanations given off from decomposing organic or feculent matters, or with contamination of food or water by the products of the disease, is now almost universally admitted. Alike in sporadic cases and in extensive epidemic outbreaks the existence of insanitary conditions in house drainage, water supply, etc., can in the majority of instances be made out. The question whether such conditions alone will suffice to beget this fever—or, in other words, its *de novo* origin—has, as in the case of typhus, been much discussed, and an affirmative opinion expressed by some high authorities. But the same remark must again be made as to the difficulties in the way of maintaining such a position in view of the evidence of the part played by microbes in infective processes.

Nature of typhoid.

That all insanitary conditions in respect of drainage of houses and localities furnish the most ready means for the introduction of the contagion of typhoid there is a general agreement, as there is equally that the most certain means of preventing its appearance or spread are those which provide a thoroughly trustworthy and secure drainage, a safe method of disposal of sewage, and a pure and abundant water supply. Typhoid fever is much less directly communicable from the sick to the healthy than typhus. The infective agent appears to reside in the discharges from the bowels, in which, particularly when exposed and undergoing decomposition, the contagium seems to multiply and to acquire increased potency. Thus in sewers, drains, etc., in association with putrefying matter, it may increase indefinitely, and by the emanations given off from such decomposing material accidentally escaping into houses, or by the contamination of drinking water in places where wells or cisterns are exposed to fecal or sewage pollution, the contagion is conveyed. Of the precise nature of the contagious principle we have as yet no full information,[1] but there appears to be strong reason for believing that a specific microbe or organism plays a part in the propagation of the disease. Still it is obvious that for its successful implantation in and effect upon the system a peculiar condition of preparedness or receptivity to the morbific agent must be presupposed to exist in the individual, regarding which also our knowledge is of the vaguest. There is abundant evidence that one of the vehicles for the conveyance of the contagion is food, especially milk, which may readily be-

Causes of its outbreak.

[1] A bacillus frequently noticed in certain tissues in cases of typhoid fever has not yet been satisfactorily proved to be an organism characteristic of that disease, nor even to be constantly present.

come contaminated with the products of the disease where an outbreak of the fever has occurred in a dairy.

Typhoid fever is most common among the young, the majority of the cases occurring between the ages of fifteen and twenty-five (Murchison). But children of any age may suffer, as may also, though more rarely, persons at or beyond middle life. It is of as frequent occurrence among the well-to-do as among the poor. The greater number of cases appear to occur in autumn. In all countries this fever seems liable to prevail; and, while some of its features may be modified by climate and locality, its main characters and its results are essentially the same everywhere.

The more important phenomena of typhoid fever will be better understood by a brief reference to the principal pathological changes which take place during the disease. These relate for the most part to the intestines, in which the morbid processes are highly characteristic, both as to their nature and their locality. The changes (to be presently specified) are evidently the result of the action of the contagium on the system, and they begin to show themselves from the very commencement of the fever, passing through various stages during its continuance. The portion of the bowels in which they occur most abundantly is the lower part of the small intestine (ileum), where the "solitary glands" and "Peyer's patches" on the mucous surface of the canal become affected by diseased action of a definite and progressive character, which stands in distinct relation to the symptoms exhibited by the patient in the course of the fever. (1) These glands, which in health are comparatively indistinct, become in the commencement of the fever enlarged and prominent by infiltration due to inflammatory action in their substance, and consequent cell proliferation. This change usually affects a large extent of the ileum, but is more marked in the lower portion near the ileo-cæcal valve (see ANATOMY). It is generally held that this is the condition of the parts during the first eight or ten days of the fever. (2) These enlarged glands next undergo a process of sloughing, the inflammatory products being cast off either in fragments or *en masse*. This usually takes place in the second week of the fever. (3) Ulcers are thus formed varying in size according to the gland masses which have sloughed away. They may be few or many in number, and they exhibit certain characteristic appearances. Thus they are frequently, but not always, oblong in shape, with their long axis in that of the bowel, and they have somewhat thin and ragged edges. They may extend through the thickness of the intestine to the peritoneal coat and in their progress erode bloodvessels or perforate the bowel. This stage of ulceration exists from the second week onwards during the remaining period of the fever, and even into the stage of convalescence. (4) In most instances these ulcers heal by cicatrization, leaving, however, no contraction of the calibre of the bowel. This stage of healing evidently occupies a considerable time, since the process does not advance at an equal rate in the case of all the ulcers, some of which have been later in forming than others. Even when convalescence has been apparently completed, some unhealed ulcers may yet remain and prove, particularly in connection with errors in diet, a cause of relapse of some of the symptoms, and even of still more serious or fatal consequences. The mesenteric glands external to, but in functional relation with, the intestine, become enlarged during the progress of the fever, but usually subside after recovery.

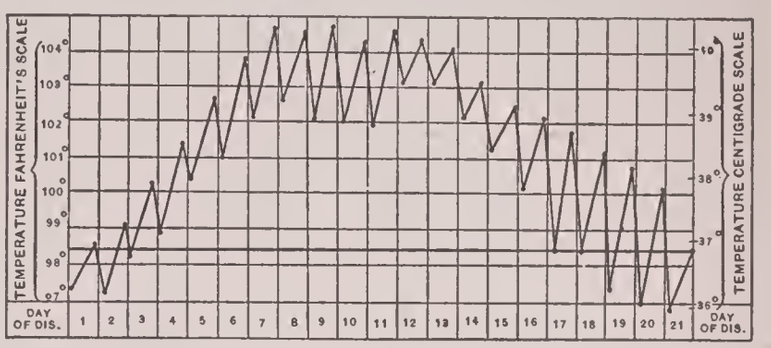
Pathological changes of typhoid.

Besides these changes, which are well recognized, others more or less important are often present. Among these may be mentioned one which the present writer has repeatedly observed in the severe and protracted forms of this fever, namely, marked atrophy, thinning, and softness of the coats of the intestines, even after the ulcers have healed,—a condition which may not improbably be the cause of that long-continued impairment of the function of the bowels so often complained of by persons who have passed through an attack of typhoid fever. Other changes common to most fevers are also to be observed, such as softening of the muscular tissues generally, and particularly of the heart, and evidences of complications affecting chest or other organs, which not unfrequently arise. The swelled leg of fever sometimes follows typhoid, as does also periosteal inflammation.

The symptoms characterizing the onset of typhoid fever are very much less marked than those of most other fevers, and the disease in the majority of instances sets in somewhat insidiously. Indeed, it is no uncommon thing for patients with this fever to go about for a considerable time after its action has begun.

Progress of the disease.

The most marked of the early symptoms are headache, lassitude, and discomfort, together with sleeplessness and feverishness, particularly at night; this last symptom is that by which the disease is most readily detected in its early stages. The peculiar course of the temperature is also one of the most important diagnostic evidences of this fever. During the first week it has a morning range of moderate febrile rise, but in the evening there is a marked ascent, with a fall again towards morning, each morning and evening, however, showing respectively a higher point than that of the previous day, until about the eighth day, when in an average case the highest point is attained. This varies according to the severity of the attack; but it is no unusual thing to register 104° or 105°



Temperature chart of typhoid fever.

Fahr. in the evening and 103° or 104° in the morning. During the second week the daily range of temperature is comparatively small, a slight morning remission being all that is observed. In the third week the same condition continues more or less; but frequently a slight tendency to lowering may be discerned, particularly in the morning temperature, and the febrile action gradually dies down as a rule between the twenty-first and twenty-eighth days, although it is liable to recur in the form of a relapse. Although the patient may, during the earlier days of the fever, be able to move about, he feels languid and uneasy; and usually before the first week is over he has to take to bed, and soon the effects of the attack become more apparent. He is restless, hot, and uncomfortable, particularly as the day advances, and his cheeks show a red flush, especially in the evening or after taking food. The aspect, however, is different from the oppressed stupid look which is present in typhus, and more resembles the appearance of hectic. The pulse in an ordinary case, although more rapid than normal, is not accelerated to an extent corresponding to the height of the temperature, and is, at least in the earlier stages of the fever, rarely above 100. In severe and protracted cases, where there is evidence of extensive intestinal ulceration, the pulse becomes rapid and weak, with a dicrotic character indicative of cardiac feebleness. The tongue has at first a thin whitish fur and is red at the tip and edges. It tends, however, to become dry, brown or glazed looking, and fissured transversely, while sordes may be present about the lips and teeth. There is much thirst and in some cases vomiting. Splenic and hepatic enlargement may be made out. From an early period in the disease abdominal symptoms show themselves with greater or less distinctness and are frequently of highly diagnostic significance. The abdomen is somewhat distended or tumid, and pain accompanying some gurgling sounds may be elicited on light pressure about the lower part of the right side close to the groin,—the region corresponding to that portion of the intestine in which the morbid changes already referred to are progressing. Diarrhœa is a frequent but by no means constant symptom. When present it may be slight in amount, or, on the other hand, extremely profuse, and it corresponds as a rule to the severity of the intestinal ulceration. The discharges are highly characteristic, being of light yellow color resembling pea soup in appearance. Should intestinal hæmorrhage occur, as is not unfrequently the case during some stage of the fever, they may be dark brown, or composed entirely of blood. The urine is scanty and high-colored. About the beginning, or during the course of the second week of the fever, an eruption frequently makes its appearance on the skin. It consists of isolated spots, oval or round in shape, of a pale pink or rose color, and of about one to one and a half lines in diameter. They are seen chiefly upon the abdomen, chest, and back, and they come out in crops, which continue for four or five days and then fade away. At first they are slightly elevated, and disappear on pressure. In some cases they are very few in number, and their presence is made out with difficulty; but in others they are numerous and sometimes show themselves upon the limbs as well as upon the body.

They do not appear to have any relation to the severity of the attack, and in a very considerable proportion of cases (particularly in children) they are entirely absent. Besides this eruption there are not unfrequently numerous very faint bluish patches or blotches about half an inch in diameter, chiefly upon the body and thighs. When present the rose-colored spots continue to come out in crops till nearly the end of the fever, and they may reappear should a relapse subsequently occur. These various symptoms persist throughout the third week, usually, however, increasing in intensity. The patient becomes prostrate and emaciated; the tongue is dry and brown, the pulse quickened and feeble, and the abdominal symptoms more marked; while nervous disturbance is exhibited in delirium, in tremors and jerkings of the muscles (*subsultus tendinum*), in drowsiness, and occasionally in "coma vigil." In severe cases the exhaustion reaches an extreme degree, although even in such instances the condition is not to be regarded as hopeless. In favorable cases a change for the better may be anticipated between the twenty-first and twenty-eighth days, more usually the latter. It does not, however, take place as in typhus by a well-marked crisis, but rather by what is termed a "lysis" or gradual subsidence of the febrile symptoms, especially noticeable in the daily decline of both morning and evening temperature, the lessening of diarrhœa, and improvement in pulse, tongue, etc. Convalescence proceeds slowly and is apt to be interrupted by relapses (due not unfrequently to errors in diet), which are sometimes as severe and prolonged as the original attack, and are attended with equal or even greater risks. Should such relapses repeat themselves, the case may be protracted for two or three months, but this is comparatively rare.

Causes of death in typhoid.

Death in typhoid fever usually takes place from one or other of the following causes. (1) Exhaustion, in the second or third weeks, or later. The attending symptoms are increasing emaciation, weakness of the pulse, and cadaveric aspect. Sometimes sinking is sudden, partaking of some of the characters of a collapse. (2) Hæmorrhage from the intestines. The evidence of this is exhibited, not only in the evacuations, but in the sudden fall of temperature and rise in pulse-rate, together with great pallor, faintness, and rapid sinking. Sometimes hæmorrhage, to a dangerous and even fatal extent, takes place from the nose. (3) Perforation of an intestinal ulcer. This gives rise, as a rule, to sudden and intense abdominal pain, together with vomiting and signs of collapse, viz., a rapid flickering pulse, cold clammy skin, and the marked fall of temperature. Symptoms of peritonitis (see PERITONITIS) quickly supervene and add to the patient's distress. Death usually takes place within 24 hours. Occasionally peritonitis, apart from perforation, is the cause of death. (4) Occasionally, but rarely, hyperpyrexia (excessive fever). (5) Complications, such as pulmonary or cerebral inflammation, bedsores, etc.

Certain sequelæ are sometimes observed, the most important being the swelled leg, periostitis affecting long bones, general ill-health, and anæmia, with digestive difficulties, often lasting for a long time, and sometimes issuing in phthisis. Occasionally, after severe cases, mental weakness is noticed, but it is usually of comparatively short duration.

Mortality.

The mortality in typhoid fever varies with the character of the outbreak, the general health and surroundings of the individuals attacked, and other conditions. At one time it was regarded as, on an average, about the same as that of typhus; but under modern methods of treatment the chances of recovery are much greater, and the death-rate may be stated as about 12 per cent. or perhaps somewhat less.

Treatment.

The treatment embraces those prophylactic measures which aim at preventing the escape of sewer gases into dwelling-houses by careful attention to the drainage and plumber-work, and also secure an abundant supply of pure water for domestic use (see HYGIENE, SEWERAGE, and VENTILATION). When an outbreak of the fever occurs in a family, all such matters should be specially inquired into, and the sources of milk supply carefully scrutinized. The discharges from the bowels of the typhoid patient should be at once disinfected with carbolic acid or other similar agent, and the greatest care taken as to their disposal, with the view of obviating any risk of contamination of drinking-water, etc. The general management is conducted upon the same principles as are observed in the case of typhus, except that in typhoid fever very special care is necessary in regard to diet. Milk, the great value of which as a fever-food was first clearly set forth by Prof. Gairdner, is of eminent service in typhoid, but it must be administered with due regard to time and to the digestive powers of the patient. When given too frequently or in too great quantity it may, by its imperfect digestion, prove a source of irritation to the bowels. Even when given with every care it may fail to agree, as is proved by the presence of undigested curd in the evacuations. In such a case its admixture with lime water or with peptonizing agents may render its digestion less difficult, but sometimes its use must for a time be suspended. It is, however, rare that milk cannot be borne when carefully administered. Barley water or simple soups, such as chicken broth, beef-tea, etc., are occasionally useful either as substitutes for or adjuvants to milk. All through the fever the patient should be fed at regular periods—not, as a rule, oftener than once in one and a half or two hours—although in the intervals water or other fever-drink may be given from time to time. In convalescence the diet should still be largely milk and soft matters, such as custards, light puddings, meat jellies, boiled bread and milk, etc., but other solid foods, with the exception of fish, should be for a long time avoided. In changing the diet it is of importance to note its effect upon the temperature, which may sometimes be considerably disturbed from this cause, even after the apparent subsidence of all febrile action. Stimulants, although unnecessary in a large proportion of cases, are occasionally called for when there is great exhaustion, and in prolonged attacks. Their effect, however, should be carefully watched. They are usually best administered in the form of pure spirit.

The more prominent symptoms which mark the course of typhoid fever frequently call for special treatment. Thus, when the fever continues long, with little break in its course, the employment of remedies to control its action (antipyretics) may often be resorted to with benefit. Such drugs as quinine, salicin, salicylic acid, and salicylate of soda, kairin, antipyrin, antifebrin, etc. (in ten to thirty grain doses of one or other), may frequently break in upon the continuity of the fever, and by markedly lowering the temperature relieve for a time the body from a source of waste, and aid in tranquillizing the excited nervous system. The times for their administration are either one or two hours before the usual maximum temperature or during the period of remission. These remedies may, however, fail, or by inducing sickness or great prostration and depression of the circulation require to be discontinued. For a similar purpose the cold bath is recommended by many high authorities and is regularly employed in Germany. The method recommended by Liebermeister is this: "When the temperature rises above 104° Fahr., the patient should be placed in a bath of about 94°, which is gradually cooled down by the addition of cold water to 68° Fahr., and remain immersed for twenty or thirty minutes, the limbs being all the while gently rubbed. He should then be put back into bed." Another method is that of Dr. Brand of Stettin: "When the patient's temperature attains 102° Fahr. he should be placed in a tepid bath of 70° and allowed to remain till a sense of coldness or shivering is produced, which usually occurs in from five to twenty minutes." By such means no doubt the temperature can often be reduced 2° or 3° Fahr., but it is very apt to rise again and the bath must then be repeated. It is claimed by the advocates of this method of treatment that it has been successful in diminishing greatly the mortality of typhoid fever, but they hold at the same time that its success in large measure depends upon its employment from an early stage in the disease. British physicians are much divided upon the point, many high authorities agreeing in its marked utility, while others no less eminent regard it as fraught with danger from the frequent movement of the patient from bed, the shock to the system, and the risk of hæmorrhage, pneumonia, or other complications, and as a plan of treatment difficult of being carried out in ordinary practice. Although employed in some fever hospitals and with apparent success, it has not yet commended itself for general adoption. Other methods of applying cold, while probably less effectual than the bath, are much more available, as for example, the tepid or cold pack, the frequent sponging of portions of the body with cold water, or the application of icebags to the head. The present writer has resorted to these methods in many cases of typhoid fever, with the effect of markedly lowering a high temperature. When diarrhœa is excessive it may be restrained by such remedies as chalk, bismuth, Dover's powders, etc. Hæmorrhage is dealt with by preparations of ergot, or by acetate of lead, gallic acid, or other styptics. In the event of perforation of the bowel opium is the only means available to lessen the distress attending that fatal occurrence.

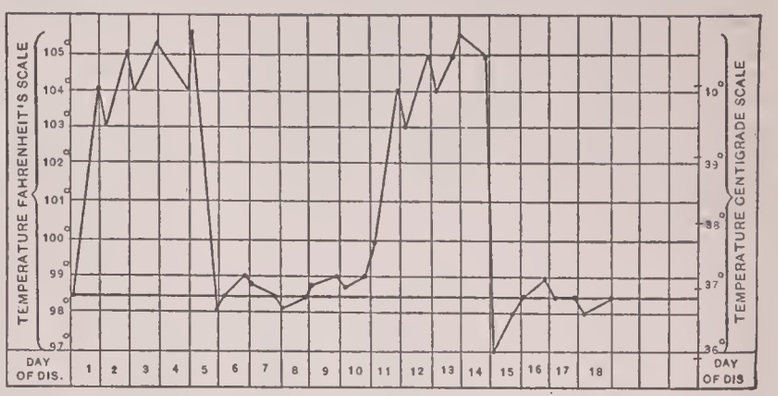
In the convalescent stage, and even after apparently complete recovery, the utmost care should be observed by the patient as to diet, all hard and indigestible substances being dangerous from their tendency to irritate or reopen unhealed ulcers, and bring on a relapse of the fever or cause a sudden perforation. Lastly the general health

demands careful attention for a length of time, in view of the remoter risks of chest and other diseases already alluded to.

Relapsing Fever.

This is a continued fever occasionally appearing as an epidemic in communities suffering from scarcity or famine. It is characterized mainly by its sudden invasion, with violent febrile symptoms, which continue for about a week and end in a crisis, but are followed, after another week, by a return of the fever.

This disease has received many other names, the best known of which are famine fever, short fever, synocha, bilious relapsing fever, recurrent typhus, and spirillum fever. As in the case of typhoid, relapsing fever was long believed to be simply a form of typhus. The distinction between them appears to have been first clearly established in 1826, in connection with an epidemic in Ireland. Outbreaks of relapsing fever have occurred in all parts of the world at times and in places where famine has arisen; but the disease has been most closely observed and studied in epidemics in Great Britain and Ireland, Germany, Poland, Russia, America, and India. It has frequently been found to prevail along with an epidemic of typhus fever.



Temperature chart of relapsing fever.

Causes of origination.

Relapsing fever is highly contagious, and appears, like typhus, to be readily communicated by the exhalations from the body. With respect to the nature of the contagion, certain important and interesting observations have been made. In 1873 Obermeier discovered in the blood of persons suffering from relapsing fever minute organisms in the form of spiral filaments of the genus *Spirochæte* (see vol. xxi. p. 416, Fig. 1, n), measuring in length $\frac{1}{500}$ to $\frac{1}{1500}$ inch and in breadth $\frac{1}{4000}$ to $\frac{1}{8000}$ inch, and possessed of rotatory or twisting movements. This organism has received the name of *Spirillum obermeieri*. It appears to be present in abundance during the height of the febrile symptoms, and is not seen during the interval until the relapse is impending, when it is again present as before. This observation has been confirmed by numerous investigators, and it has been found that inoculation with the blood containing these *Spirilla* produced the symptoms of relapsing fever in both men and animals. Comparatively little is as yet known of the life-history of these organisms, and the question whether they are to be regarded as the prime source of the disease or as mere accompaniments affords ground for difference of opinion (see Pathology, vol. xviii. p. 413); nevertheless their discovery and the conditions of their presence already mentioned are noteworthy facts in reference not only to the pathology of this fever but also to the general doctrine of infectiveness in disease-processes. The most constantly recognized factor in the origin and spread of relapsing fever is destitution; but this cannot be regarded as more than a predisposing cause favoring the reception and propagation of the morbific agent, since in many lands widespread and destructive famines have prevailed without any outbreak of this fever. Instances, too, have been recorded where epidemics were distinctly associated with overcrowding rather than with privation. Relapsing fever is most commonly met with in the young. One attack does not appear to protect from others, but rather, according to some authorities, engenders liability.

Its contagiousness.

The extreme contagiousness of relapsing fever has occasionally been shown by its spreading widely when introduced into a district, even among those who had not become predisposed by destitution or other depressing conditions. The contagion, like that of typhus, appears to be most active in the immediate vicinity of the patient and to be greatly lessened by the access of fresh air. It is capable of being conveyed by clothing. The incubation of the disease is about one week. The symptoms of the fever then show themselves with great abruptness and violence by a rigor, accompanied with pains in the limbs and severe headache. The febrile phenomena are very marked, and the temperature quickly rises to a high point (105°–107° Fahr.), at which it continues with little variation, while the pulse is rapid (100–140), full and strong. There is intense thirst, a dry brown tongue, bilious vomiting, tenderness over the liver and spleen, and occasionally jaundice. Sometimes a peculiar bronzy appearance of the skin is noticed, but there is no characteristic rash as in typhus. There is much prostration of strength. After the continuance of these symptoms for a period of from five to seven days, the temperature suddenly falls to the normal point or below it, the pulse becomes correspondingly slow, and a profuse perspiration occurs, while the severe headache disappears and the appetite returns. Except for a sense of weakness, the patient feels well and may even return to work, but in some cases there remains a condition of great debility, accompanied with rheumatic pains in the limbs. This state of freedom from fever continues for about a week, when there occurs a well-marked relapse with scarcely less abruptness and severity than in the first attack, and the whole symptoms are of the same character, but they do not, as a rule, continue so long, and they terminate in a crisis in three or four days, after which convalescence proceeds satisfactorily. Second, third, and even fourth relapses, however, may occur in exceptional cases.

Mortality, etc.

The mortality in relapsing fever is comparatively small, about 5 per cent. being the average death-rate in epidemics (Murchison). The fatal cases occur mostly from the complications common to continued fevers. The treatment is essentially the same as that for typhus fever (see above). (J. O. A.)

TYPOGRAPHY.

Part I.—Historical.

TYPOGRAPHY (writing by types) is the art of printing (cast-metal) movable types on paper, vellum, etc. It is quite distinct, not only from writing, but from xylography or wood-engraving, *i.e.*, the art of cutting figures, letters, or words on blocks of wood and taking impressions from such blocks, by means of ink or any other fluid colored substance, on paper or vellum.

Earliest definitions.

Possibly the earliest attempt to describe the art of typography is that in the *Donatus* issued by Peter Schoeffer, perhaps before 1456, the colophon of which says that it was finished "Arte nova imprimendi seu caracterizandi [from *character* = letter] . . . absque calami exaratione." Fust and Schoeffer in the Mainz psalter of 1457 said that it was formed by an "adinventio artificiosa imprimendi ac caracterizandi absque calami ulla exaratione." The colophon of the *Catholicon* of 1460 is more precise, and says that the book was printed "non calami, stili, aut pennæ suffragio, sed mira patronarum formarumque concordia, proporcione, et modulo." In 1462 Albrecht Pfister had "gedrucket" the *Four Histories*. In the *Liber Sextus Decretalium*, published in 1465, Fust and Schoeffer say that it was completed "non atramento ["atramento communi," in the Justinianus of 1468 and 1472], plumali canna neque ærea, sed artificiosa quadam adinventione imprimendi seu caracterizandi," a phrase which they slightly varied in Cicero's *De Officiis*, issued in the same year: "non atramento, plumali canna neque ærea, sed arte quadam perpulcra." The edition of St. Jerome's *Epistles* of 1470 is said to have been completed by an "ars impressoria," the *Decretum Gratiani* of 1472 by an "ars quædam

ingeniosa imprimendi," the *Dyalogus* of 1478 by an "ars magistra." We find further—"ars sancta" or "divina," "nova ars scribendi," "novum exscribendi genus prope divinum," "sculptoria archetyporum ars," "ars mirifica formandi," "ars excusoria," "nova imprimendi ratio," "ars pressuræ," "chalcotypa ars," "chaleographia" (1472 and later), "chaleographia excusoria impressoriaque," "libraria impressio," "empryntynge" (Caxton, 1482), "prenterei" (Schoeffer, 1492), "truckery" (1505), "impression des livres" (1498), and "prenten."

Printers.

The early printers called themselves, or were called by others, "librorum prothocaragmatici" (*Gramm. Rhythm.*, 1468), "impressores librorum," "exsculptor librorum" (Jenson, 1471), "chalcographus" (1473; Hain, 13,036), "magister artis impressoriæ," "boeckprinter;" and during the 16th century we find them still frequently called "chalcotypus" and "chalcographus."

Types.

The types were at first designated more by negative than positive expressions. In 1468 they were called "caragma," later on "caracter" or "eharaeter," "archetipæ notæ" (1473; Hain, 13,036), "sculptoria archetyporum ars," "chalcotypa ars," "formæ," "artificiosissimæ imprimendorum librorum formæ." We soon hear also of the proeess and material by which they were produced. The *Grammatica* of 1468, published by Schoeffer, says that it was "east" (sum fusus libellus). In 1471 "æneæ formulæ" are spoken of; and Bernardus Cenninus and his son say that they had printed the Virgil "expressis ante calibe earaeteribus et deinde fusis literis" (with letters first cut into steel and then cast). In 1473 Friedrich Creusner at Nuremberg says that he had "cut" (sculpsit) the work of Diogenes (Hain, 6192). Johan Zeiuer of Ulm says in 1474 that he had perfected a book, not with the pen, but with letters of metal (stagneis caracteribus). In 1474 Joh. Ph. de Lignamine speaks of "metallicæ formæ." In 1476 Husner of Strasburg represents the Nider as being printed with "letters eut of metal (litteris sculptis artificiali eerte conatu ex ære)." Nicolas Jenson printed in 1480 with letters "cut and east" (sculptis ac conflatis).

Word "typography."

The word *typographus* does not seem to occur before 1488, when it was used in the prefaee of P. Stephanus Duleinius Sealæ to the *Astronomicon* of Manilius, printed in that year at Milan by Antonius Zarotus;[1] in 1498 Erasmus uses it in a letter (dated 13th Feb.) to Christianus, a Lübeek merchant;[2] and in 1517 Johan Schoeffer applies the word to himself in the colophon of the Æneas Sylvius published by him. But of the use of the word *typographia* no earlier instaнce is known than 1520, in which year Gerardus Noviomagus (= Geldenhaurius) in his *Lucubratiuncula de Batavorum Insula* (pref. to Nicol. Buscoducensis, dated 1520) says: "inventa Germanorum . . . bombarda videlicet, typographia, pyxis chartaque nautica;" and Johan Schott, a printer of Strasburg, in the *Geogr. Ptolem.* published by him, deseribes his grandfather, Johan Mentelin, as "primus typographiæ inventor." Gerardus, it may be added, borrowed the whole passage from Pet. Montanus (li. 1 *Adag.*, published *a.* 1504), who has chalcographia instead of typographia. Meerman indeed[3] speaks of a use of the word typographia (or at least of typographus) earlier than 1520, and refers to the preface of Bernardinus Veronensis in the edition of Tibullus, Catullus, and Propertius published at Venice in 1493 by Symon Bevilaqua, "at least," Meerman adds, "as it (the prefaee) is read in the *Annal. Typogr.* of Maittaire, i. 560, 2d ed." But on page 560 Maittaire quotes the first two lines of Bernardinus's preface (till *dicit*) and then adds: "Græcis eharacteribus destitutus, typographus neeesse habuit hiatus in commentario hic illic relinquere," which is evidently Maittaire's own remark, not that of Bernardinus. The present writer at least has beeu unable to find suеh a passage in the Tibullus.

Although the art of writing and that of block-printing both differ widely from printing with movable metal types, yet this last process seems to have been such a gradual transition from block-printing, and block-printing in its turn to have been such a natural outeome of the many trials that were probably made to produce books in some more expeditious manner than could be done with handwriting, that a cursory glance at these two processes will not seem out of place, all the less as a disenssion on the origin and progress of typography could hardly be understood without knowing the state of the literary development at the time that printing appeared.

First attempts at printing.

The art of printing, *i.e.*, of impressing (by means of certain forms and colors) figures, pictures, letters, words, lines, whole pages, etc., on other objects, as also the art of engraving, which is inseparably connected with printing, existed long before the 15th century. Not to go back to remoter essays, there is reason to suppose that mediæval kings and princes (among others William the Conqueror) had their monograms cut on blocks of wood or metal in order to impress them on their charters. Such impressions from stamps are found instead of seals on charters of the 15th century. Manuscripts of the 12th century show initials which, on account of their uniformity, are believed to have been impressed by means of stamps or dies.[4] But the idea of multiplying representations from one engraved plate or block or other form was unknown to the ancients, whereas it is predominant in what we call the art of block-printing, and especially in that of typography, in which the same types can be used again and again.

East Asiatic Printing.

Block printing and printing with movable types seem to have been practiced in China and Japan long before they were known in Europe. It is said that in the year 175 the text of the Chinese classics was eut upon tablets, which were erected outside the university, and that impressions were taken of them, some of which are said to be still in existence. Printing from wooden blocks can be traced as far back as the 6th century, when the founder of the Suy dynasty is said to have had the remains of the classical books engraved on wood, though it was not until the 10th century that printed books became common. In Japan the earliest example of block-printing dates from the period 764–770, when the empress Shiyau-toku, in pursuance of a vow, had a million small wooden toy pagodas made for distribution among the Buddhist temples and monasteries, each of which was to contain a dhâranî out of the Buddhist Scriptures entitled "Vimala nirbhasa Sûtra," printed on a slip of paper about 18 inches in length and 2 in width, which was rolled up and deposited in the body of the pagoda under the spire. In a journal of the period, under the year 987, the expression "printed book" (*suri-hoñ*) is found applied to a copy of the Buddhist canon brought back from China by a Buddhist priest. This, of course, must have been a Chinese edition; but the use of the term implies that printed books were already known in Japan. It is said that the Chinese printed with movable types (of clay) from the middle of the 11th century. The authorities of the British Museum exhibit as the earliest instance of Corean books printed with movable types a work printed in 1337. To the Coreans is attributed the invention of copper types in the beginning of the 15th century; and an inspection of books bearing dates of that period seems to show that they used such types, even if they did not invent them.[5]

From such evidence as we have it would seem that Europe is not indebted to the Chinese or Japanese for the art of block-printing, nor for that of printing with movable types.

MS. period.

In Europe, as late as the second half of the 14th century, every book (including school and prayer books), and every public and private document, proclamation, bull, letter, etc., was written by hand; all figures and pictures, even playing-cards and images of saints, were drawn with the pen or painted with a brush. In the 13th century there already existed a kind of book trade. The organization of universities as well as that of large ecclesiastical establishments was at that time incomplete, especially in Italy, France, and Germany, without a staff of scribes and transcribers (*scriptores*), illuminators, lenders, sellers, and custodians of books (*stationarii librorum*, *librarii*), and *pergamenarii*, *i.e.*, persons who prepared and sold the vellum or parchment required for books and documents. The books supplied were for the most part legal, theological, and educa-

[4] Passavant, *Le Peintre-Graveur*, i. 18, Leipsic, 1860–64; John Jackson, *Wood-Engraving*, London, 1839; Bucher, *Gesch. der techn. Künste*, p. 362 *sq.*
[5] See Ern. Satow, "On the Early Hist. of Printing in Japan," in *Trans. Asiat. Soc. of Japan*, x. 48 *sq.*; and Stan. Julien, "Documents sur l'Art d'Imprimer," etc., in *Journ. Asiat.*, 4me ser., ix. 505.

tional, and are calculated to have amounted to above one hundred different works. As no book or document was approved unless it had some ornamented and illuminated initials or capital letters, there was no want of illuminators. The workmen scribes and transcribers were, perhaps without exception, caligraphers, and the illuminators for the most part artists. Beautifully written and richly illuminated manuscripts on vellum became objects of luxury which were eagerly bought and treasured up by princes and people of distinction. Burgundy of the 15th century, with its rich literature, its wealthy towns, its love for art, and its school of painting, was in this respect the centre of Europe, and the libraries of its dukes at Brussels, Bruges, Antwerp, Ghent, etc., contained more than three thousand beautifully illuminated MSS.

Classes of writing.

In speaking of the writing of the manuscripts of the 15th and two preceding centuries, it is essential to distinguish, in each country, between at least four different classes of writing, and two of these must be again subdivided each into two classes. All these different kinds of writing were, in the first instance, taken as models for cutting such portions of text as were intended to illustrate and explain the figures in block-books, and afterwards as models for the types used in the printing of books and documents.

(1) The *book hand*, that is, the ordinary writiug of legal, theological, and devotional books, was used by the official trauscribers of the uuiversities and churches. These men had received a more or less learned education, and couse-quently wrote or transcribed books with a certain pretence of understanding them and of being able to write with greater rapidity than the ordinary caligrapher. Hence their writiug may be called (*a*) the *current* or *cursive book hand*, of which a good many illustrations may be found in Wilh. Schum, *Exempla Codicum Amplon, Erfurtensium*. Quite distinct from this current writiug, and much clearer and more distinct, is (*b*) the *upright* or *set book hand*, which was employed by some writers who worked for universities and churches, and also by a good many who may be presumed to have worked in large cities and commercial towns for schools and the people in general without university connection. (2) In the *church hand* (Gothic or black letter) were produced transcripts of the Bible, missals, psalters, and other works intended for use in churches and private places of worship. This writing we may again subdivide into two classes,—(*a*) the *ornamental* or *caligraphic* writing, found exclusively in books intended for use in churches or for the private use of wealthy and distinguished persons, aud (*b*) the ordinary *upright* or *set church hand*, employed for less ornamental and less expensive books. (3) The *letter hand* may be said to be intermediate between the set literary book hand and the set literary church haud, and to differ but little from either. It was employed in all public documents of the nature of a letter. (4) The *court* or *charter hand* was used for charters, title-deeds, papal bulls, etc.

15th-century books written.

Dypold Läber (Lauber), a teacher and transcriber at Hagenau iu Germany, is known to have carried on a busy trade in manuscripts just about the time of the invention of printiug. His prospectuses, in handwriting of about the middle of the 15th century, announce that whatever books people wish to have, large or small, "geistlich oder weltlich, hübsch gemolt," are all to be found at Dypold Lauber's the scribe. He had in stock *Gesta Romanorum, mit den Viguren gemolt;* poetical works (*Parcival, Tristan, Freidank*); romances of chivalry (*Der Witfarn Ritter; Von eime Getruwen Ritter der siu eigen Hertze gab umb einer schönen Frowen willen; Der Ritter unter dem Zuber*); Biblical and legendary works (*A Rimed Bible; A Psalter, Latin and German; Episteln und Evangelien durch das Jor; Vita Christy; Das gantze Passional, winterteil und summerteil*); devotional books (*Bellial; Der Selen Trost; Der Rosenkrantz; Die zehn Gebot mit Glosen; Small Bette-Bücher*); and books for the people (*Gute bewehrte Artznien-Bücher; Gemolte Loss-Bücher, i.e.*, fortune-telling books; *Schachtzabel gemolt*). The lower educational books consisted for the most part of the *Abecedaria*, containing the alphabet, the Lord's prayer, the creed, and one or two prayers; the *Donatus*, a short Latin grammar extracted from the work of Ælius Donatus, a Roman grammarian of the 4th century, and distinctly mentioued in a school ordinance of Bautzen of 1418; the *Doctrinale*, a Latin grammar in leonine verse, compiled by Alexander Gallus (or De Villa Dei), a minorite of Brittany of the 13th century; the *Summula Logica* of Petrus Hispanus (afterwards Pope John XXI.), used in the teachiug of logic and dialectics; and Dionysius Cato's *Disticha de Moribus*, and its supplement called *Facetus*, with the *Floretus* of St. Bernard, used in the teaching of morals. As helps to the clergy in their attempts to educate the lower classes, and as a means of assisting and promoting private devotion, there were picture books accompanied with an easy explanatory text, for the most part representations of the mystic relation between the Old and New Testaments (typology). Among these books the *Biblia Pauperum*[1] stands first. It represents pictorially the life and passiou of Christ, and there exist MSS. of it as early as the 13th century, in some cases beautifully illuminated.[2] A richly illuminated MS. of it, executed in the Netherlands *c.* 1400, is in the British museum (press-mark, King's, 5), and also fragments of one of the 14th century (press-mark, 31,303). A remodelling aud development of this work is the *Speculum Humanæ Salvationis*, a work in rhyme of the 14th century, which in forty-five chapters represents the Bible history interwoven with Mariolatry and legend. Of this work the Paris national library and arseual library each possesses a MS. composed in 1324, whereas the British Museum has nine MSS. (six being illuminated) of the 14th and 15th centuries, written in the Netherlands, Germany, France, aud Eugland, one (press-mark, 16,578) bcariug the distinct date 1379 and another (press-mark, Egerton, 878) that of 1436. A work of a similar nature is the *Apocalypsis*, of which at least two recensious with illustrations may be pointed out. One gives the text as we know it, with or without commentary, for which *cf.* Brit. Mus., 17,333 (French), 18,633 (French, but written in England), Reg. 2 D. xiii., and 22,493 (French),—all four early 14th century. Another is more a short history or biography of St. John, but the illustrations follow those of the former work very closely; *cf.* Brit. Mus., 19,896 (15th century, German). It is this last recension which agrees with the block-book to be mentioned hereafter. Other devotional works are the *Ars Moriendi*, the *Antichrist*, and other works which will be found mentioned among the block-books.

Block-Printing or Xylography.

Block printing.

When all this writing, transcribing, illuminating, etc., had reached their period of greatest development, the art of printing from wooden blocks (block-printing, xylography) on silk, cloth, etc., vellum, and paper made its appearance in Europe. It seems to have been practiced, so far as we have evidence, on cloth, etc., and vellum as early as the 12th century,[3] and on paper as far back as the second half of the 14th century, while it was largely employed in the early part of the 15th in the production of (1) separate leaves (called *briefs*, from *breve*, scriptum), containing either a picture (*print, prent*, shortened from the Fr. *emprint, empreinte*, and already used by Chaucer, *C. T.*, 6186, sixtext, D. 604, *printe, prente, preente*, and in other early English documents; also called in colloquial German *Helge, Helglein*, or *Halge*) or a piece of text, or both together; and of (2) whole block-books, sometimes consisting of half picture and half text, or wholly of text, or altogether of picture.[4] It is, however, certain that about 1400 xylography was known all over Germany, Flanders, and Holland.

In these blocks, as in wood-engraving now, the lines to be printed were in relief. The block, after the picture or the text had been engraved upon it, was first thoroughly wetted with a thin, watery, pale browu material, much resembling distemper; theu a sheet of damp paper was laid upon it, aud the back of the paper was carefully rubbed with some kind of dabber or burnisher, usually called a *frotton*, till an impression from the ridges of the carved block had been transferred to the paper. In this fashion a sheet could only be printed on one side (anopisthographic); and in some copies of block-books we find the sides on which there is no printiug pasted together so as to give the work the appearance of an ordinary book. There are only a few block-books which do not possess this characteristic, as the

[1] We find this title applied to at least three works,—(1) the well-known block-book, of which we speak below, (2) a treatise "in qua de vitiis et virtutibus agitur," and (3) a work in rhyme by Alexander Gallus.

[2] See Laib and Schwarz, *Biblia Pauperum*, Zurich, 1867.

[3] Weigel, *Anfänge*, i. 10.

[4] We have also evidence that sometimes the picture or figures were printed from blocks, space being reserved for the text, to be added afterwards by hand (see Bernard, *Origine*, i. 102).

Legend of St. Servatius in the royal library of Brussels, *Das Zeitglöcklein* in the Bamberg library (*cf.* Falkenstein, p. 49), *Das geistlich und weltlich Rom* at Althorp and Gotha (*cf.* Falkenstein, p. 46); but these belong to the end of the 15th century, and therefore to a later period than the ordinary block-books. Consequently, if a man wanted to set up as a printer of briefs or books, he needed no apparatus but a set of wood-blocks and a rubber.

Formerly it was the general opinion that playing-cards had been the first products of xylography; but the earliest that have been preserved to us are done by hand, while the printed ones date from the 15th century, therefore from a period in which woodcuts were already used for other purposes. It is believed that some of the wood engravings and block-books were printed in monasteries. In a necrology of the Franciscan monastery at Nördlingen, which comes down to the beginning of the 15th century, this entry occurs: "VII. Id. Augusti, obiit Frater h. Luger, laycus, optimus incisor lignorum;" and on some of the engravings we find the arms of certain monasteries, which may, however, merely mean that they were printed for, not in, those monasteries. The registers of Ulm mention several wood-engravers (*formschneider*),—in 1398 a certain Ulrich; in 1441 Heinrich Peter von Erolzheim, Joerg, and another Heinrich; in 1442 Ulrich and Lienhart; in 1447 Claus (Nicolas), Stoffel (Christopher), and Johann; in 1455 Wilhelm; in 1461 Meister Ulrich, etc. In a register of taxes of Nördlingen we find from 1423 to 1452 a certain Wilhelm Kegeler mentioned as *briefträcker;* in 1453 his widow is called *alt briefträckerin;* and in 1461 his brother Wilhelm is registered for the same craft. At Mainz there was a printer, Henne Cruse, in 1440. At Nuremberg we find in 1449 Hans, a *formschneider*, while his son Junghans exercised the same industry from 1472 to 1490. Hans von Pfedersheim printed at Frankfort in 1459, and Peter Schott at Strasburg in 1464. A certain George Glockendon exercised the same trade at Nuremberg till 1474, when he died, being succeeded by a son and afterwards by a grandson. In Flanders a Jan de Printere was established at Antwerp in 1417; and printers and wood engravers (*houte bildsnyters*) worked there in 1442 (*Privileges of the Corporation of St. Luke* at Antwerp). At Bruges *printers* and *beehlemakers* (makers, engravers of images) were enumerated in 1454 among the members of the fraternity of St. John the Evangelist. The printers of playing cards seem to have constituted a separate class. These entries show that about the middle of the 15th century there were men who exercised the art of wood-engraving and printing as a trade or craft. It seems also certain that wealthy persons and religious institutions were wont to possess sets of blocks, and, when occasion arose, they printed a set of sheets for presentation to a friend, or in the case of monasteries for sale to the passing pilgrim. A printer of briefs or block-books had no need to serve an apprenticeship; any neat-handed man could print for himself. We learn from the inventory of the possessions of Jean de Hinsberg, bishop of Liége (1419–1455), and his sister, a nun in the convent of Bethany, near Mechlin, that they possessed "unum instrumentum ad imprimendas scripturas et ymagines," and "novem printe lignee ad imprimendas ymagines cum quatuordecim aliis lapideis printis." These entries would seem to indicate that people purchased engraved blocks of wood or of stone from the woodcutter rather than books from a printer.

Block-printers.

The earliest dated woodcut that we know of is the St. Christopher of 1423, preserved in the library of Lord Spencer at Althorp. The Mary engraving, which is preserved at Brussels and apparently bears the date mccccxviii, is now declared to be of 1468, the date having been falsified. The next date after that of the St. Christopher is 1437, found on a woodcut preserved in the imperial library at Vienna. It was discovered in 1779 in the monastery of St. Blaise in the Black Forest, and represents the martyrdom of St. Sebastian, with fourteen lines of text. The date, however, is said by others to [illegible] to a concession of indulgences. A woodcut, preserved in the library at Vienna, which represents St. Nicolas de Tolentino, has the date 1440, but written in by hand; as the saint was canonized in that year, it may refer to that event. Another in the Weigel collection representing the bearing of the cross, St. Dorothea and St. Alexis, has the date 1443, also written in by hand, though the woodcut is considered to belong to that period. These are the only known wood-engravings with dates anterior to the second half of the 15th century. But there exist a good many woodcuts which, from the style of the engraving, are presumed to be of an earlier date, and to have been printed partly in the fourteenth and partly in the first half of the 15th century. J. D. Passavant[1] enumerates twenty-seven, all of German origin and preserved in various libraries in Germany, while in the *Collectio Weigeliana* (vol. i.) no fewer than 154 are recorded, some of which are to be ascribed to the Netherlands. We know of the existence of at least five engravings which may be ascribed to the Netherlands: (1) representing the Virgin Mary, with Dutch inscriptions, in the museum at Berlin; (2) representing the Virgin Mary spoken of above, in the library at Brussels; (3) representing St. Anthony and St. Sebastian, in the Weigel collection; (4) a St. Hubert and St. Eustatius, in the royal library at Brussels: (5) representing the Child Jesus, in the library at Berlin; (6) the Mass of St. Gregory, with indulgence, in the Weigel collection (*cf.* i. 195).

Early dated wood-engravings.

Of block-books of probable German origin the following are known:

(1) The *Apocalypsis*, or *Historia S. Johannis Evangelistæ ejusque Visiones Apocalypticæ* (Germ. *Das Buch der haymlichen Offenbarungen Sanct Johans*). Of this work six or seven editions are said to exist, each containing forty-eight (the 2d and 3d editions fifty) illustrations, on as many anopisthographic leaves, which seem to have been divided into three quires of eight sheets each. The first edition alone is without signatures.

Block-books of German origin.

(2) *Ars Moriendi.* Of this work some authors think that there are early German editions, among others that spoken of below as the 2d Dutch edition. Certainly German is the edition of Hans Sporer of Nuremberg, 1473, in the public library at Zwickau, of another by Ludwig zu Ulm, in the Paris national library, and of that described in *Collectio Weigel.* (ii. 16), where also other, but opisthographic, editions are described.

(3) *Ars Memorandi;* thirty leaves, folio, printed on one side, fifteen leaves being letter-press and fifteen plates.

(4) *Salve Regina*, bears the name of its engraver, Lienhart czu Regenspurck. It is composed of sixteen leaves: two leaves (signature *a*) are wantiug in the only copy kuown of it, which was in the Weigel collection (ii. 103).

(5) *Vita Christi;* thirty-two leaves, sm. 8vo. Two copies in the Paris library (Sotheby, ii. 143).

(6) *The Ten Commandments for Unlearned People* (*Die zehn Bott für die ungelernte Lent*). Ten leaves are preserved in the library at Heidelberg bound up with a manuscript (No. 438).[2]

(7) *The Passion of Our Lord;* sixteen leaves, in the Weigel collection (Sotheby, ii. 141).

(8) *The Antichrist* (*Der Enndchrist*); twenty-six leaves, small folio (Sotheby, ii. 38; Weigel, ii. 111). Copies, Lord Spencer and coll. Weig.

(9) *The Fifteen Signs of the Last Judgment;* twelve engravings, usually bound up with the engravings of *The Antichrist* (Sotheby, ii. 42). Copy, Lord Spencer. There is also an edition published at Nuremberg in 1472 by Junghanuss Priffmaler.

(10) *Symbolum Apostolicum;* small quarto, seven leaves printed on one side only, and containing twelve woodcuts with German inscriptions. The only copy of it known is preserved in the library of Munich (Sotheby, ii. 148).

(11) *The Legend of St. Meinrad;* forty-eight leaves. The only copy known is preserved in the Munich library (Sotheby, ii. 150).

(12) The *Acht Schalkheiten*, of which eight leaves were in the Weigel collection (i. 112; Sotheby, ii. 154).

(13) The *Fable of the Sick Lion;* twelve leaves. preserved in the library at Heidelberg (No. 438; see Sotheby, ii. 159, pl. lxxxvi.).

(14) *Defensorium Inviolatæ Virginitatis b. Mariæ Virginis;* sixteen leaves fol. The unique copy is in the British Museum. On the first leaf are the initials of the printer F[riedrich] W[altheren] and the date 1470 (Sotheby, ii. p. 63).

(15) The same work, twenty-seven leaves, large folio, with the imprint "Johannes eysenhüt impressor Anno ab incarnacõis dñice M° quadringentesimo septuagesimo j°" (*cf.* Sotheby, ii. 72). Copy in the British Museum.

(16) *The Dance of Death* (*Dance Macabre; Der Doten Dantz*); twenty-seven leaves (Sotheby, ii. 156).

(17) *Die Kunst Ciromantia* of Dr. Johan Hartlieb (Sotheby, ii. 84).

(18) *Der Beichtspiegel* or *Confessionale;* eight engravings (Sotheby, ii. 145). Copy in the royal library at The Hague.

(19) The Apostles' Creed; seven leaves, folio. Copy at Wolfenbüttel.

(20) The Credo, in German; twelve leaves, quarto. Copy in the royal library at Munich.

[1] *Le Peintre-Graveur*, i. 27 *sq.*

[2] See Joh. Geffcken, *Der Bildercatechismus des* 15 *Jahrh.*, Leipsic, 1855, quarto; Sotheby, ii. 160.

Propugnacula, seu Turris Sapientiæ; one sheet, plano, Brit. Mus. (Sotheby, ii. 164).

Of Netherlandish origin.

Block-books of Netherlandish origin are:

(1) *Biblia Pauperum;* forty leaves (each bearing a signature; *a* to *v*, 'a' to 'v'). As many as seven editions have been distinguished by Sotheby (i. 43; see also Holtrop, *Monum. Typ.*, p. 3).

(2) *Ars Moriendi*;[1] twenty-four leaves, small folio, thirteen containing text, eleven plates (see Sotheby, i. 69; Holtrop, p. 8).

(3) *Canticum Canticorum, Historia seu Providentia B. Virginis Mariæ ex Cantico Canticorum;* sixteen leaves, in fol. (Sotheby, i. 77; Holtrop, p. 6).

(4) *Liber Regum, seu Historia Davidis;* twenty leaves, folio (Sotheby, i. 120b). Some consider this to be a German work.

(5) *Exercitium super Pater Noster*, by Henricus de Pomerio; ten leaves, small folio (Sotheby, ii. 137; Holtrop, p. 10).[2]

(6) *Temptationes Demonis Temptantis Hominem de Septem Peccatis Mortalibus;* a single large folio leaf printed on one side. Two copies, one in British Museum, the other in the library at Wolfenbüttel.

(7) *Vita Christi*, or the *Life and Passion of Christ;* thirty-six cuts, originally printed in a press on six anopisthographic leaves, 8vo. In the library at Erlangen (see Campbell, *Annales*, 746).

(8) *Historia Sanctæ Crucis;* a fragment of one leaf (with signature *g*), preserved in the Weigel collection (ii. 92), which seems to be a proof-sheet only.

(9) *Alphabet* in figures (Holtrop, p. 11; Sotheby, i. 122).[3]

(10) *Pomerium Spirituale*, by Henricus de Pomerio or Henry Bogaert; twelve leaves, having twelve woodcuts accompanied by MS. text, in the library at Brussels (Holtrop, *Mon. Typ.*, p. 9). It bears the date 1440 in two places; but some contend that this refers to the date when the book was written,[4] not when the engravings were printed.

Besides the works of Sotheby, Holtrop, and Weigel, already quoted, consult W. M. Conway, *The Woodcutters of the Netherlands in the 15th Century*, Cambridge, 1884; Heineken, *Idée Générale*, Leipsic, 1771; J. Ph. Berjeau, *Facsimiles of the Biblia Pauperum, Canticum Canticorum, Speculum*, London, 1859–1861; and Id., *Catal. Illustré des Livres Xylogr.*, Loudou, 1865.

Early Printing at Mainz.

When we, for the moment, leave out of sight the question as to when, where, and by whom the art of printing with movable metal types was invented, and take our stand on well-authenticated dates in such printed documents as have been preserved to us, we find that the first printed date, 1454, occurs in two different editions of the same letters of indulgence issued in that year by Pope Nicholas V. in behalf of the kingdom of Cyprus.

Nicholas V.'s indulgence of 1454.

These two editions are distinguished respectively as the 31-line and the 30-line indulgence. The former, of which three different issues with the printed date mccccliiii., and a fourth with the printed date mcccclv., are known to exist, claims priority[5] from a chronological point of view over the latter, of which one issue with the printed date mccccliiii., and two issues with the printed date mcccclquinto, are known to exist, because one of the sold copies that has been preserved was issued at Erfurt on 15th November, 1454, whereas of the 30-line indulgence the earliest sold copy that has as yet come down to us was issued at Cologne on 27th February, 1455, though it distinctly has the printed date mccccliiii., but altered with the pen to mccccliiiij. In the 31-line indulgence occur (1) a large church type usually regarded as identical with that of the 36-line Bible, and used for the rubrics of the absolutions, for the word with which the document commences, and for the Christian name of the pope's legate; (2) a smaller text or brief type, which was afterwards very closely imitated, if not actually used, at Eltville, in printing the 1472 edition of the *Vocabularius ex quo* and an edition of the *Summa de Articulis Fidei* of Thomas Aquinas; (3) a large initial V and two large initials M, which differ from each other. In the 30-line indulgence occur (1) a large church type, which is used as in the 31-line indulgence, and is usually regarded as identical with that of the 42-line Bible; (2) a smaller text or brief type, of which as yet no further trace has been found; (3) a large initial U, and two large initials M, which differ from each other, the first being identical with the initial M of the second absolution of a 33-line indulgence printed by Peter Schoeffer in 1489 for "Raymundus Peyraudi, archidiaconus Alnisiensis in ecclesia Xanton," who issued it at the order of Pope Innocent VIII., "pro tuicione orthodoxe fidei contra Turchos." These two different editions are usually regarded as having been printed at Mainz; and, so long as there is no evidence to the contrary, we may assume that such was really the fact.

Mainz printing.

But we must at the same time conclude that about November, 1454, there were at least two rival printers at work there,—(1) the printer of the 31-line indulgence, whose name has not yet transpired, but who may have been Johan Gutenberg, perhaps subsidized by Johan Fust; (2) the printer of the 30-line indulgence, who was no doubt Peter (Schoeffer) de Gernssheym, on account of the connection of this indulgence with that of 1489, which was unquestionably printed by him. Latterly four written copies of the same indulgence have been found, which respectively bear the dates,—Frankfort, 10th April, 1454 (in the possession of Herr Lais, Wiesbaden); Frankfort, 11th April, 1454 (Frankfort archives); 11th July, 1454 (place unknown; Darmstadt archives); Lübeck, 6th October, 1454. As their dates precede by a few weeks only the earliest known printed date (15th November, 1454), they mark, perhaps, the exact time when printing made its appearance at Mainz in an already advanced state of perfection.

Early types and books at Mainz.

In following up the basis afforded by the above indulgences we may give a short chronological view of the early printing at Mainz, so far as it is at present known, referring for minute details to J. H. Hessels, *Gutenberg: Was he the Inventor of Printing?* 1882, p. 150 *sq.*

TYPES 1 (large church type) and 2 (smaller brief type), used by an unknown printer, 1454.

(i.) 31-line indulgence; three different issues (A, B, C), with the printed year mccccliiii., and one issue (D) with the printed year mcccclv. All printed on vellum. Of issues A and B no sold copies have yet come to light. Three unsold copies of each are preserved at (1) Brunswick, (2) Wolfenbüttel, and (3) Hanover (Culemann). Of issue C eight sold copies are known to exist in various libraries, with dates from Nov. 15, 1454, to Apr. 30, 1455. Also four unused copies have been discovered. Of issue D ten sold copies with dates from Mar. 7, 1455, to Apr. 30, 1455 and four unused copies are known.

TYPE 1, *continued;* for type 2 see below.

(ii.) *Manung widder die Durke.* An almanac for Jan., 1455, in 4to, 5 leaves, 20 and 21 uneven lines. The only copy known was discovered at Augsburg, and is now in the Munich library.

(iii.) *Conjunctiones et Oppositiones Solis et Lunæ.* A calendar for 1457, a broadside sheet, printed on one side. The upper half of the only copy known was discovered at Mainz, and is now in the Paris library.

(iv.) *Der Cisianus* (not Cislanus) *zu Dutsche.* A broadside sheet, printed on one side, 36 lines, besides separate head-line. The Tross copy, mentioned in Suppl. to Brunet's *Manuel* (1878, s.v. "Cislanus"), was bought in 1870 for the Cambridge university library.

(v.) and (vi.) *Donatus.* Two different editions of 14 (?) leaves each, 27 lines (B. Mus., C. 18. e 1, Nos. 2 and 5).

(vii.) *Donatus* of 30 lines, 12 (?) leaves; a fragment of the 8th (?) in the Mainz library.

(viii.) 36-line Bible. 2 vols. fol., 882 leaves, with 2 columns of 36 lines each on a page. Some bibliographers call this the Pfister Bible, assuming that Pfister printed it. The Paris library possesses a paper copy, and also a separate copy of the last leaf, which bears the MS. date 1461. Other copies exist in Lord Spencer's library, in the Brit. Mus., at Jena, Leipsic, Antwerp, etc.[6]

TYPES 3 (large church type) and 4 (smaller brief type), used by Peter Schoeffer de Gernssheym, 1454–1455.

(i.) 30-line indulgence; one issue (A) with the printed year mccccliiii., and two issues (B, C) with the printed year mcccclquinto. All printed on vellum. Of issue A only one copy has been discovered, now in Lord Spencer's library. It was sold at Cologne on Feb. 27, 1455, the printed date mccccliiii. having been altered with the pen to mccccliiiij. Of issue B two sold copies, with dates Apr. 11 and 29, 1455, are in the Berlin library and the Brit. Mus. Of issue C two sold copies, with dates Feb. 22 and Apr. 24, 1455, are at Hanover (Culemann) and Wolfenbüttel. An unsold copy is at Hanover (Culemann).

[1] Heineken enumerates six editions, of which one has inscriptions in German. See also an article by Gnichard, in *Bull. du Bibliophile*, Paris, 1841.

[2] See also W. M. Conway, *Notes on the Exercitium super Pater Noster*, 1887.

[3] There is one copy in the British Museum and another in the library at Basel, this last having the date 1464 engraved on the letter A, which is mutilated in the former. A similar alphabet preserved at Dresden seems to be a copy made in Germany.

[4] Mr. W. M. Conway is of a different opinion; see *Notes on Exercitium*. Dumortier testifies to having seen another copy unaccompanied by MS. ("Notes sur l'Imprimerie," in *Bull. Acad. Roy. de Belg.*, vol. viii., 1841).

[5] No inferences can be drawn from this priority, as it merely rests on the date of a sold copy that has come to light.

[6] See Hessels, *Gutenberg*, p. 160; and Bernard, *Origine*, ii. 31.

Type 3, *continued* (till about 1457); of type 4 no further trace is found.

(ii.) *Donatus* of 24, 25, or 26 lines, 24 (?) leaves; one leaf (the 8th or 9th?) in the Mainz library.

(iii.) *Donatus* of 32 lines, 14 (?) leaves, the 10th (?) in the Mainz library.

(iv.) *Donatus* of 33 lines, two leaves in the Paris library.

(v.) *Donatus* of 35 lines, folio; printed, according to the colophon, "per Petrum de Gernssheym, in urbe Moguntina cum suis capitalibus."

(vi.) 42-line Bible (also called Mazarine Bible), printed before Aug. 15, 1456, as the binder of the paper copy in the Paris library states that he finished its rubrication on that day. 2 vols. fol., 641 leaves of 2 columns of 42 lines each, except that in some copies the columns of pp. 1–9 contain 40 lines only, while the 10th page has 2 columns of 41 lines each, though the difference in the number of lines makes no difference in the space which they occupy.[1,2]

(vii.) 42-line *Cantica ad Matutinas*. The first and only leaf known is in the Paris library. It is printed on vellum, and corresponds in every respect to the 42-line Bible, having double columns, 42 lines, etc.

The above four types and the books printed with them (besides a few others printed by Albrecht Pfister at Bamberg) are the only ones that stand in close connection with the question regarding the introduction, or the possible invention, of printing at Mainz. It has been pointed out above that one of the initial M's of the 30-line indulgence of 1454 occurs again in an indulgence of 1489, printed by Schoeffer; hence types 3 and 4 and the books printed with them must be ascribed to this printer, in spite of the fact that the capital P found in the indulgence does not seem to occur again in the 42-line Bible. No further trace of the brief type 4 has yet been found, and perhaps Schoeffer melted it down for his other types. As Schoeffer, in the colophon of the *Donatus* (v.) which bears his name alone, says that it was printed "cum suis capitalibus," and as these capitals gradually disappear after 1459 and the type of the 42-line Bible is no longer found after 1456, we must presume that the seven incunabula mentioned above were printed by Peter Schoeffer alone before he entered (in 1457) into partnership with Johan Fust.[3]

There is no such certainty as regards types 1 and 2 and the books printed with them. If the 31-line indulgence may be assumed to have been printed at Mainz, its printer was in all probability Johan Gutenberg, though it would seem from a lawsuit of 1455 (see pp. 733–4 below) between him and Fust that in that year Gutenberg had not yet printed anything, and in 1454 (1455) Fust evidently called him to account for not having produced anything. Certain circumstances point to Albrecht Pfister as the printer of the eight incunabula (i.) to (viii.) (p. 727). First, he undoubtedly printed with type 1 in that city as early as 1461, for on 14th February of that year he issued in that type an edition of Boner's *Edelstein* (88 leaves, fol., with wood engravings), and printed with the same type at least eight other works,[4] one of which was issued in 1462, the seven others without a date. Secondly, most of the copies of the 36-line Bible were at one time or another preserved in the libraries of Bavaria, and a great number of fragments have been discovered in monasteries in that country, even in a register of the abbey of St. Michael at Bamberg of the year 1460. Thirdly, a transfer of type from Gutenberg to Pfister is contrary to all analogy in the infancy of printing, when every printer started with a type of his own making. But, as there is no direct evidence as to who really possessed types 1 and 2 before 1460, we have not felt justified in assigning the 31-line indulgence and the other seven incunabula (including the 36-line Bible) to Pfister.

The *Catholicon* type.

It is alleged that, in consequence of the lawsuit between Gutenberg and Fust, the former was deprived of all tools, etc., which he had made, or is supposed to have made, with the money which the latter had advanced to him, and that afterwards a certain Dr. Homery or Humery, a syndic of Mainz, lent him fresh money to enable him to establish another printing office. This allegation is made on the strength of a letter of obligation (of 26th February, 1468), given by Dr. Homery to Adolph, the archbishop of Mainz, by which he acknowledges to have received from the said archbishop "several forms, letters, instruments, implements, and other things belonging to the work of printing, which Johan Gutenberg had left after his death, and which had belonged and still did belong to him (Dr. Homery)." It is presumed that with these types, which we may call the Mainz type No. 5, Gutenberg printed (i.) Joannes de Balbis, *Catholicon*, 1460, 373 leaves, folio, 2 columns of 66 lines each, copies of which exist in the Cambridge university library, three in the British Museum, two in the Paris library, in Lord Spencer's library, in the Wolfenbüttel and Mainz libraries, etc.; (ii.) Matthæus de Cracovia, *Tractatus Rationis*, 22 leaves, 4to, 30 lines, three copies of which are in the British Museum, one at Althorp, one in the Cambridge library, two in the Paris library, etc.; (iii. and iv.) Thomas Aquinas, *Summa de Articulis Fidei*, two editions in 4to, the first of 13 leaves and 34 lines,—two copies of which are in the British Museum, one in Lord Spencer's, the Cambridge library, etc., and the second of 12 leaves and 36 lines,—copies in the British Museum and the Paris library; and (v.) indulgence of 1461 of 15 lines.

On 18th January, 1465, Adolph II., archbishop of Mainz, appointed "Johan Gudenberg, on account of his grateful and willing service, his servant and courtier (*dhiener und hoffgesind*) for life, promising to supply him with clothing and each year 20 'malter' of corn and 2 'fuder' of wine." It has always been inferred from this that Gutenberg had quitted Mainz and gone to Eltville (Elfeld) to reside at the archbishop's court, and that, his dignity as courtier preventing him from printing himself, he passed the *Catholicon* types on to Henry Bechtermuncze at Eltville. But recent researches have shown that Gutenberg remained at Mainz till his death in 1468. We certainly find in 1467 the *Catholicon* type with some additions (already found in the indulgence of 1461) at Eltville near Mainz, in the hands of Henry and Nicholas Bechtermuncze and Wigandus Spyes de Orthenberg, who finished on 4th November of that year (vi.) *Vocabularius ex quo* (a Latin-German vocabulary) in 4to, 166 leaves, 35 lines, the only known copy of which is in the Paris library, and (vii.) *Vocabularius ex quo*, second edition, with colophon dated 5th June, 1469, 4to, 165 leaves, 35 lines, copies of which exist in Lord Spencer's library, at Blenheim, and in the Paris library. Now it is asked how the Bechtermunczes could have been using the *Catholicon* type in 1467, if we assume that it was this type to which Homery refers in his letter of obligation as being in his possession. Some, therefore, conclude that the *Catholicon* and the four other works in the same type were printed at Mainz by Henry Bechtermuncze, who may afterwards have transferred his printing office to Eltville. In that case it is difficult to see what type Homery could refer to, unless it were type 2, a close imitation of which, if not the actual type, was used by Nicholas Bechtermuncze at Eltville in printing (12th March, 1472) a third edition of the *Vocabularius ex quo*, 166 leaves, 35 lines, copies of which are preserved in the Paris and Hamburg libraries, and an edition of Thomas Aquinas, *Summa de Articulis Fidei*, 12 leaves, 35 lines (Munich library).

It is necessary to point out that for nearly seventy years eight books—(1) *Prognostication* or *Calendar*; (2) Hermann de Saldis, *Speculum Sacerdotum*; (3) *Tractatus de Celebratione Missarum*; (4) a work in German treating of the necessity of councils; (5) *Dialogus inter Hugonem Cathonem et Oliverium super Libertate Ecclesiastica*; (6) Sifridus de Arena, *Determinatio Duarum Quæstionum*; (7) Id., *Responsio ad Quatuor Quæstiones*; (8) *Klagspiegel*, or *New geteutscht Rechtbuch*—have been ascribed to Gutenberg on the strength (*a*) of the date 1460, which was said to be found in the *Prognostication* in the Darmstadt library, and (*b*) of a so-called rubrication alleged to be in a copy of the *Tractatus de Celebratione Missarum*, in which "Johannes dictus a bono monte" and Johannes Numeister are represented as offering this work on 19th June, 1463, to the Carthusians at Mainz. But the date in the *Prognostication* has been falsified from 1482 into 1460, and the rubrication in the *Tractatus* is a forgery.[5] The eight books are now considered to have been printed by Erhard Reuwich.

When we set aside the above works, there is no further difficulty as regards the history of Mainz printing. Fust and Schoeffer worked together from 1457 to 1466, starting in August, 1457, with an edition of the *Psalterium*, printed in large missal types, which, as far as we know, is the first printed book which bears a date, besides the place where it was printed and the name of the printers. It was reprinted with the same types in 1459 (the second printed book with date, place, and name of printer), in 1490, and in 1502 (the last work of Schoeffer, who had manufactured its types). In 1459 Fust and Schoeffer also published Gul. Durandus, *Rationale Divinorum Officiorum*, with the small type (usually called Durandus type) with which they continued to print long afterwards. In 1460 they published the *Constitutiones* of Pope Clement V., the text printed in a type (Clement type) about a third larger than the Durandus. This type was, however, in existence in 1459, as the colophon of the Durandus is printed with it.[6]

[1] For other copies, see Bernard, *Origine*, i. (164, 177–192; and Hessels, *Gutenberg*, 170.

[2] [A copy of the Mazarine Bible is in the Lenox Library, New York, and another in private hands in the same city. But 29 extant copies are known.—Am. Ed.]

[4] See Hessels, *Gutenberg*, p. 161 *sq.*

[5] See Hessels, *Gutenberg*, pp. 107–114.

[6] See further Bernard, *Origine de l'Imprimerie*, i. 216 *sq.*

Spread of Typography.

Spread of typography.

Having explained the early printing of Mainz, in so far as it bears upon the controversy (see below) as to where and by whom the art of printing was invented, we can follow its spread to other countries. After Mainz it was first established in 1460 at Strasburg, where the first printers were,—1. Johann Mentelin, who completed a Latin Bible in that year, according to a rubrication in a copy at Freiburg in the Breisgau; 2. Adolph Rusch de Inguilen, who is presumed to be the printer of the undated books with a singularly shaped R,[1] *c.* 1464; 3. Henricus Eggesteiu, 1471; 4. George Husner; 5. Martin Flach, etc. In 1461 at Bamberg, where the first printer was Albrecht Pfister, who in that year published Boner's *Edelstein*, though it is still doubtful whether he did not print earlier (see above); 2. Joh. Sensenschmidt, *c.* 1480. 1465 at Subiaco; first and only printers Conrad Sweynheym and Arnold Pannarts, who completed in that year an edition of Cicero, *De Oratore*, and Lactantius, and removed to Rome in 1467. In 1466 at Cologne, the printers being—1. Ulrich Zell, who published in that year Chrysostom, *Super Psalmo Quinquagesimo Liber Primus*, though it is presumed that he printed in 1463; 2. Arnold Ther Hoernen, 1470; 3. Johannes Koelhoff of Lübeck, 1470, who printed the *Cologne Chronicle* in 1499; 4. Nicolaus Götz, 1474; 5. Goiswinus Gops, 1475; 6. Petrus de Olpe, 1476 (not 1470); 7. Conradus Winter of Homburg, 1476; 8. Joh. Guldenschaaf, 1477; 9. Henricus Quentel, 1479, etc.[2] 1467 at Eltville; first printers Nicolas and Henry Bechtermuncze and Wygandus Spyes de Orthenberg, who completed in that year a *Vocabularius ex quo*. 1467 at Rome; first printers Conrad Sweynheym and Arnold Pannarts from Subiaco, who published an edition of Cicero's *Epistolæ ad Familiares*, and Ulrich Hahn or Udalricus Gallus, who issued on 31st December, 1467, Turrecremata's *Meditationes*. 1468 at Augsburg; first printer Günther Zainer or Zeyner. Same year at Basel; first printer Berthold Rot of Hanau. Same year at Marienthal; Brothers of the Common life. 1469 at Venice; printers,—1. Johannes of Spires; 2. his brother Vindelinus of Spires; 3. Christopher Valdarfer; 4. Nicolas Jenson, etc. The further spread of typography is indicated by the following data: 1470 at Nuremberg (Johan Sensenschmidt, Friedr. Creusner, Anton Koberger, etc.), Berona or Beromünster in Switzerland (Helyas Helye *alias* De Louffen), Foligno (Emilianus de Orfinis and Johannes Numeister), Trevi (Johann Reynard), Savigliano (Hans Glim), Paris (first printers the three partners Ulrich Geriug, Michael Friburger, Martin Krantz); 1471 at Spires, Bologna, Ferrara, Florence, Milan, Naples, Pavia, Treviso, Savigliano (?); 1472 at Esslingen, Cremona, Mantua, Padua, Brescia, Parma, Monreale (Mondovi), Fivizzano, Verona, Iesi (?), St. Ursino (?); 1473 at Lauingen, Ulm (perhaps as early as 1469), Merseburg, Alost, Utrecht, Lyons, Messina, Buda; 1474 at Louvain, Genoa, Como, Savona, Turin, Vicenza, Valencia (?); 1475 at Lübeck, Breslau, Blaubeuren, Burgdorf, Trent, Cracow (?), Modena, Reggio (in Calabria), Cagli, Caselle or Casale, Pieve (Piove) di Sacco, Perugia, Piacenza, Saragossa; 1476 at Rostock, Bruges, Brussels, Angers, Toulouse, Polliano (Pogliano); 1477 at Reichenstein, Deventer, Gouda, Delft, Westminster, Lucca, Ascoli, Palermo, Seville; 1478 at Oxford, St. Maartensdyk, Colle, Schussenried (in Würtemberg), Eichstädt, Geneva, Vienne, Trogen (?), Chablis, Cosenza, Prague, Barcelona; 1479 at Erfurt, Würzburg, Nimeguen, Zwolle, Poitiers, Toscolano, Pinerolo, Novi, Lerida, Segorbe; 1480 at London, St. Albans (or in 1479), Oudenarde, Hasselt, Reggio (in Modena), Salamanca, Toledo, Nouantola, Friuli (?), Caen; 1481 at Passau, Leipsic, Magdeburg, Treves, Urach, Casale di San Vaso, Saluzzo, Albi, Rougemont (?); 1482 at Reutlingen, Memmingen, Metz, Pisa, Aquila, Antwerp, Promentour, Zamora, Odense; 1483 at Leyden, Kuilenburg (Culenborg), Ghent, Chartres, Chalons-sur-Marne (?), Troyes, Gerona, Stockholm; 1484 at Bois-le-Duc, Siena, Udine, Soncino, Winterberg, Klosterneuburg, Rennes, Loudéac; 1485 at Heidelberg, Ratisbon, Pescia, Vercelli, Tréguier or Lantreguet, Salins, Burgos, Palma, Xeres; 1486 at Müuster, Stuttgart, Chiavasco, Voghera, Casal Maggiore, Abbeville, Brünn, Schleswig; 1487 at Ingolstadt, Gaeta, Rouen, Murcia; 1488 at Stendal, Viterbo, Gradisca, Besançou, Constantinople; 1489 at Hagenau, San Cucufat (near Barcelona), Coria, Pamplona, Tolosa, Lisbon; 1490 at Orleans, Grenoble, Dôle; 1491 at Hamburg, Nozzano, Goupillières, Angoulême, Dijon, Lantenac; 1492 at Zinna, Valladolid, Leiria; 1493 at Lüneburg, Cagliari, Freiburg (in Breisgau), Urbino, Acqui; 1494 at Oppenheim, Monterey, Braga; 1495 at Freisingen, Freiberg, Scandiano, Forlì, Limoges, Schoonhoveu (monastery Den Hem), Wadstena, Cettinje; 1496 at Offenburg, Provins, Granada; 1497 at Munich, Barco, Carmagnola, Avignon; 1498 at Tübingen, Perigueux, Schiedam, Tarragona; 1499 at Moutserrat, Madrid; 1500 at Olmütz, Pforzheim, Sursée, Perpignan, Valenciennes, Jaen. Printing was introduced into Scotland in 1505 by the establishment of Andrew Millar at Ediuburgh,[3] and into Ireland, at Dublin, in 1551. As for non-European countries and towns, printing was established in Mexico in 1544, at Goa about 1550, at Tranquebar in 1569, Terceira in the Azores 1583, Lima 1585, Manila and Macao (China) 1590, in Hayti in the beginning of the 17th century, at Puebla in 1612, Cambridge (Mass.) 1638, Batavia 1668, Tiflis 1701, Germantown 1735,[4] Ceylon 1737, Halifax (Nova Scotia) 1766, Madras 1772, Calcutta 1778, Buenos Ayres 1789, Bombay 1792, in Egypt (at Alexandria, Cairo, and Gizeh) in 1798, at Sydney 1802, Cape Town 1806, Montevideo 1807, Serepta 1808, Valparaiso 1810, Astrakhan 1815, in Sumatra and at Hobart Town and Santiago (in Chili) in 1818, in Persia (at Teheran) in 1820, and at Chios about 1821.[5]

Customs of early printers.

Till the moment (say 1477) that printing spread to almost all the chief towns of Germany, Italy, Switzerland, France, the Netherlands, Spain, England, not a single printer carried away with him a set of types or a set of punches or moulds from the master who had taught him, but, in setting up his printing office, each man cast a set of types for his own use, always imitating as closely as possible the handwriting of some particular manuscript which he or his patron desired to publish. When we compare Schoeffer's 30-line indulgence of 1454 with a manuscript copy of the same indulgence dated 10th April, 1454, now in the hands of a private collector at Wiesbaden, we see that the types used in printing that document were specially cast for the purpose after the model of the handwriting employed for the written copies. We know also that the types of the 36-line and 42-line Bibles and those of the psalter of 1457 are the closest possible imitations of the ornamental church handwriting customary at the time of their production. Also, when we compare the 31-line indulgence of 1454 with the German block-book called the *Enndtchrist*, and both in their turn with the German MSS. of that period (especially the manuscript portions in the printed copies of the indulgences), we see that the cutter of the text type of the indulgence, as well as the engraver of the block-book, formed his characters according to some German handwriting (book hand) of the period. This imitation extended, not only to the shape of the letters, but likewise to all those combinations of letters (double *p*, double *f*, double *s*, *st*, *ti*, *tu*, *re*, *cu*, *ct*, *si*, *de*, *co*, *ci*, *te*, *ce*, *or*, *ve*, *po*, *fa*, *he*, *be*, etc.) and contractions (for *pro*, *-um*, *-em*, *-en*, *the-*, *uer-*, *-bus*, *-bis*, *sed*, *am*, *tur*, *qui*, *quæ*, *quod*, *secundum*, etc.) which were then, and had been for many centuries, in use by scribes. In most, if not all cases, the MSS. which the printers imitated were indigenous to the place where they settled. Thus the first printers of Subiaco, though they were Germans and had most probably learned the art of casting types and printing at Mainz, clearly cut their types after the model of some Italian MS. which was free from any Gothic influence, but written in a pure Caroline minuscule hand, differing but slightly from the Caroline minuscules which the same printers adopted two years afterwards at Rome. The first Paris printers started in 1470 with a type cast in the most exact manner, on the model of the Caroline minuscule handwriting then in vogue at Paris. John de Westphalia, who introduced printing into Belgium, used from the beginning a type which he calls Venetian. Where therefore there is a great similarity, but no absolute identity, between the types of two printers (*e.g.*, Schoeffer and Ulr. Zell), it should be attributed to the similarity of the handwritings which the printers followed rather than to any attempt on their part to imitate each other's types. To this universal system (clearly discernible in the first twenty-five years of printing) of each printer setting up business

[1] M. Philippe, *Origine de l'Imprimerie à Paris*, p. 219, mentions two books printed in this type, which contain manuscript notes to the effect that they were purchased in 1464 and 1467, so that Inguilen should be placed before Eggestein.

[2] Johan Veldener, who is said to have printed at Cologne, was never established there, but at Louvain (1473–77), Utrecht (1478–81), and Culenborg or Kuilenburg (1483–84); see Holtrop, *Mon. Typ.*, pp. 42, 47, 109.

[3] See Rob. Dickson, *Introd. of Art of Print. into Scotl.*, Aberdeen, 1885.

[4] [The Germantown venture of 1735 was Sower's foundry, chiefly for German type. Printing was introduced into Pennsylvania by William Bradford (1658–1752), one of the Quakers brought over by William Penn, and who set up his press in Philadelphia in 1685. He afterwards removed to New York, where he printed the *Laws* of the colony in 1693.—Am. Ed.]

Deschamps) *Dict. de Géogr. à l'Usage du Libraire*, 8vo, Paris, 1870; R. C. Hawkins, *Titles of the First Books from the Earliest Presses Established in Different Cities in Europe*, 4to, New York, 1884.

with a new type cast by himself, there are, according to the conjectures of a good many bibliographers, only two exceptions. One is Albrecht Pfister (see above); the other is the Bechtermunezes of Eltville (see above).

Another most important feature in the earliest books is that the printers imitated, not only the handwriting, with all its contractions, combined letters, etc., but all the other peculiarities of the MSS. they copied. There is in the first place the unevenness of the lines, which very often serves as a guide to the approximate date of a book, especially when we deal with the works of the same printer, since each commenced with uneven lines, and gradually made them less uneven, and finally even. This unevenness was unavoidable in manuscripts as well as in block-books; but in the earliest printed books it is regarded as evidence of the inability of the printers to space out their lines. If this theory be correct, this inability was perhaps owing to the types being perforated and connected with each other by a thread, or to some other cause which has not yet been clearly ascertained. But it is not impossible that the unevenness was simply part and parcel of the system of imitating MSS. and that only gradually (about 1473 or 1474, but in some cases later) printers began to see that even lines looked better than uneven. This seems clear when we observe that the imitation of MSS. was carried so far that sometimes things which deviated from the work of the scribe, but had accidentally been printed in, were afterwards erased and altered in conformity with the MS. The Paris library, for instance, possesses two copies of the *Liber Epistolarum* of Gasparinus Pergamensis (printed at Paris in 1470) in both of which the inital G of the first line and the initial M of the fourth line were printed in, and, whilst they have been allowed to remain in one of the copies, in the other they were regarded as a fault and replaced by a rubricated L and M.

Unevenness of lines.

In the second place the initials of books or the chapters of books in MSS., and again in block-books and the earliest products of printing, were always, or at least in most cases (they are printed in the indulgences of 1454), omitted by the scribe and the printer, and afterwards filled in by the rubricator. As the latter artists were sometimes illiterate and very often filled up the gap by a wrong initial, we find in a good many MSS. as well as early printed books small letters written either in the margin or in the blank left for the initial, to guide the rubricator. In most cases where these letters (which are now called initial directors) were written in the margin, they were placed as much as possible on the edges of the pages in order that they might be cut away by the binder as unsightly; but in a vast number of incunabula they have remained till the present day.[1] After a few years these initial directors were in a good many books printed in (in lower-case type) with the text. In all cases, whether written or printed, they were meant to be covered by the illuminated initial; but, as a matter of fact, the latter very seldom covers the initial director so completely as to make it invisible, and in a good many cases the intended illumination was never carried into effect.

Initials.

With respect to the hyphens, which were used in the 1454 indulgences and the 36-line and 42-line Bibles, always outside the printed margin, some of the earliest printers did not employ them at the moment that they started their presses, and in the case of some printers the non-use or use of hyphens, and their position outside or inside the printed margin, serve as a guide to the dating of their products. After about 1472 they become more uniform in their shape and more generally used.

Hyphens.

The use of signatures is confined in MSS. mostly to mark the quires, and in block-books to mark each sheet or page; they do not occur in printed books before 1472 (at least in no earlier book with a date), when they appear in Joh. Nider's *Præceptorium Divinæ Legis*, published by Johan Koelhoff at Cologne.

Signatures.

Catchwords (*custodes*) were used for the first time about 1469 by Johannes of Spires, at Venice, in the first edition of Tacitus.

Catchwords.

Pagination or rather foliation was first used by Arn. Ther Hoernen, at Cologne, in 1471, in Adrianus's *Liber de Remediis Fortuitorum Casuum*, having each leaf (not page) numbered by figures placed in the end of the line on the middle of each right-hand page.

Pagination.

[1] The university library of Basel possesses a collection of the earliest Paris books still bound in their original binding, in which these initial directors are written not only on the outer edges but on the inner sides of the pages, and so close to the back that they can only be seen by stretching the books wide open.

The practice among early printers of imitating and reproducing MSS. was not abandoned till many years after the first printed book (1454) made its appearance; and, looking at the books printed, say from 1454 to 1477, from our present standpoint of daily improvement and alteration, the printing of that period may be said to have been almost wholly stagnant, without any improvement or modification. If some printers (for instance, Sweynheym and Pennarts at Subiaco and Rome, and Nicolas Jenson at Venice) produced handsomer books than others, this is to be attributed to the beauty of the MSS. imitated and the paper used rather than to any superior skill. Generally speaking, therefore, we shall not be very far wrong in saying that the workmanship of Ketelaer and De Leempt's first book, published at Utrecht *c.* 1473, and that of Caxton's first book issued at Westminster in 1477, exhibit the very same stage of the art of printing as the 1454 indulgences. If therefore any evidence were found that Ketelaer and De Leempt and Caxton had really printed their first books in 1454, there would be nothing in the workmanship of these books to prevent us from placing them in that year. And conversely, if the indulgences of 1454 had been issued without a date or without any names to indicate their approximate date, their workmanship would invariably induce bibliographers to ascribe them to *circa* 1470, if not somewhat later. Even after 1477 the alterations in the mode of printing books proceeded very slowly and almost imperceptibly. It came to be no longer a universal system for printers to begin business by casting a type for themselves, but some received their types from one of their colleagues. And, though there were still many varieties of types, one sort began to make its appearance in two or three different places. The combinations of letters were the first to disappear; but the contractions remain in a good many books even of the 17th century.

Slowness of progress at first.

Some theories have been based on, and others have been considered to be upset by, the supposition that the early printers always required as much type as printers of the present day, or at any rate so much as would enable them to set up, not only a whole quire of 4 or 5 sheets (= 8 or 10 leaves = 16 or 20 pages), but even two quires (= 40 pages). Consequently calculations have been made that, for instance, the printer of the 42-line Bible required a font of at least 120,000 characters.[2] But, though the *Speculum Humanæ Salvationis* seems to have been printed by whole sheets (2 pages), there are numberless proofs that many early books were printed page by page, even when in small 4to. For instance, in some books it has been observed that portions of the types with which the text of the first, second, or third pages of a quire had been printed were used to "lock up" the types employed for the later pages of the same quire, as is evident from the blank impressions of such portions being found on these later pages. Again, in some books two, three, or four blank leaves are found at the end, showing a miscalculation of the printer. Moreover, the numerous itinerant printers of the 15th century, who established a press for a short time wherever they went, prove that the furniture of the earliest printing offices must have been of no great extent.

The Invention Controversy.

Now that we have traced the art of printing from the moment (1454) that it made its appearance in a perfect state at Mainz, and have followed its spread to all the chief places of Europe till 1500, we must take notice of the controversy which has been carried on for nearly four hundred years as to when, where, and by whom the art was invented. For this purpose we will gather up into a chronological sequence (*a*) a few of the most important expressions used by the earliest printers in their colophons, (*b*) whatever documentary evidence there may be on the subject, and (*c*) some accounts of the earliest authors on the subject. (The letters A, B, etc., are for the sake of convenient reference.)

Controversy as to invention of printing.

The earliest testimony (A) to which we may refer is the notarial instrument, dated 6th November, 1455, of the lawsuit between Fust and Gutenberg, whereby the former sought to recover 2026 guilders from the latter in repayment of 1600 guilders (800 advanced in 1450 or 1449 and another 800 in

Early testimonies.

[2] See Bernard, *Origine de l' Impr.*, i. 164, who was a printer himself and speaks very strongly on this point.

1452), with the interest thereon. Fust speaks here[1] of "the work" (line 24), and of "onr common work" (line 60); Gutenberg speaks of "tools" in preparation "workmen's wages, house-rent, vellum, paper, ink, etc." (lines 37–40), of "such work" (41), and of "the work of the books" (42); whereas the judges speak of "the work to the profit of both" (49), and "their common use" (60). (B) In the earliest[2] book published with a date (the Mainz psalter, issued 14th August, 1457, by Fnst and Peter Schoeffer) it is said that it was perfected at Mainz by an "adinventio artificiosa imprimendi ac caracterizandi absque calami nlla exaratione" (repeated and varied later; see p. 723 above). (C) In 1460, the *Catholicon* was published at Mainz, without the name of the printer; bnt the colophon, after stating that the book was printed at Mainz, which town God's mercy had deigned to prefer above other natious of the earth, adds (D) that the book was printed and completed "non calami, stili, aut pennæ suffragio, sed mira patronarum formarnmqne concordia, proporcione, et modulo." This work is considered to have been printed by Gutenberg, and the mention of God's mercy is regarded as an allusiou to the invention of printing. The phrase is, however, also fouud in the *Liber Sextus Decretalium*, in the *Summa* of Thomas Aqninas, and in the *Clementinæ*, published respectively on 17th Decemher, 1465, 6th March, and 8th October, 1467, by Fust and Schoeffer. (E) Ou 17th Jannary, 1465, Adolph II., archbishop of Mainz, by a pnblic decree, appoiuted Gutenberg as his servaut in reward for "his services," but he does not speak of him as the inventor of printing, nor even as a priuter. (F) In the *Grammatica Rhythmica*, published in 1466, by Fust and Schoeffer, the third line of the colophon runs: "Hinc Nazareni sonet oda per ora Johannis," which was formerly regarded as an allusion to Johann Fnst or Johann Gntenberg, but which more probably refers to Johann Brnnnen or Fons, the author of the grammar. (G) On 26th February, 1468, Dr. Homery wrote to the archbishop of Mainz the letter quoted above, from which it may be inferred that Gutenberg had been a printer, though not a word is said as to his being the inventor of printing. (H) In 1468 Schoeffer reprinted Fons's *Grammatica*, and in the colophon it is said: "At Moguntina sum fusus in urbe libellus meqne (the book) domus genuit unde caragma venit." (I) Schoeffer published on 24th May, 1468, the first edition of *Justiniani Imper. Institutionum Juris Libri VI., cum Glossa.* To this were added by way of colophon some verses commencing: "Scema tabernaculi, etc.," in which it is said that (the ornament of the chnrch) Jesns "hos dedit eximios sculpendi in arte magistros . . . Qnos gennit ambos urbs Moguntina Johannes, librornm insignes prothocaragmaticos," which is regarded as an allusiou to Johann Gutenberg and Johann Fust as first printers. (K) In the same year (1468) Johannes Andreas, bishop of Aleria, says, in the dedication of his edition of St. Jerome's *Epistles*, published in that year (13th December) at Rome, to Pope Paul II., that "Germany is to be honored for ever as having been the inventress of the greatest utilities. Cardinal Cusa wished that the sacred art of printing, which then (under Cardinal Cusa, who died 11th Augnst, 1464), seemed to have arisen in Germany, were brought to Rome." (L) In 1470 Guil. Fichet, in au octastichon inserted in the Paris edition of 1470 of the *Letters* of Gasparinus of Bergamo, exhorts Paris to take up the almost divine art of writing (printing) which Germany is acqnainted with. In the same year Erhard Windsberg writes to the same effect in an epigram inserted in the *Epistolæ Phalaridis* published at Paris abont 1470. (M) In 1471 Ludov. Carbo speaks, in the dedication of the *Letters* of Pliny to Borso, duke of Modena, of the Germans having invented printing. Nicolaus Gupalatinus speaks (Venice, 1471), of a German being the inventor of printing, and Nicolans Perottus of the art which had lately come from Germany. (N) On 21st May, 1471, Nicolas Jenson pnblished an edition of Qnintilian, edited and revised by Ognibene de Lonigo (Omnibonus Leonicenus), who in the preface speaks of its printer as "librariæ artis mirabilis inventor, non ut scribantur calamo libri, sed veluti gemma imprimantnr, ac prope sigillo, primus omnium ingeniose demonstravit." (O) About 1472 the first three printers of Paris pnblished Gasparinus Pergamensis's *Orthographiæ Liber*, to which is prefixed (in the copy of the university of Basel) a letter, dated 1st January, from Gnillaume Fichet, prior of the Sorbonne, to Robert Gagnin, in which he says that "it is rumored in Germany that not far from the city of Mainz a certain Johann Gutenberg (Johannes, cni cognomen Bonemontano) first of all invented the art of printing (impressoriam artem), by means of which books are made with letters of metal, not with a reed (as the ancients did), nor with the pen (as is done at present)." (P) On 14th July, 1474, Joh. Philippus de Lignamine published at Rome *Chronica Summorum Pontificum Imperatorumque*, in which we find, between two entries, relating one to 14th July, 1459, and the other to 1st October, 1459, an undated paragraph in which it is said that Jacobus with the snrname of Gutenberg of Strasbnrg and a certain other one named Fustus, "imprimendarum litterarnm in membranis cum metallicis formis periti, trecentas cartas qnisque eornm per diem. facere innotescunt apud Moguntiam Germanie civitatem." The same is said of Meutelin, and (nnder 1464) of Conrad Sweynheym, Arnold Pannarts, and Udalricus Gallus. (Q) On 23d May, 1476, Peter Schoeffer issued the third edition of the *Institutiones* of Justinian, with the same imprint as in the edition of 1468 (see testimony I), but with the addition that Mainz is the "impressoriæ artis inventrix elimatrixque prima." (R) In 1478 an edition of the *Fasciculus Temporum* was issued at Cologne, in which it is stated under the year 1457 that the printers of books were mnltiplied on earth, deriving the origin of their art from Mainz. The earlier editions merely stated that the printers of books were multiplied on earth. (S) In 1483 Matthias Palmerius of Pisa pnblished at Venice the *Chron. Euseb.*, in which under the year 1457 it is stated that students owe a great debt to Germauy, where Johannes Gnttenberg znm Jungen, knight of Mainz, invented the art of priuting in 1440. (T) In the same year Jac. Phil. Foresta of Bergamo published *Supplementum Chronicorum*, in which he says under the year 1458 that the art of printing books was first discovered in Germany, according to some by Guthimberg of Strasburg, according to others by Fanst (see P), according to others by Nicolas Jenson (see N). (V) On 6th March, 1492, Peter Schoeffer pnblished the *Niedersächsische Chronik* of Conrad Botho, saying in the colophon that it was "geprent . . . in . . . Mentz, die eyn anefangk is der prentery." (X) At the end of 1494 two Heidelberg professors, Adam Wernher and Joh. Herbst, composed some Latin verses in honor of Johannes Gensfleisch (a family name by which Gutenberg was known, and which was turned into the Latin Ansicarus), whom they called "primus librorum impressor" and "impressoriæ artis inventor primus."[3] (Y) In 1499 Jacobus Wimpheling (boru at Schlettstadt 1450, died 1528) published (at Mainz, by P. Friedberg) an *Oratio in Memoriam Marsilii ab Inghen* (d. 1396), in which he, on leaf 22a, praises Joannes Ansicarus in verse on account of his invention at Mainz. (Z) These verses are preceded by an epitaph on Johann Gensfleisch, "artis impressoriæ inventor" and "repertor," written in Latin by Adam Gelthus, a relative of Gutenberg. (AA) In the same year Polydore Vergil (*De Inventoribus Rerum*, Venice, 1499, lib. ii. cap. 7) says that a certain Peter [Schoeffer?], a German, invented in 1442 the art of printiug at Mainz in Germany, as he had heard from the latter's couutryman; this statement was repeated in a Venice edition of 1503. In later editions "Peter" was altered to "Joh. Gutenberg." (BB) In the same year Koelhoff, printer at Cologne, published *Cronica van der hilliger Stat van Coellen*, in which on fol. 312b it is said: (1) The art of printing was fonnd first of all in Germany at Mainz about the year 1440; (2) from that time till 1450 the art and what belonged to it were investigated; (3) and in 1450, when it was a golden year (jubilee), they began to print, and the first book that they printed was the Bible in Latin, in a large letter, resembling that with which at present missals are printed. (4) Althongh the art was found at Mainz in the manner in which it is generally employed now, yet the first prefiguration was fonnd in Holland from out the *Donatuses* which were printed there before that time, and from and out of them was taken the beginning of the aforesaid art, and it was found much more masterly and exact (*subtilis*) than that other manner was, and has become more and more artistic. (5) Omnibonus wrote in a preface to Qnintilian, and in some other books too, that a Walloon from France, named Nicol. Jenson (see N), discovered this art; but that is untrne, for there are those still alive who testify that books were printed at Venice before Nicol. Jenson came there, and began to cut and make letters. (6) But the first inventor of printing was a citizen of Mainz, named Junker Johan Gudenburch. (7) From Mainz the art was introdnced first of all into Cologne, then into Strasbnrg, and afterwards into Venice. (8) The origin and progress of the art were

From book colophons, etc.

From documentary evidence.

[1] We quote from the text of the instrument as published by J. D. Koehler, *Ehren-Rettung Johann Guttenberg's*, Leipsic, 1741.

[2] The earliest is perhaps the *Donatus* issued by Peter Schoeffer, possibly before 1456, the colophon of which says that it was finished: "Arte nova imprimendi seu caracterizandi . . . absque calami exaratione."

[3] These verses were not published at the time, but in the 19th century by F. J. Mone, *Quellensamml. der bad. Landesgesch.* iii. 163, from the contemporary MS. of Adam Wernher, preserved in the archives of Carlsrnhe.

told to the writer verbally by Ulrich Zell, of Hanau, still printer at Cologne (*anno* 1499), through whom the said art came to Cologne. (CC) In 1501 Jacob Wimpheling (see Y), who stated in his *Oratio Querulosa contra Invasores Sacerdotum, Flaminum*, etc., published at Delft *c.* 1495, that chalcography had been invented at Mainz, published a work (*Germania*, Strasburg, Joh. Prüss, 1501) in which he says (on p. 43) that the invention was made at Strasburg by Johann Gutenberg of Strasburg, and that it was perfected at Mainz. (DD) In 1503 Johann Schoeffer (the son of Peter Schoeffer and the grandson of Johann Fust) published an edition of Hermes Trismegistus, in which he represents himself as one of the most distinguished citizens of Mainz, descended from the most fortunate race who invented the art of printing. (EE) In 1504 Ivo Wittig, who was a relative of Gutenberg, and a canon and the keeper of the seal of the St. Victor cathedral near Mainz (of which Gutenberg had been a lay member), erected in the house "Zum Gutenberg" a memorial stone and an epitaph to Joh. Gutenberg of Mainz, "qui primus omnium litteras ære imprimendas invenit." (FF) In 1505, in the German translation of Livy published by Johann Schoeffer (see KK), the dedication to the emperor Maximilian, which was probably written by Ivo Wittig (see EE), speaks of Johann Gütenbergk as inventor of printing (1450) and Johann Faust and Peter Schoeffer as improvers of the art. This work was reprinted six times (1514, 1523, 1533, 1551, 1553) with the same dedication; but in 1509 the *Breviarium Moguntinum* says that it was printed at the expense and trouble of Johann Schoeffer, whose grandfather (*i.e.*, Johann Fust) was the first inventor and author of the art of printing (see DD). (GG) In 1505 Jacob Wimpheling, in his *Epithoma Germanorum* (Strasburg, 1505), asserts (on leaf xxxviii b. and xxxix a.) that in 1440 Johann Gutenberg of Strasburg invented there the art of printing. And in 1507, in his *Catal. Episcoporum Argent.* (Strasburg, 1507), he says that the art was invented, though in an imperfect manner, by a certain Strasburger, who afterwards went to Mainz and joined others working and trying the same art, where it was, under the guidance of Johann Gensfleisch, perfected in the house "boni montis" (Gutenberg). This he repeated in 1515. (HH) About 1506 Johannes Trithemius wrote his *Chronicon* of Spanheim, published at Frankfort in 1601, in which he says (p. 366) that the art of printing books was discovered afresh at Mainz by Johan Gutenberg, who, after having spent all his property in accomplishing the new invention, perfected it by the advice and assistance of Johann Fust. The first propagator of the new art was, after the inventor, Peter Schoeffer. (II) In 1515 Johann Schoeffer published Joh. Trithemius's *Compendium sive Breviarium Historiæ Francorum*, and said in the colophon that the book was published at Mainz, the first inventress of the art of printing, by Johann Schoeffer, grandson of the late Johann Fust, the first author of the said art, who finally from his own genius commenced to excogitate and to investigate the art in 1450, and in 1452 perfected it and commenced printing, assisted by many necessary inventions of Peter Schoeffer von Gernsheim, his servant and adopted son. Johann Fust and Peter Schoeffer kept this art secret, binding all their servants and domestics by oath never to reveal it; but in 1462 it was spread by the same domestics into divers countries. (KK) On 9th December, 1518, the emperor Maximilian accorded to Johann Schoeffer the privilege of printing Livy (1518–1519), and says in it that "he has learned and been advised on the faith of worthy testimonies that the ingenious invention of chalcography was effected by the printer's grandfather." (LL) In 1519 Joh. Thurmayer Aventinus (1474–1534) wrote that "in 1450 Joannes Faustus, a German, a citizen of Mainz, invented a new kind of writing, called chalcography, and completed it in two years; it was kept secret by him and Peter Schoeffer, his son-in-law, but divulged in Germany ten years afterwards by Faust's servant, Johannes Guttenberger, a Strasburger." (MM) In a pedigree of Lourens Janszoon Coster of Haarlem and his descendants, drawn up not later than 1520, it is asserted that in 1446 "he brought the first print into the world." This document, of which the date 1446 seems to have been altered into 1440, is preserved in the Haarlem town library. (NN) In 1520 Johan Schott, a printer at Strasburg, and grandson of Johan Mentelin, the first printer of that town, published an edition of Ptolemy, at the end of which he printed the arms of his grandfather with the following legend: "Insigne Schottorum Familiæ ab Friderico Rom. Imp. III. Joan. Mentelio primo Typographiæ inventori ac suis concessum: Anno Christi 1466." Apart from the assertion that Mentelin was the inventor of printing, we may remark that the emperor Frederick III. raised Mentelin to the rank of a nobleman in 1466 and granted him new arms. (OO) About 1533 the Neapolitan Mariangelo Accorso, who had resided at the court of Charles V., wrote on an edition of *Donatus* (in the possession of Aldus Manutius, jun.) that "Joh. Faust of Mainz first discovered the art of printing with metal types, which afterwards he made of lead; his son Peter Schoeffer added afterwards much to polish the said art. This *Donatus* and *Confessionalia* were printed first of all in 1450. Faust derived the suggestion from a *Donatus* printed before in Holland from an engraved block." This paragraph is found on p. 411 of the *Biblioth. Apost. Vaticana* of Angelo Rocca (Rome, 1591). Some consider its latter part to have been derived from the *Cologne Chronicle* (BB), and it seems probable that it was a mixture of some of the above testimonies. (PP) In 1536 Johan Schott (see NN) published *Historien Handt-Buchlein* (Strasburg, 1536), in which (on leaf b^1 and b^2) he says that "Hans Mentlin of Strasburg invented the art, which, through infidelity, was brought to Mainz." On the strength of this and other statements (CC, GG, NN) the bicentenary of the Strasburg invention was celebrated there in 1640. (QQ) In 1541 Joh. Arnold (Bergel or) Bergellanus, who had settled as press-reader at Mainz two years previously, published his *Encomium Chalcographiæ* (Mainz, Fr. Behem, 1541, 4to), in which the lawsuit between Fust and Gutenberg (A) is alluded to for the first time. Bergel had read Tritheim's books (HH), in which the invention is ascribed to Johann Gutenberg with two coadjutors, Johann Faust and Peter Schoeffer, which he (Bergel) had heard confirmed in conversations with Mainz citizens; he had also seen some old tools prepared for the work by the originators which were still in existence. Gutenberg invented it in 1450. (RR) About 1561 Jan Van Zuren (born at Haarlem in 1517) and Dirk Volkerts Coornhert (born at Amsterdam in 1522) established a printing office at Haarlem. Of the former it is alleged that he had compiled a work on the invention of printing, which is presumed to have been lost during the siege of Haarlem in 1573. It was not publicly spoken of till 1628, when Peter Scriverius published his *Laurecranz voor Laurens Coster*. Scriverius had only found the title, preface, and introduction, in which Van Zuren contended that the first foundations of the art were laid at Haarlem, and that it afterwards accompanied a foreigner to Mainz. In this introduction he does not mention the name of the inventor, nor a date, but points in indefinite terms to the house of the inventor as still existing. (SS) In the same year (1561) Van Zuren and Coornhert published an edition of the *Officia Ciceronis*, in which the latter, in a dedication to the magistracy of Haarlem, refers to the rumor that the art of printing books was invented first of all at Haarlem, and was brought to Mainz by an unfaithful servant and much improved there. He adds that very old and dignified persons had often told him, not only the family of the inventor, but also his name and surname, and had explained the first crude way of printing, and pointed out to him the house of the first printer. (TT) In 1566 Luigi Guicciardini, a Florentine nobleman who had visited the Netherlands and had resided many years at Antwerp, finished a description of the Netherlands (published in 1567), in which, alluding to Haarlem, he speaks of the invention there according to the assertions of the inhabitants, the evidence of some authors, and other remembrances; the inventor died before the perfection of his art; his servant went to Mainz, where he perfected the art, and hence the report that it was invented there. (VV) About 1568 (it is calculated) Hadrianus Junius wrote his *Batavia*, published at Leyden in 1588, with two prefaces, dated, the one from Leyden, 6th January, 1575, the other from Delft *ad annum salutis* 1575. On p. 253 he says that the opinion that the forms of the letters whereby books are printed were first discovered at Mainz is very inveterate, but old and eminent inhabitants of Haarlem had assured him that they had heard from their ancestors that there lived at Haarlem, more than 128 years before, in a decent house then existing, near the market-place, opposite the royal palace, Lourens (son of) Jan, surnamed Coster, who, while walking in the wood near Haarlem, began to shape beechen bark first into figures of letters, by which, reversely impressed one by one on paper, he composed one or two lines to serve as an example for the children of his son-in-law. When this succeeded, he began to contemplate greater things, and first of all invented, assisted by his son-in-law Thomas (son of) Peter, a more gluey and substantial kind of ink (as the ordinary ink was found to blot), with which he printed whole tablets with pictures, with the letters added. Junius had seen books of this kind printed by Coster (the beginnings of his labors) on the rectos of the leaves only, not on both sides; the book was written (in Dutch) by an anonymous author, and entitled *Speculum Nostræ Salutis*, in which care was taken that the blank versos could be pasted together, so that the blank pages should not present any unsightliness. Afterwards (Coster) changed the beechen characters into leaden, and the latter again into tin ones. Very ancient wine-pots east of the remains of these types

were still to be seen in the house of Lourens, which was afterwards inhabited by his great-grandson Gerard (son of) Thomas, who had died an old man a few years before. When the new merchandise attracted purchasers everywhere, workmen were added to (Lourens's) household, among whom was a certain John (whether, as was suspected, Faust, or another of the same name, Junius did not inquire), who was bound to the work of printing by oath. But, when he thought he knew the art of joining the letters and of casting the types, etc., he stole away, when everybody had gone to church, the whole apparatus of the types and the tools prepared by his master, and hastened to Amsterdam, thence to Cologne, until he arrived at Mainz, where he could remain in safety, and, having opened a work-office, issued within the space of one year, about 1442, the *Doctrinale* of Alexander Gallus and the *Tracts* of Petrus Hispanus, printed with the same types which Lourens had used at Haarlem. Junius recollects that Nicolaus Gale, his tutor, a man of firm memory and venerable old age, had told him that as a boy he had often heard a certain bookbinder Cornelis (a man of more than eighty years of age, who had been an under-workman in the same office narrating the story of the invention (as he had heard it from his master), the polishing and increase of the crude art, etc., and cursing those nights which he had passed, during some months, with the culprit in one bed. The burgomaster Quirinus Talesius admitted to Junius that he had formerly heard nearly the same from the mouth of the same bookbinder. (XX) In 1628 Scriverius in his *Laurecranz* (see RR) placed the date of the Haarlem invention as far back as 1428, and mentioned as its inventor Lourens Janszoon, sheriff of Haarlem. He asserts that the art of printing appeared, "not in the manner as it is used now, with letters cast of lead and tin, but a book was cut leaf for leaf on wooden blocks," and the Haarlem inventor was robbed in 1440 by Johan Gutenberg. Scriverius based the date 1428 upon a Hebrew *Chronicle* compiled by Joseph ben Meir (born 1496, d. *c.* 1575), and published in 1554 at Sabionetta by Cornelius Adelkind, where, under the year of the Jewish era 5188 (=1428), the author mentions a book (without giving the title) printed at Venice and seen by him. Scriverius, being convinced that this could only refer to a book printed at Haarlem, applied the entry to a xylographic *Biblia Pauperum*, of which he gave a description, together with several other block-books and early printed books. (YY) In 1639 Boxhorn pushed the date of the Haarlem invention back to 1420, referring, as his authority, to the same *Chronicle* of Rabbi Joseph. Since that time the date of the Haarlem invention has been variously placed between 1420 and 1430.

Later testimonies are mere repetitions of earlier statements.[1] We need not say much about the story of Antonio Cambruzzi, who asserted that Pamfilo Castaldi invented printing at Feltre, in Italy, in 1456, and that Fausto Comesburgo, who lived in his house in order to learn the Italian language, learned the art from him and brought it to Mainz; this story, however, has found so much credence that in 1868 a statue was erected at Feltre in honor of Castaldi. Nor need we speak of Kuttenberg in Bohemia, where John Gutenberg is asserted to have been born and to have found the art of printing. We may also pass over Johann Fust, later on called Faust (testimonies P, T, DD, FF, II, KK, LL, OO), as we know from the Mainz lawsuit of 1455 (A) that he had simply assisted Gutenberg with loans of money. We may also pass over Johann Mentelin of Strasburg (testimonies NN, PP), only remarking here that he had already printed a Bible in 1460, and that he is mentioned in Strasburg registers as a chrysographer or gold-writer from 1447 to 1450; but of his whereabouts between 1450 and 1460 there is no record. That he had gone, or had been called, after 1450 by Gutenberg to Mainz has been asserted but not proved, and there is no reason why he should not be one of the two Johannes alluded to as the *prothocaragmatici* of Mainz in the Justinian of 1468 (testimony I). That Nicolas Jenson came to be regarded in certain circles and for a time as the inventor of printing is owing to testimony N being misunderstood. There remain, therefore, to be considered the testimonies which bear on the rival claims of Haarlem and Mainz. The controversy between Germany and Holland was publicly started as early as 1499 by the *Cologne Chronicle* (testimony BB), that between the two towns mentioned not publicly before 1561 (testimony RR); while no rival inventor to Gutenberg was mentioned publicly and in print earlier than 1588 (testimony VV).

Other claimants.

Let us first consider the claims of Germany and Mainz as centred in the person of Henne (=Hans or Johann) Gensfleisch, called Gutenberg or Gudenberg, the latter name derived from his mother, whose maiden name was Elsa Wyrich, who lived in the "Hof zum Gutenberg" at Mainz. He is supposed to have been born at that town about 1400. He is first mentioned in a Mainz document, dated 16th January, 1430. In a document of 28th March, 1430, he is spoken of as being "not in Mainz." Documents from 14th March, 1434, to 18th September, 1444, prove him to have been at Strasburg during that time, and documents dated respectively 17th October, 1448, 6th November, 1455, 21st June, 1457, 10th April, 1461, show that he was in or near Mainz on those days. By a decree of 17th January, 1465, the archbishop of that town rewarded him for "his services," and in the bond of Dr. Homery, dated 26th February, 1468, he is spoken of as dead. There are, moreover, six forged documents (including some relics of an ancient press bearing the date 1441) respectively dated 24th March, 1424, 1437, 3d July, 1453, 20th July, 1459, 19th June, 1463, and an entry in an anniversarium which has been applied to Gutenberg, but does not concern him (see Hessels, *Gutenberg*). Claims of Gutenberg.

In former years, when printing was believed to have been invented in 1440, the records of the Strasburg lawsuit of 1439, between Gutenberg and some Strasburg artisans about certain industrial undertakings (as the art of polishing stones, the manufacture of looking-glasses), were considered to prove the invention of printing at Strasburg, not, however, by Mentelin, as had been thought by some (testimonies NN, PP), but by Gutenberg. The records came to light about 1740, just when Schoepflin, the principal discoverer, had been commissioned to search for documents of this kind. Doubts may be suggested as to their genuineness, but they have all perished, partly during the revolution of 1793 and partly during the siege of Strasburg in 1870. However, nobody would now assert that printing was invented in 1439 or at Strasburg; and those who still believe that Gutenberg was the inventor of printing refer to them only as showing that he was a mechanic as early as 1439, and that he understood the art of pressing.[2]

The first document that connects Gutenberg with the art of printing is the notarial instrument of 6th November, 1455 (testimony A). But it says nothing of an invention or a new mode of printing. And yet the occasion was such as to make it almost imperative on Gutenberg to mention it, for he had spent 1600 guilders of Fust's money, apparently without printing anything,[3] and was on the point of being robbed by the latter and having taken away from him all that he had made and done to give effect to his idea or invention. In the next testimony (B), *i.e.*, the earliest Mainz books with printed dates (1457 to 1467), there is evidence that the new art of printing is not only not kept secret but fully appreciated at Mainz, and its importance fully realized and advertised; but, though they speak of a "nova ars imprimendi" and an "adinventio imprimendi," there is not a syllable as to a Mainz invention or inventor. In testimonies C and D (the *Catholicon* of 1460) there is again not one word about an invention or an inventor, or about Mainz. Yet Gutenberg is supposed to have printed the *Catholicon;* and it is incredible that he, who had been wronged and robbed by his two rivals (Fust and Schoeffer), should agree with them in explaining and proclaiming the new art, but never with one word assert his claim to the honor and profit of the invention, if he had made any, and should even omit his name, whereas he saw his two rivals never neglect to print their names in full on every book which they published. Those who believe that Gutenberg was the inventor of printing suggest that he kept silent, as otherwise his creditors would have seized his copies and his printing office. But this explanation cannot be accepted; for the verbose colophon at the end of a gigantic folio book

[1] Over a hundred of them have been collected by Ger. Meerman, *Origines Typogr.*, ii. p. 58 *sq.*

[2] See Hessels, *Gutenberg*, pp. 23, 185, etc.

[3] In line 42 Gutenberg distinctly declares that "he hoped that he was under no obligation to Fust to devote the first 800 guilders to the work of the books;" and, as Fust, by advancing the second 800 guilders in 1452, had become Gutenberg's partner, it seems clear that the former claimed in 1454, when the trial is calculated to have commenced, his money and interest because Gutenberg had as yet not printed anything.

like the *Catholicon*, published at a time when there were perhaps not more than three printing offices in the world, was calculated to draw attention to its printer and his residence, not to conceal him. Testimony F (1466) is no longer regarded as having any refereuce to Gutenberg or the invention of printing. H (1468) was formerly thought to mean: "I, the book, am cast (*i.e.*, its types are cast) in the Mainz city, and the house whence the type came (= where the type was invented) produced me." But of late years it has been shown that the author of the book, Johann Fons, was Peter Schoeffer's press-corrector. And, as he no doubt resided in Schoeffer's house, the two lines evidently mean: "I am a little book cast in Mainz, and I was born (= written) in the same house whence the type comes[1] (= where I am priuted)." Testimony I (also of 1468) speaks of two Johannes (Gutenberg and Fust) as the "protbocaragmatici librorum quos genuit urbs Moguntina." But this certainly means, uot that the first printers of books were born at Mainz, but that the two Jobannes were the chief printers of books (born) produced at Mainz.

When we now place together the clear documentary testimonies (A to I) of the first fourteen years of printing (1454 to 1468) at Mainz, we see that they all come from Mainz itself. Everybody conuected with the art speaks of it in the most public and unreserved manner; its importance is as fully realized and advertised during that period as it is in the present day; the German nation is even congratulated on possessing it; there is never any secrecy about it; once (about 1456) it is even called a new art. But, in the midst of all tbis publicity, the art which Mainz and Germany possess is never said to have been invented at Mainz. Tbe supposed Mainz inventor (Gutenberg) even speaks himself on two occasions (in the lawsuit of 1455 and in the *Catholicon* of 1460), but never says that he had made an invention. The archbishop, too, speaks publicly of Gutenberg in 1465 (testimony E), and rewards him for services, but does not speak of him as the inveutor of printing, nor even as a printer. Nor does Dr. Homery, in his letter to the arehbishop (testimouy G), in which he refers to Gutenberg's printing apparatus, call him the inventor of printing.

In 1468 we enter on a new phase in the history of the invention. Even if we reject testimony I as being merely local, testimony K (1468) speaks of the art of printing as having arisen in Germany. This testimony, however, does not come from Germany, nor from Mainz, but from Italy, and is supposed to owe its inspiration to the two German printers who had establisbed a printing office at Subiaco iu 1465, and in 1467 at Rome, and who most likely learned their craft at Mainz. But, as the two printers are mentioued in the testimony, and as it docs not speak of Gutenberg, nor of Mainz, it is far more likely that it was merely derived from the colophons of Fust and Schoeffer, or from sometbing that Cardinal Cusa had heard during his embassies in Germany. To the Mainz colophons we must also ascribe (*a*) the two testimonies of 1470 (L) and (*b*) the three of 1471 (M), all five of which come from France and Italy. At last, in 1472, we find in testimouy O the invention of priuting ascribed to Gutenberg of Mainz, but it is mentioned as a rumor, and comes from France. Guil. Fichet of Paris, wbo gives it, is supposed to have heard the rumor from the three German printers who commenced printing at Paris in 1470. But, as two of them had resided, immediately before they came to Paris, in the university of Basel, and are supposed to have learned their art there, the rumor is ascribed to "Bertolff von Hauauwe," who appears in the lawsuit of 1455 as Gutenberg's servant, and who was printiug at Basel in 1468. Perhaps it came rather from information which Fichet obtained from tbe St. Victor cathedral, near Maiuz, as he speaks of the art having been invented not far from that town. Testimony P (1474) again comes from Italy, from Rome, and was perhaps derived from one of tbe German printers settled there at that time. It merely speaks of Gutenberg, Fust, and Mentelin as printers, but says not a word which even touches upon the invention of the art. In testimony Q (1476) we have definite mention of Mainz as the inventress of tbe art; it is given as an addition to the Mainz colophon of 1468 (see I). In 1478 Maiuz is again mentioned in a Cologne testimony (R), which gives evideuce of research, as it is an amplification of an earlier one in which Mainz was not mentioned. Germany, Gutenberg, and Mainz are again mentioned in the Venetian testimony S (1483), which gives for the first time 1440 as the date of the invention. In the same year we have two earlier testimonies (P and N) worked into one (T), to the effect that printing was invented either by Gutenberg or by Fust or by Jenson. Testimony V (1492), which states that printing commenced at Mainz, is practically equivalent to Q. In 1494 and 1499 we have three German testimonies (X, Y, Z) as to Gutenberg being the inventor of printing; these, however, come, not from Mainz, but from Heidelberg. Z is given by a relative of Gutenberg, Adam Gelthus; and, as the latter resided at Heidelberg, it is clear tbat he was the real source of the other two Heidelberg testimonies (X and Y). Two years later, wheu Wimpheling, the author of testimony Y, had left Heidelberg, he ascribed (CC) the invention of printing to Strasburg, though stating that Gutenberg was the inventor. Testimony AA is recorded above to show the great confusion that reigned in people's minds about the invention. We must add to these testimonies those of 1504 (EE) and 1505 (FF), which are owing to Ivo Wittig, a relative of Gutenberg, and a canon and the keeper of the seals of the St. Victor cathedral, near Mainz, of which Gutenberg had been a lay member according to its *liber fraternitatis*. Thus in the period from 1468 to 1505 we have (1) several vague statements made in Italy and France as to the art of printing being known or practiced or invented in Germany, statements which arose from the books and colophons published at Mainz; (2) one item of rumor in 1472 that Gutenberg invented it near that town; (3) two Mainz statements, of 1476 and 1492, and one Cologne statement, of 1478, that it was invented at Mainz; (4) three German statements, of 1492, 1494, and 1499, that Gutenberg had invented it; and (5) two Mainz statements, of 1504 and 1505, to the same effect. It is to be particularly noticed that the statements (2, 4, 5) which speak distinctly of Gutenberg being the inventor can be clearly traced to Gutenberg himself and two of his relatives.

Seeing theu how slender the basis is for tbe tradition tbat printing was invented by Gutenberg at Mainz, and that even this slender basis was not laid till fourteen years after the art had been fully establisbed and proclaimed in that city, we cannot be surprised to find the tradition promptly contradicted. This contradiction was made in 1499 (testimony BB) in a *Chronicle* published at Cologne. To facilitate the understanding of tbis testimony it is divided above into eight sections. The first (taken from Hartmann Schedel's *Chronicle*, 1493), second, sixth, seventh, and eighth are no doubt due to the compiler of the *Chronicle*, and must not be connected with the third, fourth, and fifth, which, according to the compiler, are due to Ulrich Zell, a printer at Cologne, who bad probably settled tbere about 1463, and had most likely learned his art at Mainz, as he called himself "clericus Moguntinus." As Zell's testimony leaves to Gutenberg nothing but the honor of having perfected the art, various attempts have been made to explain away this account. As long as uo typographically printed *Donatus* had been found that could be fitted into Zell's account, it was argued that he meant *Donatuses* printed from wooden blocks; and this argument is brought forward even at tbe present time. But a practical printer like Zell must have been able to express himself to that effect if he had really meant to say so; and, as block-printing was not less practiced in Germany than in Holland, we could hardly assume that things printed in Holland would have inspired the German inventor rather than the same things printed in Germany. That testimony OO speaks of a *Donatus* printed from wooden blocks may be ascribed to the uotion arising at that time (*c.* 1533) that block-printing had given rise to typography. It has also been asserted that Holland in the *Chronicle* means Flauders; but the *Chronicle* is usually very correct in geographical matters. It has also been suggested that Zell most likely learned his art in Fust and Schoeffer's office and iuvented the passage to injure the reputation of Gutenberg, who had been their enemy. Finally it has been said that Zell did not suggest or write the passage at all; but it is hard to see how this can be maintained in face of the compiler's own statement to that effect. Tberefore, all these suggestions failing to weaken Zell's testimony, we must see how far it can be brought into harmouy with other circumstances and tbe testimouies MM, RR, SS, TT, VV, XX, YY, which claim tbe honor of the invention for Haarlem in Holland. Testimouies RR and SS do not mention the name of the inventor. But the former is a mere introduction destined for a complete book that was lost during the siege of Haarlem in 1573 before it was printed; we are, therefore, not entitled to say that Van Zureu did not know the name. SS may have omitted the name, because the publication of Van Zuren's work was iu contemplation at the time that it was written. That Guicciardini (testimony TT) in 1566 did not mention the name of the reputed Haarlem inventor cannot be considered as an indication that it was not known or had uot yet been "invented" when he wrote, as his accounts of the cities of the northern Netherlands are all very meagre and were for the most part derived from correspond-

Contradiction of Gutenberg's claims.

Lourens Coster's claims.

[1] Venit is the present not the perfect tense.

ence. In Junius's account (VV), however, we find every particular that could be desired. He begins by referring to the difficulty of vindicating the honor of the invention for Haarlem on account of the deep-rooted and general opinion that it took place at Mainz. He then mentions that Lourens (son of Jan) surnamed Coster resided at Haarlem "more than 128 years ago" and gives us to understand that in the year indicated by that phrase he invented the art of printing. As Junius's book was not published till after his death, in 1588, and the two prefaces in it are dated 1575 (he died 16th June, 1575), the number 128 is supposed to go back from the date when he actually wrote his account, which he is calculated to have done about 1568. Thus we get the year 1440 as the supposed date of the Haarlem invention, though, if we based our calculation upon the date of the preface, the year 1446 or 1447 would have to be assumed. But, as Junius adds that Coster's types were stolen by one of his servants, who fled with them to Mainz, and establishing there a printing office printed within a year's time, in 1442, two books, he must, if this latter date is correct, have meant 1440. By testimonies XX and YY we see that in the 17th century the date of the Haarlem invention was first put back as far as 1428, then to 1423; and since then it has usually been regarded as 1423, especially after it was discovered that the Haarlem wood where Coster is said to have cut his wooden letters was destroyed during a siege in 1426.

The researches as regards the reputed Haarlem inventor have hitherto not been made in a manner adequate for scientific purposes. It would appear that by the pushing back of the date of the invention, in spite of Junius, to 1420–1428, two inhabitants of Haarlem have been mixed up by the Dutch authors on the subject. (1) Lourens Janszoon, who never bore the surname Coster, and whose existence seems to be authenticated by documents from 1404 to 1439, was sheriff, and a wine merchant and innkeeper, and is supposed to have died in 1439. About 1870, however, researches brought to light that there had been (2) a Lourens Janszoon Coster at Haarlem, duly authenticated by genuine official documents as a chandler and innkeeper, from 1436 to 1483, who went away from Haarlem in the latter year. The name of this man and some genealogical particulars known of him fit into the story of Junius, though there are certain particulars in Junius's account which cannot yet be properly explained.

Junius bases his account of the Haarlem invention on three books, a Dutch edition of the *Speculum Humanæ Salvationis*, the *Doctrinale*, and the *Tracts* of Petrus Hispanus (Pope John XXI.). The first work, he said, was printed by Coster himself as a first specimen of his art, and it would seem from his words that he considered the work to be printed with wooden types. The two Dutch editions of the *Speculum*, however, were printed, like the two Latin editions of the same work, with movable metal type, though in one of the Latin editions there are twenty leaves the text of which is printed apparently from wooden blocks. The *Doctrinale* and the *Tracts* of Hispanus were printed, Junius says, at Mainz by Coster's workman with the types which he had stolen from Coster. Of the Hispanus *Tracts* no edition has yet come to light that would answer to Junius's description. But of the *Doctrinale* we have four editions, all printed in the same type (i.) as the four editions of the *Speculum*. With these same types are printed no less than six editions of the short Latin grammar of Ælius Donatus; and editions of this school-book printed in Holland were, according to Zell in the *Cologne Chronicle*, the models for the printing at Mainz, which commenced about 1450. As there are no other editions of Donatus printed in Holland that could be placed before the year 1450, the claims of Haarlem and Holland are based on them; and we will, therefore, briefly describe the types and books which must be connected with the *Specula*, *Doctrinalia*, and *Donatuses* just mentioned. In one of the editions of the *Speculum* in Dutch occur two leaves printed in a different type (ii.) from the rest of the work. This type is in its turn so very much like another type with which a work of Laur. Valla (*Facetiæ Morales*) is printed that we link it (iii.) on to the two just mentioned. Then again type iii. is, in some of its capitals, identical with a type (iv.) used for a work of Ludovicus de Roma, *Singularia Juris*, at the end of which, on the last leaf, commences another work, printed in a different type (v.). Type vi. is identical with type v., except in its capital P, which is larger. We have also works printed in two different types (vii., viii.) which both show such a great family likeness to each other and to types i. to vi. that it would not be advisable to separate them without evidence that they do not belong to the same office. With these eight types, which we cannot at present separate, forty-seven different books were printed, so far as we know at present. In type i.: four editions (two in Latin,[1] two in Dutch) of the *Speculum Humanæ Salvationis*, a work which consists of woodcuts with explanatory text underneath; a Dutch version of *The Seven Penitential Psalms;* one *Donatus* of 27 lines; two editions of *Donatus* of 28 lines; a *Liturgical Book* in 16mo; three editions of *Donatus* of 30 lines; one *Donatus*, in French, of 29 and 30 lines on a page; four editions of *Doctrinale* of 32 lines; one *Catonis Disticha* of 21 lines. In type ii.: two leaves only (49 and 60) of one of the Dutch editions of the *Speculum*. In type iii.—Laurentius Valla, *Facetiæ Morales*, etc. In type iv.: four editions of *Donatus* of 24 lines; Lud. (Pontanus) de Roma, *Singularia Juris;* Lud. (Pontanus) de Roma (?), *Treatise on Canonical Law* (?). In type v.: Pius II., *Tractatus et Epitaphia* (printed at the end of the *Singularia Juris*); Guil. de Saliceto, *De Salute Corporis;* one *Donatus* of 26 lines; five editions of *Donatus* of 27 lines; one *Doctrinale* of 26 lines; one *Doctrinale* of 28 lines; one *Doctrinale* of 29 lines; one *Doctrinale* of 32 lines; *Catonis Disticha;* Guil. de Saliceto, *De Salute Corporis*, together with Turrecremata, *De Salute Animæ;* Pius II., *Tractatus de Amore*, etc.; Pindar of Thebes, *Iliados Homericæ Epitome, cum Præfatione Pii II.;* another edition of the same work. In type vi.: one *Donatus* of 26 lines; one *Donatus* of 27 lines. In type vii.: one *Donatus* of 27 lines. In type viii.: an *Abecedarium* of two leaves and a *Donatus* of 31 lines.[2]

Early Dutch types.

Type v. must have been in existence before 13th September, 1474, as there is evidence that a copy of the *Saliceto*, printed in that type, was bought for the monastery of St. James at Lille by its abbot Conrad du Moulin, who filled that office from the end of 1471 to 13th September, 1474. As a work in this type (the *Tracts and Epitaphs* of Pius II.) is printed at the end of the *Singularia Juris* in type iv., we may assume that this type existed a considerable time before type v. As the books printed in types iv. and v. show greater progress in style and workmanship than the books printed in types i. to iii., we must assign the latter to an earlier period than the former. There is indeed positive evidence that type i. must have existed a considerable time before the end of 1473, as fragments of a *Donatus* printed in that type were used by a bookbinder at Haarlem to strengthen the binding of an account-book of the cathedral church in that town for the year 1474. From these facts alone we may safely assume that none of the forty-seven books can be dated after 1474, or, if any, only a few in types v. and vii. On the other hand, four of the works in type v. cannot be dated before 1458, as they bear the name of Pius II., who was not elected pope till that year. When we consider that there are twenty different editions of the *Donatus* printed in these types, and place an interval of about eighteen months between the successive editions, we get a period of some thirty years from about 1445 to 1474 for the issue of the twenty editions. That we reach the year 1445 by such a calculation is purely accidental; but there is evidence that in 1446 and 1451 printed[3] *Doctrinalia* were bought at Bruges and Valenciennes by Jean Le Robert, the abbot of Cambray, according to two entries in his diary, preserved in the archives at Lille. And, as we know positively that there was no printing done at Mainz before 1454, nor anywhere else so early, we can only apply these entries to the *Doctrinalia* printed in Holland in the same types as the four editions of the *Speculum* (on which Junius based the tradition of the Haarlem invention), and six editions of the Donatus, which we may fit into Zell's account. That the editions of the *Speculum*, of the *Donatus*, and of the *Doctrinale* in type i. may be dated as early as 1445–1454 is clear when we compare them with the earliest products of Mainz printing, for which the *Donatuses*, according to the *Cologne Chronicle*, served as models. For instance, no difference in workmanship can be detected between the *Donatuses* printed in Holland and the three editions of *Donatus* in the 36-line Bible type and the four editions of the same in the 42-line Bible type, all seven presumably printed at Mainz and before 1456. Nor is the workmanship of the *Specula* (in type i.) or of the *Facetiæ Morales* (in type iii.) different from or later than that of the Mainz *Catholicon* of 1460.

It has been pointed out above that the first products of the art of printing were not meant to be anything but faithful imitations of manuscript books, and that no material deviations from the general plan become observable till about 1473–1477. Nowhere is the plan of the MS. period more strictly adhered to than in the forty-seven books of

[1] Twenty leaves of one of the Latin editions are apparently printed from wooden blocks, the text as well as the engravings.

[2] For a detailed list of these books, and further particulars regarding them, see J. H. Hessels, *Haarlem, the Birthplace of Printing*, London, 1887, p. 25 *sq.*

[3] The abbot speaks of *Doctrinalia* "gette" or "jettez en molle," and the phrase is, as Bernard (*Origine*, i. 97 *sq.*) shows by eight examples from 1474—the year when printing is first officially spoken of in France—to 1593, and down to the present day, applied to typographically-printed books only.

which we are speaking. They are all without signatures, without initial directors, without hyphens, without catch-words, that is to say, without any of those characteristics which we see gradually, one after the other, come into almost general use from 1473 (if not earlier) to 1480. The four editions of the *Speculum* are all entirely printed anopisthographically, the woodcuts at the top of the pages as well as the explanatory text (in type i.) underneath, which would hardly be the case if the books had been printed after 1471, when the printing of woodcuts, together with text in movable types, had already been known for eleven years. Their types have nothing in common with any of those used in the Netherlands after 1473, but remind us in every respect of the earlier period of the Dutch block-books and MSS. They are all, so far as we know, without any colophon (except such a word as *explicit*), which would, for a collection of forty-seven books, be incompatible with a period after 1471, but not with the earlier period of the block-books and MSS. Moreover, out of the forty-seven books no less than thirty-five are printed on vellum, which is incompatible with a period after 1471, when printing on paper had become universal, but not with the earlier period of the MSS.

Invention at Haarlem by Coster.

There is, therefore, no reason whatever to discredit Zell's statement in the *Cologne Chronicle* of 1499, that the *Donatuses* printed in Holland were the models, the "beginning" of the art of printing, at Mainz, that of Hadrianus Junius in his *Batavia*, that printing was invented at Haarlem by Lourens Janszoon Coster. The two statements were made independently of each other. That of Zell must be regarded as a direct contradiction of the vague rumors and statements about an invention of printing at Mainz in Germany by Gutenberg, which gradually crept into print in and after 1468 in Italy and France, and which found their way into Germany about 1476, after Mainz and Germany had given the greatest publicity to the existence of the art in their midst for more than twenty-two years, but had been silent about an invention and an inventor. And, though Zell accords to Mainz the honor of having improved the art and having made it more artistic, he denies it the honor of having invented or begun it, and this latter honor was never claimed by that town before 1476. Junius's account is the embodiment of a local tradition at Haarlem, the first written traces of which we have in a pedigree (testimony MM) of the family of the reputed Haarlem inventor, which must have existed at least as early as 1520. His account has been indirectly confirmed by the finding of several fragments at Haarlem, all belonging to the groups of books mentioned above, but still more by the discovery of several fragments of the *Donatuses* printed in the *Speculum* type, all used as binder's waste by Cornelis, the bookbinder, the very man whom Junius alleges to have been the servant of Coster. As the case stands at present, therefore, we have no choice but to say that the invention of printing with movable metal types took place at Haarlem about the year 1445 by Lourens Janszoon Coster.

Early Types and their Fabrication.

We must now take notice of two theories or traditions which have been current for a long time as to some intervening stage between the art of block-printing and the art of printing with movable cast types.[1] One theory or tradition would have it that the inventor of printing, after the idea of single, individual, movable types had arisen in his mind, practiced his new invention for some considerable time with wooden types, and that he came only gradually to the idea of movable types cast of metal.

Wooden types.

Junius gives us to understand that in his opinion the Dutch *Speculum* was printed with such wooden types. Of Johann Gutenberg it was asserted that he printed his first Bible with wooden types. The Mainz psalter, printed in 1457 by Joh. Fust and Peter Schoeffer, was alleged to have been printed with wooden types, in which case the 4th edition, published in 1502, and even the 5th edition of 1516, would be printed with wooden types, the same being used for them as for the editions of 1457 and 1459. Theod. Bibliander was the first to speak (in 1548) of such types and to describe them: first they cut their letters, he says, on wood-blocks the size of an entire page; but, because the labor and cost of that way was so great, they devised movable wooden types, perforated and joined one to the other by a thread.[2] Bibliander does not say that he had ever seen such types himself, but Dan. Speckle or Specklin (died 1589), who ascribed the invention to Mentelin, asserts that he saw some of these wooden types at Strasburg.[3] Angelo Roccha asserted in 1591 that he had seen at Venice types perforated and joined one to the other by a thread, but he does not say whether they were of wood or of metal.[4] In 1710 Paulus Pater asserted that he had seen wooden types made of the trunk of a box-tree, and perforated in the centre to enable them to be joined together by a thread, originating from the office of Fust at Mainz.[5] Bodman, as late as 1781, saw the same types in a worm-eaten condition at Mainz; and Fischer stated in 1802 that these relics were used as a sort of token of honor to be bestowed on worthy apprentices on the occasion of their finishing their term.

Besides those who believed in these wooden types from the fact that the letters (especially in the *Speculum*) vary among themselves in a manner which would not be the case had they been cast from a matrix in a mould, there were authors and practical printers who attempted to cut themselves or to have cut for them some such wooden types as were alleged to have been used by the early printers. Some of them came to the conclusion that such a process would be quite practicable; others found by experiment that it would, in the case of small types be wholly impossible. Up to the present time no book or document has come to light which can be asserted to have been printed with such single, movable, wooden types. But nearly all the experiments to which we have alluded were made with the idea that the inventor of printing, or the earliest printers, started, or had to start, with as large a supply of type as a modern printer. This idea is erroneous, as it is hardly any longer denied that, for a good many years after the first appearance of the art, printers printed their books (large or small) not by quires (quaternions or quinternions) but page by page.[6] Therefore, all considerations of the experimenters as to the impracticability of such wooden types, on account of the trouble and length of time required for the cutting of thousands of types, fall to the ground in face of the fact that the earliest printers required only a very small quantity of type, in spite of the peculiar forms (combined letters, letters with contractions, etc.) which were then in vogue.

Sculpto-fusi types.

The other theory would have it that between block-printing and printing with movable cast types there was an intermediate stage of printing with "sculpto-fusi" types, that is, types of which the shanks had been cast in a quadrilateral mould, and the "faces," *i.e.*, the characters or letters, engraved by hand afterwards. This theory was suggested by some who could not believe in wooden types and yet wished to account for the marked irregularities in the types of the earliest printed books.

Gerardus Meerman, the chief champion of this theory, based it, not only on the words of Celtes (*Amores*, iii. 3), who in 1502 described Mainz as the city "qnæ prima sculpsit solidos ære characteres," but on the frequent recurrence of the word *sculptus* in the colophons of the early printers (for Jenson and Husner of Strasburg, see p. 724 above). Sensenschmid in 1475 said that the *Codex Justinianus* was "cut" (*insculptus*), and that he had "cut" (*sculpsit*) the work of Lombardus, *In Psalterium*. Meermau also explained the account of the invention of priuting by Trithemius[7] as meaning that, after the rejection of the first wooden types, the inventors discovered a method of casting the bodies only of all the letters of the Latin alphabet from what they called matrices, on which they cut the face of each letter; and from the same kind of matrices a method was in time discovered of casting the complete letters of sufficient hardness for the pressure they had to bear, which letters they were before—that is, when the bodies only were cast—obliged to cut.[8] In this way Meerman explained that the

[1] We do not allude to Tritheim's assertion that the *Catholicon* of 1460 was printed from wooden blocks; for this story, which he declares he had heard from Peter Schoeffer, if it were true, would belong to the history of block-printing. Nor need we speak of Bergellanus's verses (1541), in which he distinctly alludes to carved blocks.

Speculum was printed in sculpto-fusi types, although in the one page of which he gives a fac-simile there are nearly 1700 separate types of which 250 alone are e's. Schoepflin claimed the same invention for Strasburg, and believed that all the earliest books printed there were produced by this means. Both Meerman and Schoepflin agreed that engraved metal types (*literæ in ære sculptæ*) were in use for many years after the invention of the punch and matrix, mentioning among others so printed the Mainz psalter, the *Catholicon* of 1460, the Eggestein *Bible* of 1468, and even the *Præceptorium* of Nider, printed at Strasburg in 1476. But the great difficulty connected with the process of first casting the shanks and afterwards engraving the faces of the types has become apparent to those who have made experiments; and it seems more probable that the terms *sculpere, exsculpere, insculpere* are only a figurative allusion to the first process towards producing the types, namely, the cutting of the punch, which is artistically more important to the fabrication of types than the mechanical casting,—all the more as Schoeffer in 1468 makes his *Grammatica Vetus Rhythmica* say, "I am cast at Mainz," an expression which could hardly be anything but a figurative allusion to the casting of the types.

Types cast in sand.

Granting that all the earlier works of typography preserved to us are impressions of cast-metal types, there are still differences of opinion, especially among practical printers, as to the probable methods employed to cast them. It is considered unlikely that the inventor of printing passed all at once to the perfect typography of the punch, the matrix, and the mould. Bernard[1] considered that the types of the *Speculum* were cast in sand, as that art was certainly known to the silversmiths and trinket-makers of the 15th century; and he accounts for the varieties observable in the shapes of various letters on the ground that several models would probably be made of each letter, and that the types, when cast by this imperfect mode, would require some touching up or finishing by hand. He exhibits a specimen of a word cast for him by this process which not only proves the possibility of casting types in this manner but also shows the same kind of irregularities as those observable in the types of the *Speculum*.

But here again it is argued that in types cast by this or any other primitive method there would be an absence of uniformity in what founders term "height to paper." Some types would stand higher than others, and the low ones, unless raised, would miss the ink and not appear in the impression. The comparative rarity of faults of this kind in the *Speculum* leads one to suppose that, if a process of sand-casting had been adopted, the difficulty of uneven heights had been surmounted either by locking up the form face downwards, or by perforating the types either at the time of casting or afterwards, and holding them in their places by means of a thread or wire. To this cause Ottley attributed the numerous misprints in the *Speculum*, to correct which would have involved the unthreading of every line in which an error occurred. And, as a still more striking proof that the lines were put into the form one by one, in a piece, he shows a curious printer's blunder at the end of one page, where the whole of the last reference-line is put in upside down, thus:

Noe vuas bespot slapende ende niet vuetende.
Genesis ix capitel.

A "turn" of this magnitude could hardly have occurred if the letters had been set in the form type by type.

Types cast in clay moulds.

Another suggested mode is that of casting in clay moulds, by a method very similar to that used in the sand process, and resulting in similar peculiarities and variations in the types.

Ottley, who was the chief exponent of this theory, suggested that the types were made by pouring melted lead or other soft metal into moulds of earth or plaster, after the ordinary manner used from time immemorial in casting statues of bronze and other articles of metal. But the mould thus formed could hardly avail for a second casting, as it would be scarcely possible to extract the type after casting without breaking the clay, and, even if that could be done, the shrinking of the metal in cooling would be apt to warp the mould beyond the possibility of further use. Ottley therefore suggests that the constant renewal of the moulds could be effected by using old types cast out of them, after being touched up by the graver, as models,—a process which he thinks will account for the varieties observable in the different letters, but which would really cause such a gradual deterioration and attenuation in the type, as the work of casting progressed, that in the end it would leave the face of the letter unrecognizable as that with which it began. It would therefore be more reasonable to suppose that one set of models would be used for the preparation of all the moulds necessary for the casting of a sufficient number of types to compose a page, and for the periodical renewal of the moulds all through the work, and that the variations in the types would be due, not to the gradual paring of the faces of the models, but to the different skill and exactness with which the successive moulds would be taken. It is evident that the sand and clay methods of casting types above described must be slow. The time occupied after the first engraving of the models in forming, drying, and clearing the moulds, in casting, extracting, touching up, and possibly perforating the types required for one page, would exceed the time required by a practiced xylographer for the cutting of a page of text upon a block. But he that has gone through the trouble of casting separate movable types has a clear gain over the wood-block printer in having a font of movable types, which, even if the metal in which they were cast were only soft lead or pewter, might be used again and again in the production of any other page of text, while the wood-block can only produce the one page which it contains. Moreover, only one hand could labor on the xylographic block; but many hands could be employed in the moulding and casting of types, however rude they might be. Bernard states that the artist who produced for him the few sand-cast types shown in his work assured him that a workman could easily produce a thousand such letters a day. He also states that, though each letter required squaring after casting, there was no need to touch up the faces.

Polytype.

There remains yet another suggestion as to the method in which the types of the rude school may have been produced. This may be described as a system of what the founders of sixty years ago called polytype, which is a cast or fac-simile copy of an engraved block, matter in type, etc.

Lambinet,[2] who is responsible for the suggestion, based upon a new translation of Trithemius's narrative, explains that this process really means an early adoption of stereotype. He thinks that the first printers may have discovered a way of moulding a page of some work—an *Abecedarium*—in cooling metal, so as to get a matrix-plate impression of the whole page. Upon this matrix they would pour a liquid metal, and by the aid of a roller or cylinder press the fused matter evenly, so as to make it penetrate into all the hollows and corners of the letters. This tablet of tin or lead, being easily lifted and detached from the matrix, would then appear as a surface of metal in which the letters of the alphabet stood out reversed and in relief. These letters could easily be detached and rendered mobile by a knife or other sharp instrument, and the operation could be repeated a hundred times a day. The metal faces so produced would be fixed on wooden shanks, type high, and the font would then be complete. Lambinet's hypothesis was endorsed by Firmin-Didot, the renowned type-founder and printer of Lambinet's day. But it is impossible to suppose that the Mainz psalter of 1457, which these writers point to as a specimen of this mode of execution, is the impression, not of type at all, but of a collection of "casts" mounted on wood.

Shape of earliest type.

Whatever value there may be in the above theories with regard to the movable types of the first printer, certain it is that the shape and manufacture of the types used as early as *c.* 1470 do not seem to have differed materially from those of the present types.

This is evident (1) from the shape of the old types which were discovered in 1878 in the bed of the river Saône, near Lyons, opposite the site of one of the 15th-century printing houses of that city, and which there is reason to believe belonged once to one of those presses, and were used by the early printers of Lyons; (2) from a page in Joh. Nider's *Lepra Moralis*, printed by Conrad Homburch at Cologne in

[1] *Origine de l'Imprimerie*, i. 40.

[2] *Origine de l'Imprimerie*, Paris, 1810, 2 vols. 8vo, i. 97.

1476, which shows the accidental impression of a type, pulled up from its place in the course of printing by the ink-ball, and laid at length upon the face of the form, thus leaving its exact profile indented upon the page; (3) from an entirely similar page (fol. 4[b]) in *Liber de Laudibus ac Festis Gloriosæ Virginis*, Cologne, *c.* 1468. From the small circle appearing in the two last-mentioned types, it is presumed that the letters were pierced laterally by a circular hole, which did not penetrate the whole thickness of the letter, and served, like the nick of modern types, to enable the compositor to tell by touch which way to set the letter in his stick. The fact that in these two cases the letter was pulled up from the form seems to show that the line could not have been threaded.

Vinc. Fineschi, *Notizie Storiche sopra la Stamperia di Ripoli* (Florence, 1781, p. 49), gives an extract from the cost-book of the Ripoli press, about 1480, by which it appears that steel, brass, copper, tin, lead, and iron wire were all used in the manufacture of types at that period.[1]

History of the earliest types.

The history and nomenclature of the earliest types are practically a continuation of the history and nomenclature of the characters figured in the earliest block-books, wood-engravings, and MSS. For instance, Gothic type was first seen about the year 1445; but it should not be forgotten that the Gothic writing, of which that type was an imitation, was already known and used about the second half of the 12th century. Again, the pure Roman type, which appeared about 1464, is nothing but an imitation of what in palæography is called the Caroline minuscule, a handwriting which was already fully developed towards the end of the 8th century. Consequently, details as to the history and development of the various types properly belong to the study of PALÆOGRAPHY (*q.v.*).

The broad outlines of the history of the earliest types are as follows:

Gothic.

Gothic type, of the angular or pointed kind, was first used by the Haarlem printer of the *Speculum*, *Donatus*, etc. (see specimen No. 1, taken from the British Museum copy of the *Speculum Humanæ Salvationis*, mixed Latin edition), presumably *c.* 1445. An entirely similar but larger type (No. 2, taken from the British Museum copy of Ludovicus [Pontanus] de Roma, *Singularia*) was used, presumably by the same printer, *c.* 1465–1470. Gothic type appeared in Germany as a church type in 1454, in the 31-line indulgence, presumably printed by Johan Gutenberg at Mainz (No. 3, from the Göttingen copy), and in the 30-line indulgence (No. 4, taken from the British Museum copy), printed by Peter Schoeffer at Mainz. Type No. 3 was also used about the same time for the 36-line Bible and type No. 4 for the 42-line Bible. Two much larger Gothic types appeared in the psalter of 1457, published by Fust and Schoeffer (see Bernard, *Origine*, pl. vii.). In Italy Gothic type appears in 1468 (No. 5, taken from the British Museum copy of Cicero, *De Oratore*, published at Rome by Ulr. Hahn, 15th December, 1468, in small Roman type, with imprint in Gothic), but in a more rounded form; it is practically the ordinary Italian writing influenced by the Gothic. In France Gothic began to be used in 1473; in England it appears first in Caxton's type about the year 1480.[2] It was employed extensively in a great many of the earliest presses all over Europe, and continued to be used largely at all times, especially for Bibles, law books, royal proclamations, etc., and even to this day it is the national character of Germany. It is now usually called *lettre de forme*, *black letter* or *Old English* in English-speaking countries, *lettre Flamand* in Holland, and *fractur* in Germany.

Bastard Italian or Roman.

Bastard Italian or bastard Roman was introduced in 1454 at Mainz in the 31-line (No. 6) and 30-line (No. 7) indulgence. It is also called *lettre de somme*, some think from the *Summa* of Thomas Aquinas, printed in the type of the Bible of 1462 by Fust and Schoeffer. Varieties of this kind of type were, like the Gothic, much used by the earliest printers, as, for instance, the printer of the 1460 *Catholicon*, *i.e.*, by Mentelin of Strasburg, *c.* 1460, and by Ulrich Zell at Cologne, *c.* 1466, etc. In England it appeared in the first three books printed (1478, 1479) at Oxford (No. 8, taken from the British Museum copy of Jerome's *Expositio in Simbolum Apostolorum*, wrongly dated 1468 for 1478).

No. 13.—Aug. Dactus, *Elegancie*, 1479.

Roman.

Roman type, the Caroline minuscule of palæography, was first used in Germany about 1464, at Strasburg, by the printer whose font of type is known by a peculiarly shaped R, and who on that account is usually called "the R printer" (No. 9, taken from the British Museum copy of Durandus, *Rationale*, of which the Basel library possesses a copy which was bought in 1464).[3] In Italy it appears in 1465 at Subiaco (see Bernard, pl. xii., No. 19), at Rome in 1467 (*op. cit.*, pl. xii., No. 20), but in all its purity at Venice in 1469, used by Johannes of Spires (*op. cit.*, pl. xii., No. 23), and at Paris in 1470 (*op. cit.*, pl. xiii., No. 25). In England it was not used before 1518, when Richard Pynson printed Pace's *Oratio in Pace Nuperrima* (see facsimile in Reed's *Type Foundries*, p. 92).

[1] On the above theories and types consult T. B. Reed, *Old English Letter Foundries*, pp. 3–26.

[2] See Blades, *Life of Caxton*, pl. xvii.

[3] See Jules Philippe, *L'Imprimerie à Paris*, p. 219.

Burgundian type, or *gros batarde* or *secretary*, was first used about 1470–72 by Colard Mansion at Bruges (No. 10, taken from the British Museum copy of *La Controversie de Noblesse*, c. 1471–72). With a somewhat similar type (No. 11, taken from the British Museum copy of the *Recuyell*) William Caxton is presumed to have printed, likewise at Bruges, a set of five books, of which the *Recuyell of the History of Troye*, a translation of a work by Raoul le Fèvre, is the best known and was probably printed c. 1471.[1] To this same class belong the first type (No. 12, from the British Museum copy of the *Dictes* used in England by William Caxton for the printing of *Dictes and Sayings of the Philosophers* 18th November, 1477), and that used by the printer of St. Albans (No. 13, taken from the Cambridge university library copy of Aug. Dactus, *Elegancie*). It was an imitation of the manuscript hand of the English and Burgundian scribes of the 15th century, and, after having figured for a long time in several of the early London and provincial presses, was about 1534 entirely superseded by the English black letter. To this class of type belong also the later *lettre de civilité* (c. 1570), the *script* (*lettre coulée*, *lettre de finance*, Dutch *geschreven schrift*), *set court*, *base secretary*, and *running secretary* types. Burgundian.

On the types before 1500, consult also the facsimiles in Holtrop's *Mon. Typ. des Pays-Bas*, The Hague, 1868: R. C. Hawkins, *First Books and Printers of the Fifteenth Century*, New York, 1884; William Blades, *The Life of Caxton*, London, 1861–63; Bernard, *Origine de l'Imprimerie*, Paris, 1853, vol. i., plates iii.-xiii.; Placidus Braun, *Notitia de Libris ab Artis Typogr. Inventione usque ad Annum* 1479 *Impressis*, Augsburg, 1788; H. Noel Humphreys, *Hist. of the Art of Printing*, fol., London, 1867. The types after 1500 can best be learned from the catalogues of type-founders, among which those of Messrs. Enschedé, of Haarlem, occupy a foremost place. Of others we may mention—*Indice dei Caratteri nella Stampa Vaticana*, 4to, Rome, 1628: *Épreuves des Caractères qui se trouvent chez Claude Lameste*, 4to, Paris, 1742; *Épreuves des Car. de la Fonderie de Claude Mozet*, 8vo, Nantes, 1754; *Les Car. de l'Imprimerie par Fournier le Jeune*, 8vo, Paris, 1764; *Proef van Letteren, Bloemen*, etc., *van Ploos van Amstel*, 8vo, Amsterdam, 1767; *Épreuve de Car. de Jacques François Rosart*, 8vo, Brussels, 1771; *Schriften . . . bey J. H. Prentzler*, 4to, Frankfort-on-Main, 1774; *Épreuves des Car. de la Fond. de J. L. Joannis*, 8vo, Paris 1776; *Épreuves des Car. de la Fond. de J. L. de Boubers*, 8vo, Brussels, 1777; *Proeve van Letteren welke gegooten worden door J. de Groot*, 8vo, The Hague, 1787; *Pantographie*, by Edmund Fry, 8vo, London, 1799; and *Manuale Typographico*, by G. Bodoni, 4to, Parma, 1818.

Subsequent to 1500.

Though the *Cologne Chronicle* of 1499 denies to Mainz the honor of the invention of the art of printing, it was right in asserting that, after it had been brought there from Holland, it became much more masterly and exact, and more and more artistic. During the first half century of printing a good many printers distinguished themselves by the beauty, excellence, and literary value of their productions. We may mention as such: Johan Fust and Peter Schoeffer at Mainz; Johan Mentelin and Heinrich Eggestein at Strasburg; Ulrich Zell at Cologne; Sweynheym and Pannarts at Subiaco and at Rome; Nicolas Jenson at Venice; Anton Koberger at Nuremberg; Ketelaer and De Leempt at Utrecht; Johan Veldener at Louvain, Utrecht, and Kuilenburg; Gerard Leeu at Gouda; Johan of Westphalia at Louvain; and William Caxton (*q.v.*) at Westminster. Printers after 1500.

Very soon the demand for books increased, and with it came a reduction in their prices. This caused a decline in the execution of printing, which begins to be appreciable about 1480 in some localities, and may be said to have become general towards the end of the 15th century. At all times, however, we find some printers raise their art to a great height by the beauty of their types and the literary excellence of their productions. Among the later printers we may mention the Aldi of Venice (1490 to 1597; see Manutius, vol. xv. p. 519); G. B. Bodoni of Parma (1768–1813; see vol. iii. p. 738); John Amerbach at Basel (1492–1516); John Froben at Basel (1496–1527; see vol. ix. p. 694); John Baskerville at Birmingham (1750–1775; see vol. iii. p. 364); the house of Wechel, first at Paris (c. 1530–1572), afterwards at Frankfort; Christopher Plantin at Antwerp (1554–1589), but continued long after under the firm *Officina Plantiniana* (see vol. xix. p. 187); the Elzevirs, first at Leyden, afterwards at Amsterdam (1580–1680; see vol. viii. p. 145); Antoine Verard at Paris (1485–1513); Josse Bade at Paris (1495–1535; see Badius, vol. iii. p. 196); and the Estiennes at Paris (1502–1598; see Stephens, vol. xxii. p. 561).

[1] Cf. Blades, *Life of Caxton*.

History of Modern Types.

The Italic type[2] is said to be an imitation of the handwriting of Petrarch, and was introduced by Aldus Manutius of Venice for the purpose of printing his projected small editions of the classics. The cutting of it was entrusted to Francesco da Bologna, an artist who is presumed to be identical with the painter Francesco Francia or Raibolini. The font is a "lower case" only, the capitals being Roman in form. It contains a large number of tied letters, to imitate handwriting, but is quite free from contractions and ligatures. It was first used in the *Virgil* of 1500. Aldus produced six different sizes between 1501 and 1558. It was counterfeited almost immediately in Italy, at Lyons, and elsewhere. Originally it was called Venetian or Aldine, but subsequently Italic type, except in Germany and Holland, where it is called "cursive." The Italians also adopted the Latin name "characteres cursivi seu cancellarii." In England it was first used by Wynkyn de Worde in Wakefield's *Oratio* in 1524. The character was at first intended and used for the entire text of classical works. When it became more general, it was employed to distinguish portions of a book not properly belonging to the work, such as introductions, prefaces, indexes, notes, the text itself being in Roman. Later it was used in the text for quotations, and finally served the double part of emphasizing certain words in some works, and in others, chiefly translations of the Bible, of marking words not rightly forming a part of the text. Italic.

Greek type (*minuscules*) first occurs in Cicero, *De Officiis* printed at Mainz in 1465 by Fust and Schoeffer. The font used is rude and imperfect, many of the letters being ordinary Latin. In the same year Sweynheym and Pannarts used a good Greek letter for some of the quotations in their edition of *Lactantius* (see, for instance, leaves 11a, 19a, 36a, 139, 140); but the supply was evidently short at first, as some of the larger quotations in the first part of the book were left blank to be filled in by hand. The first book wholly printed in Greek minuscules was the *Grammar* of Lascaris, by Paravisinus, at Milan in 1476, in types stated to have been cut and cast by Demetrius of Crete. The font contains breathings, accents, and some ligatures. The headings to the chapters are wholly in capitals. The *Anthologia Græca* of Lascaris was printed at Florence in 1494 wholly in Greek capitals (*litteræ majusculæ*), and it is stated in the preface that they were designed after the genuine models of antiquity to be found in the inscriptions on medals, marbles, etc. But as late as 1493 Greek type was not common, for in that year the Venice printer Symon Bevilaqua issued *Tibullus*, *Catullus*, and *Propertius* with blanks left in the commentary for the Greek quotations. In England Greek letters appeared for the first time in 1519 in W. de Worde's edition of Whitenton's *Grammatica*, where a few words are introduced cut in wood. Cast types were used at Cambridge in Galen's *De Temperamentis*, translated by Linacre, and printed by Siberch in 1521, who styles himself the first Greek printer in England; but the quotations in the Galen are very sparse, and Siberch is not known to have printed any entire book in Greek. The first printer who possessed Greek types in any quantity was Reginald Wolfe, who held a royal patent as printer in Greek, Latin, and Hebrew, and printed in 1543 two *Homilies* of Chrysostom, edited by Sir John Cheke, the first Greek lecturer at Cambridge. In Edinburgh, in 1563, and as late as 1579, the space for Greek words was left blank in printing, to be filled in by hand. In 1632 Cambridge applied to Oxford for the loan of a Greek font to print a Greek Testament, and the same university made an offer in 1700 for the purchase of a font of the king's Greek at Paris, but withdrew on the French Academy insisting as a condition that every work printed should bear the imprint "characteribus Græcis e typographeo regio Parisiensi." It should not be forgotten that the large number of ligatures in the Greek of that day made the production of a font a serious business. The Oxford Augustin Greek comprised no fewer than 354 matrices, the great primer 456, and even one font showed 776 different sorts. The Dutch founders effected a gradual reduction of the Greek typographical ligatures. Early in the 19th century a new fashion of Greek, for which Porson was sponsor and Greek.

[2] These paragraphs on the various types are for the most part taken from T. B. Reed's *History of the Old English Letter Foundries*, London, 1887, p. 50 *sq.*

furnished the drawings, was introduced, and has remained the prevailing form to this day.

The first Hebrew types are generally supposed to have appeared in 1475 in Petrus Niger's *Tractatus contra Perfidos Judæos* (leaf 10), printed by Conrad Fyner at Esslingen. De Rossi states that a Hebrew work in four folio volumes entitled *Arba Turim* of Rabbi Jacob ben Asher, was printed in 1475 at Pieve di Sacco in Austrian Italy, while in the same year, a few months earlier, Salomon Jarchi's *Comment. on the Pentateuch* appeared at Reggio in Italy, printed in the Rabbinical character. Numerous other Hebrew works followed before 1488, in which year the first entire Hebrew Bible was printed with points, at Soncino, by a family of German Jews. The first English book in which any quantity of Hebrew type was used was Dr. Rhys's *Cambro-Brytannicæ Cymræcæve Linguæ Institutiones*, printed by Thomas Orwin in 1592, though already in 1524 Hebrew characters, but cut in wood, were used by W. de Worde in Wakefield's *Oratio*. But the Hebrew font made use of in Walton's *Polyglott* in 1657 was probably the first important font cut and cast in England, though there were as yet no matrices there for Rabbinical Hebrew. In the beginning of the 18th century Amsterdam was the centre of the best Hebrew printing in Europe. Hebrew.

The first book printed in Arabic types is said to be a *Diurnale Græcorum Arabum*, printed at Fano in Italy in 1514.[1] Two years later P. P. Porrus's *Polyglott Psalter*, comprising the Arabic version, was printed at Genoa; and two years later a *Koran* in Arabic is said to have been printed at Venice. In 1505 an *Arabic Vocabulary* at Granada had the words printed in Gothic letters with the Arabic points placed over them; and in other presses where there were no Arabic types the language was expressed in Hebrew letters or cut in wood. De Guignes and others mention a font of Arabic used by Gromors in Paris in 1539–40 to print Postel's *Grammar*. In England some Arabic words were introduced in Wakefield's *Oratio* of 1524, but apparently cut in wood. In Minshen's *Ductor in Linguas*, 1617, the Arabic words are printed in Italic characters. Laud's gift of oriental MSS. to Oxford in 1635, and the appointment of an Arabic lecturer, were the first real incentives to the cultivation of the language by English scholars. Previous to this it is stated that the Raphelengius Arabic press at Leyden had been purchased by the English Orientalist, William Bedwell; but, if it was brought to England, it does not appear to have been immediately made use of. The Arabic words in Thomas Greave's *Oratio de Linguæ Arabicæ Utilitate*, printed at Oxford in 1639, were written in by hand. Arabic.

Syriac type, probably cut in wood, first appeared in Postel's *Linguarum XII. Alphabeta*, printed in Paris in 1538; but the characters are so rude in form and execution as to be scarcely legible. In 1555, however, Postel assisted in cutting the punches for the Syriac Peshito New Testament, printed at Vienna in 4to, the first portion of the Scriptures, and apparently the first book, printed in that language. In 1569–72 Plantin at Antwerp included the Syriac New Testament in his *Polyglott*, and reissued it in a separate form in 1574. In England Syriac was usually expressed in the earlier works in Hebrew characters. But in 1652, when the prospectus and preliminary specimen of Walton's *Polyglott* were issued, we find Syriac type in use. Syriac.

Of the Armenian character the press of the Vatican possessed a good font in 1591, when Angelo Roccha showed a specimen in his *Bibliotheca Apostolica Vaticana*. A psalter is said to have been printed at Rome in 1565, and Rowe Mores mentions doubtfully a liturgy printed at Cracow in 1549. Armenian printing was practiced in Paris in 1633; but the Armenian bishops, on applying to France for assistance in printing an Armenian Bible in 1662, were refused, and went to Rome, where, as early as 1636, the press of the Propaganda had published a specimen of its Armenian matrices. The patriarch, after fifteen months' residence in Rome, removed to Amsterdam, where he established an Armenian press, and printed the Bible in 1666, which was followed in 1668 by a separate edition of the New Testament. In 1669 the press was set up at Marseilles, where it continued for a time, and was ultimately removed to Constantinople. In England the first Armenian type was that presented by Dr. Fell to Oxford in 1667. The alphabet given in the prolegomena of Walton's *Polyglott* was cut in wood. Armenian.

Of Ethiopic the earliest type appeared in Potken's *Psalter and Song of Solomon*, printed at Rome in 1513. The work was reprinted at Cologne in 1518 in Potken's *Polyglott Psalter*. In 1548 the New Testament was printed at Rome by some Abyssinian priests. The press of the Propaganda issued a specimen of its font in 1631, and again in Kircher's *Prodromus Coptus* in 1636. Erpenius at Leyden had an Ethiopic font, which in 1626 was acquired by the Elzevirs. Usher attempted to procure the font for England; but, his attempt failing, punches were cut and matrices prepared by the London founders for the London *Polyglott*, which showed the Psalms, Canticles, and New Testament in the Ethiopic version. Ethiopic.

Of Coptic the press of the Propaganda possessed a font, and a specimen was issued in 1636, in which year also Kircher's *Prodromus Coptus* appeared from the same press. In England David Wilkins's edition of the New Testament was printed in 1716 from Coptic types cast with matrices which Dr. Fell had presented to Oxford in 1667. The alphabets shown in the introduction and prolegomena to the London *Polyglott* of 1655 and 1657 were cut in wood. Coptic.

Of Samaritan the press of the Propaganda had a font in 1636, and the Paris *Polyglott*, completed in 1645, contained the entire Pentateuch in type the punches and matrices of which had been specially prepared under Le Jay's direction. The font used for the London *Polyglott* in 1657 is admitted to have been an English production, and was probably cut under the supervision of Usher. Samaritan.

With Slavonic type a psalter was printed at Cracow as early as 1491, and reprinted in Montenegro in 1495. The only Slavonic font in England was that given by Dr. Fell to Oxford, and this, Mores states, was replaced in 1695 by a font of the more modern Russian character, purchased probably at Amsterdam. The *Oratio Dominica* of 1700 gives a specimen of this font, but renders the Hieronymian version in copper-plate. Slavonic.

Modern Slavonic, better known as Russian, is said to have appeared first in portions of the Old Testament printed at Prague in 1517–19. Ten years later there was Russian type in Venice. A Russian press was established at Stockholm in 1625, and in 1696 there were matrices in Amsterdam, from which came the types used in Ludolph's *Grammatica Russica*, printed at Oxford in that year, and whence also, it is said, the types were procured which furnished the first St Petersburg press, established in 1711 by Peter the Great. Mores notes that in 1778 there was no Russian type in England, but that Cottrell was at that time engaged in preparing a font. It does not appear that this project was carried out, and the earliest Russian in England was cut by Dr. Fry from alphabets in the *Vocabularia*, collected and published for the empress of Russia in 1786–89. This font appeared in the *Pantographia* in 1799. Russian.

A font of the Etruscan character cut by William Caslon about 1733 for Swinton of Oxford was apparently the first produced. Fournier in 1766 showed an alphabet engraved in metal or wood. In 1771 the Propaganda published a specimen of their font, and Bodoni of Parma in 1806 exhibited a third in his *Oratio Dominica*. Etruscan.

Runic types were first used at Stockholm in a Runic and Swedish *Alphabetarium*, printed in 1611. The font, which was cast at the expense of the king, was afterwards acquired by the university. About the same time Runic type was used at Upsala and at Copenhagen. Voskens of Amsterdam had matrices about the end of that century, and it was from Holland that Francis Junius is supposed to have procured the matrices which in 1677 he presented to Oxford. This font appears in the *Oratio Dominica* of 1700, and in Hickes's *Thesaurus*, 1703–5, and it remained the only one in England. Runic.

Matrices of Gothic type were presented to Oxford by Francis Junius in 1677, and a font of them was used for the *Oratio Dominica* of 1700 and in Hickes's *Thesaurus*. A different font was used for Chamberlayne's *Oratio Dominica*, printed at Amsterdam in 1715. Caslon cut a font which appeared in his first specimen in 1734. This and the Oxford font were the only two in England in 1820. Gothic.

Fonts of Icelandic, Swedish, and Danish were included in Junius's gift to Oxford in 1677, and were, perhaps, specially prepared in Holland. The first-named is shown in the *Oratio Dominica* of 1700 and in Hickes's *Thesaurus*. Printing had been practiced in Iceland since 1531, when a *Breviary* was printed at Hoolum, in types rudely cut, it is alleged, in wood. In 1574, however, metal types were provided, and several works produced. After a period of decline, printing was revived in 1773, and in 1810 Sir George M'Kenzie reported that the Hoolum press possessed eight fonts of type, of which two were Roman, and the remainder of the common Icelandic character, which, like the Danish and Swedish, bears a close resemblance to the German. Scandinavian.

[1] See Panzer, vii. 2.

For the Anglo-Saxon language the first type was cut by John Day in 1567, under the direction of Archbishop Parker, and appeared in Ælfric's *Paschal Homily* in that year and in the *Ælfredi Res Gestæ* of Asser Menevensis in 1574. Anglo-Saxon type was used by Browne in 1617, in Minsheu's *Ductor in Linguas;* and Haviland, who printed the second edition of that work in 1626, had in 1623 made use of the character in Lisle's edition of Ælfric's *Homily*. Anglo-Saxon.

The first font of Irish character was that presented by Queen Elizabeth to O'Kearney in 1571, and used to print the Catechism which appeared in that year in Dublin, from the press of Franeknou. But the font is only partially Irish, many of the letters being ordinary Roman or Italic. It was used in several works during the early years of the 17th century, and as late as 1652 in Godfrey Daniel's *Christian Doctrine*, printed in Dublin. The Irish semiuaries abroad were better supplied with Irish type. A new type was cut by Moxon, and appeared in 1681 in Boyle's New Testament, printed by Robert Everingham. Irish.

The earliest specimen of music type occurs in Higden's *Polychronicon*, printed by De Worde at Westminster in 1495. The square notes appear to have been formed of ordinary quadrats, and the staff-lines of metal rules imperfectly joined. In Caxton's edition of the same work in 1482 the space had been left to be filled up by hand. The plain chant in the Mainz psalter of 1490, printed in two colors, was probably cut in wood. Hans Froschauer of Augsburg printed music from woodeu blocks in 1473, and the notes in Burtius's *Opusculum Musices*, printed at Bologna in 1487, appear to have been produced in the same manner; while at Lyons the missal printed by Matthias Hus in 1485 had the staff only printed, the notes being intended to be filled in by hand. About 1500 a musical press was established at Venice by Ottavio Petrucci, at which were produced a series of mass-books with lozenge-shaped notes, each being cast complete with a staff-line. In 1513 he removed to Fossombrone, and obtained a patent from Leo X. for his invention of types for the sole printing of figurative song (*cantus figuratus*). Before 1550 several European presses followed Petrucci's example, and music type was used, among other places, at Augsburg in 1506 and 1511, Parma in 1526, Lyons in 1532, and Nuremberg in 1549. In 1525 Pierre Hautin cut punches of lozenge-shaped music at Paris. Round notes were used at Avignon in 1532. In England, after its first use, music-printing did not become general till 1550, when Grafton printed Marbecke's Book of Common Prayer, "noted" in movable type, the four staff-lines being printed in red and the notes in black. There are only four different sorts of notes used,—three square and one lozenge. About 1660 the detached notes hitherto employed began to give place to the "new tyed note," by which the heads of sets of quavers could be joined. But at the close of the 17th century music-printing from type became less common, on account of the introduction of stamping and engraving plates for the purpose. Music.

Printing for the blind (compare vol. iii. p. 718) was first introduced in 1784 by Valentin Haüy, the founder of the asylum for blind children in Paris. He made use of a large script character, from which impressions were taken on a prepared paper, the impressions being so deeply sunk as to leave their marks in strong relief and legible to the touch. Haüy's pupils not only read in this way, but executed their own typography, and in 1786 printed an account of their institution and labors as a specimen of their press. The first school for the blind in England was opened in Liverpool in 1791, but printing in raised characters was not successfully accomplished till 1827, when Gall of the Edinburgh asylum printed the Gospel of St. John from angular types. Alston, the treasurer of the Glasgow Asylum, introduced the ordinary Roman capitals in relief, and this system was subsequently improved upon by the addition of the lower-case letters by Dr. Fry, the type-founder, whose specimen gained the prize of the Edinburgh Society of Arts in 1837. Several rival systems have competed in England for adoption, of which the most important are those of Lucas, Frere, Moon, Braille, Carton, and Alston; the last-named, as perfected by Dr. Fry, seems likely to become the recognized method of printing for the blind in all European countries. Printing for the blind.

As regards initials in the earliest printed books, see above, p. 730. The trouble and cost involved in the use of the initial director early suggested the use of wood-cut initials, and Erhard Ratdolt of Venice, about 1475, is generally supposed to have been the first printer to introduce the *literæ florentes*, called also *lettres tourneures*, or *typi tornatissimi*, which eventually superseded the hand-painted initials. Caxton introduced one or two kinds in 1484. Among the earliest to be used are the so-called Lombardic initials or capitals. The more elaborate initials, such as those used in the Mainz indulgences and psalter, by Aldus at Venice, by Johann Schoeffer at Mainz, in 1518, by Tory and the Estiennes at Paris, by Froben at Basel, and by the other great printers of their day, were known as *lettres grises*. Besides these, the ordinary "two-line letters" or large plain capitals came into use; and these were generally cast, whilst the ornamental letters were for the most part engraved on wood or metal. Initials.

Type ornaments and flowers began, like the initials, with the illuminators, and were afterwards cut on wood or metal. The first printed ornament or vignette is supposed to be the scutum or arms of Fust and Schoeffer in their edition of the Bible of 1462. There is no vignette in the Subiaco *Lactantius* of 1465 (as stated by Mr. Reed, *Letter Foundries*, p. 82). In Holtrop's *Monum. Typogr. des Pays-Bas* may be seen borders used by some of the earliest printers of Holland (1475–1490) which would not look bad even in the present time. Caxton in 1490 used ornamental pieces to form the border for his *Fifteen O's*. At the same time the Paris printers engraved still more elaborate border pieces. At Venice entire frames were engraved in one piece, while Aldus as early as 1495 used tasteful head-pieces cut in artistic harmony with his *lettres grises*. Early in the 16th century we observe detached ornaments and flourishes which have evidently been cast from a matrix. Ornaments and flowers.

Literature.—Besides the works of Berjeau, Bernard, Blades, Hawkins, Hessels, Holtrop, Noel Humphreys, Koehler, Jules Philippe, T. B Reed, Sotheby, Wiegel, etc., already mentioned, consult also Bigmore and Wyman, *A Bibliography of Printing*, London, 1880; Geo. Wolfg. Panzer, *Annales Typog.*, Nuremberg, 1793, etc.; Lud. Hain, *Repertorium Bibliog.*, Stuttgart, 1826–38; Holtrop, *Cat. Librorum Sec. XV° Impressorum in Bibl. Regia Hagana*, The Hague, 1856; M. F. A. G. Campbell, *Ann. de la Typog. The titles of other works on the invention, progress, and process of printing, etc., may be learned from the lists of books on such subjects in the works already quoted. (J. H. H.)

Part II.—Practical.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material, the definition being based on the etymology (Old Fr. *empreindre*, from Lat. *imprimere*). Technically the same definition might be applied to such arts as those of calico and oilcloth printing and even of moulding, embossing, coining, and stamping; but in point of fact these are never understood when the word "printing" is employed. There is also printing without pressure, such as photographic printing. The use of a pigment or ink must be regarded as an indispensable element. The application of the term is therefore confined to the use of pressure, and a pigment for literary and pictorial purposes. As thus defined, printing includes three entirely different processes—not inaptly called the polygraphic arts—viz., chalcography or copperplate printing (compare ENGRAVING, vol. viii. p. 391 *sq.*), LITHOGRAPHY (*q.v.*) or chemical stone-printing, and typography or letterpress printing. The last-named is that to which the present article is confined. Definition. Typography, chalcography, and lithography.

The difference between the three methods lies essentially

in the nature or conformation of the surface that is inked, and which afterwards gives a reproduction or image in reverse on the material to be impressed. In copperplate printing the whole of a flat surface is inked, and a portion of the ink sinks into an incision or trench, in which it still remains after the surface is cleansed. When pressure is brought to bear, this ink is transferred to the paper, giving an impression of a line. In lithographic printing the flat surface is protected except at certain places, where it is slightly coated with the ink, which practically leaves the stone quite level, but also marks a line when pressure is brought to bear. In typography the printing surface is in relief. It alone receives ink, the remainder being protected by its lower level. Any kind of printing done from a relief surface belongs to letterpress printing, such as a woodcut, a casting in metal, india-rubber, celluloid, xylonite, etc. (or "stereotype"), or a deposition by electricity (or "electrotype"). The typographic method requires a surface that is more difficult to form than either of the other two. In lithography the surface may be obtained by merely writing or drawing on the stone; in copperplate printing the line may be immediately incised into or scratched on the plate; but for letterpress printing the surface between the lines in relief has to be cut away. Hence the tediousness of wood-engraving, in which all the surface of the block has to be removed except those parts that are to be printed from and which form the black lines in the impression; and the conformation of a type surface is similar.

Typography, however, has many compensating advantages. Impressions are taken with much greater facility. The inking appliance glides over the relief lines to be printed from, whereas it would cling to the entire surface of the stone or the metal; hence much greater pressure would be required in these cases. The unprintable part of the stone in lithography has to be damped, so as to repel the ink; the same portion has to be inked and then cleaned off in copperplate printing; but in letterpress printing the ink only that has to be transferred to the paper needs to be applied to the type. When the design has been drawn on the stone or scratched into the copper, the result does not admit of any further application beyond that at first contemplated. But in letterpress printing the surface may be of a composite character. It may be formed of single pieces representing the several letters, and these, when once formed, may be employed in endless combinations. Only by such means are cheap newspapers and books possible. Before the invention of typography (as in the East to the present day), the different pages of a book were printed from wooden blocks, cut after the manner of a wood-engraving. Blocks of this kind are of no use for printing after their first purpose has been fulfilled. They must necessarily be made very slowly and with much labor. In forming a page of a book, on the other hand, by the typographic method there need (excluding necessary wear and tear) only be the cost of "composing" the types and of "distributing" them into their proper receptacles, from which they may be retaken many times to form other compositions.

Types: their Material Characteristics.

Book-work font.

Exclusive of such printing surfaces as wood-blocks and casts, the letters, marks, and signs with which letterpress printing is executed are called *types*, a proportioned quantity of each of the letters of the alphabet in any one body or face forming a *font*. A book-work font contains single letters, diphthongs, ligatures (such as ff, fl), accented letters, figures, fractions, points, reference marks, dashes or metal rules (as ———), leaders, (as .....), braces (⏞⏟), and signs (as &, £). It also includes quadrats,—pieces of metal of various widths, which do not print, but are used to compensate for the shortness of occasional lines, as at the close of a paragraph—and spaces which separate words and letters. There are thus about 226 separate characters in every ordinary English book-work font. The table used by type-founders to regulate the number of each of the several sorts in a font is called *a bill of type*. The sorts are supplied by English type-founders in certain definite proportions, depending upon the number of lower-case m's. A bill of 3000 m's usually contains the sorts given in Table I.

Bill of type.

Such a font would weigh 750 ℔ if of pica size, 480 ℔ if long primer, 400 ℔ if bourgeois, 330 ℔ if brevier, 280 ℔ minion, 220 ℔ nonpareil. The numbers of the respective letters are based on the requirements of the English language:[1] other languages of course require different proportions. In Latin and French, for instance, q and u would be deficient, h in excess, and w needless. The number of the respective letters may be, and sometimes is, apportioned by weight; for example, in one of the "schemes" of fonts used by type-founders a font of 125 ℔ Roman with, as its complement, 10 ℔ Italic, includes 8 oz. of E, M, C; 9 oz. of T; 8 ℔ of e; 5 ℔ each of a, h, n, o, t; and so on down to 3 oz. of z. To estimate the quantity of type required for a page, the number of square inches it contains is measured and divided by 4, the quotient being the approximate weight of the matter in pounds. In small fonts, however, 50 per cent. is added, and in large ones 30 to 40 per cent., to allow for the letters generally left in the cases, not being required in the job, and for sorts, etc. These figures, although useful, are only approximative, the proportion of the several ingredients of type-metal used by different founders for the various sizes of type greatly varying the calculation.

TABLE I.

Lower-case.			Figures, etc.			Capitals.			Small Caps.

Large quads, one-tenth of font. Italic, one-tenth of Roman.

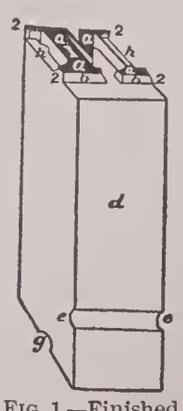

FIG. 1.—Finished type.

Parts of a type.

Each of the parts of a type has a technical name. In the annexed diagram (Fig. 1) of the capital letter M the darkest space *a, a, a, a*, is called the *face;* and only that part of the type touches the paper in printing. The face is divided into the *stem*, marked 1, which comprises the whole outline of the type M; the *serifs*, or the horizontal lines marked 2, which complete the outline of the letter; the *beard*, consisting of the bevel or sloping part marked *b, b*, and the *shoulder* or flat portion below *b*. The shank is the entire body of the letter, *d*, the front part (that shown) being known as the *belly* and the corresponding part behind as the *back*. The spaces at *h* and *h* are the *counters*, which regulate the distances apart

[1] There is a tradition in one of the oldest English foundries that this scale originated in a laborious calculation of the comparative number of different letters used in setting up a lengthy debate in the House of Commons, it being supposed then that the purest English was spoken there. The scale is, however, frequently found defective in practice. It is a curious fact, for instance, that the matter of Charles Dickens's works will empty the vowel boxes long before those of the consonants, and that Lord Macaulay's statelier style will run with like persistency on consonants.

of the stems in a line of type. The hollow groove extending across the shank at *e, e* is the *nick*, which enables the workman to recognize the direction of the type and to distinguish different fonts of the same body. The absence of this simple expedient would retard the operation of composing types by fully one-half. The earliest type-founders did not know the use of the nick. In some letters, such as j and f, a part of the face overhangs the shank; this is called the *kern*. The groove *g* divides the bottom of the type into two parts called the *feet*. An impression from that part of a type on which it stands would be as Types must be perfectly rectangular, the minutest deviation rendering them useless. Any roughness at the sides is called *burr*, and any injury to their faces a *batter*. Smoothness, sharpness of augle, and perfection of finish are also prime requirements. A line of types, when viewed along the back, presents the appearance of a solid bar of metal.

Species of letter.

Types which have the face cast in the middle of the shank, as a, c, e, m, etc., and thus leave an open space above them correspouding to that below, caused by the beard, are known as *short letters*. Those whose stem extends to the top of the shank, as b, d, f, etc., are called *ascending letters*. Those that have a stem extending over the shoulder, as g, p, etc., are called *descending letters*. Those that are both ascending and descending, and extend over the whole of the shank, as Q and j, are *long letters*. Small letters and figures cast upon the upper part of the shank, as 1^a, are called *superiors;* those very low down on the shank are *inferiors*, as H_3. Types that are very heavy and massive in appearance are called *fat-faced;* those that are fine and delicate, *lean-faced*. A type whose face is not in proportion to the depth of the shank (*e.g.*, a small pica cast on a pica body) is a *bastard type*.

Specimens of principal bodies.

Types are of various sizes, ranging from those used in printing pocket Bibles to those for large placards. The variation is confined to the superficial dimensions of their ends, or *bodies*, as they are called. Each body has a distinctive name. The following are specimens of the principal bodies of ordinary types, and show the relation of the various bodies one to another:

Brilliant—239 lines to the foot.

Size of types.

It is a confusing and inconvenient anomaly that the types made by different English founders vary in size, although they bear the same name. The above figures refer to the types of Messrs. Miller & Richard, the royal type-founders for Scotland; but other eminent makers supply, for instance, long primer which is 89½, 90, or 92 lines to the foot. This has been remedied in America by an agreement on the part of the founders to adopt one standard pica, to divide that pica into a certain number of equal parts, and to cast all their types as multiples of one of these parts. They divide the pica into twelve points, and the point is the unit upon which the system is based. There is also another practical advantage in this multiple system: each type bears a simple proportion to the others, and therefore can be used in exact combination. Thus pearl is 5, nonpareil 6, minion 7, brevier 8, bourgeois 9, long primer 10, small pica 11, and pica 12 points. In Germany, France, and other countries of the Continent a uniform system of points has been adopted, based on a scale of 133 "Ciceros" (corpus 12) to 60 centimetres. The types which most nearly correspond to those already mentioned are:

	Point Ems to Foot.	Size in Centimetre		Point Ems to Foot.	Size in Centimetre.
Perl 5.....	162.15	.1879	Borgis 9.....	90.08	.3383
Nonpareille 6.	135.12	.2256	Garmond 10.....	81.07	.3759
Colonel 7.....	115.83	.2632	Cicero 12.....	67.56	.4511
Petit 8.....	101.34	.3008			

The number of lines given to the foot in the above specimens of bodies is the theoretic and practically the only approximative standard. The height of types varies slightly with different founders, the mean being $\frac{29}{32}$ in. The old Scotch height is about $\frac{1}{100}$ in. higher. Types lower than the ordinary dimension are said to be *low to paper*, and if surrounded by higher types will not give a perfect impression. Spaces and quadrats were formerly only three-fourths of an inch in height; but, since electrotyping has become so common they are almost invariably cut high, *i.e.*, up to the shoulder of the type. Six lines of pica and twelve lines of nonpareil each cover an inch in depth. It is, however, not possible to know the size of a type in a printed page by placing a rule measure upon it, as many books are not set solid: the lines are not close together, but leaded out with pieces of lead, to make them cover a larger space. A communication of great importance contributed to a newspaper may be set up in the same type as the leading article; but if not leaded it will appear to the non-technical reader to be in a smaller character.

The width of pages or columns, in the technical language of the printing office, is expressed according to the number of "ems,"—that is of a pica m,—the square of the depth of pica. As the latter is one-sixth of an inch, the em is the same width, and a page of twenty-four ems wide is equal to one 4 inches wide. The columns of this ENCYCLOPÆDIA are 17 ems wide.

Varieties of face.

According to the purpose for which they are used, types are divided into two classes—book type, including Roman and Italic, and job type, including a multitude of fanciful forms of letters, chiefly founded on the shape of the Roman and Italic letters, and intended to be more prominent, delicate, elegant, etc. It is impossible to enumerate all the varieties of the latter class, as additions are being constantly made and once popular styles always going out of fashion. The leading varieties are the antiques, which are Roman letters with strokes of nearly uniform thickness, as M: sanserifs or grotesques, which have no serifs, as M; blacks, as M; and scripts which represent the modern cursive or Italian handwriting, as *M*. Black letter is now only a jobbing type in

English-speaking countries, although, as stated in the historical section of this article, it was the first character used in printing. It is still used in Germany, with certain modifications, as the principal text-letter for books and newspapers. A comparison of the numerous reproductions that have been issued of Caxton's works with any modern line of black letter will show how greatly the form and style have been altered within a period of four centuries. The present style of Roman type dates only from about the first quarter of the 18th century. Previously the approved shape was as follows:

Printing has been defined to be the act,

The use of this type was revived by Whittingham of the Chiswick Press about 1843, and it has since become a favorite form, under the name of old style. Some of the punches cut by the first notable English type-founder, William Caslon (1692–1766), have been preserved and types are being constantly cast from them. Nearly all founders now produce modernized old style. For the recent revival of old style printing, see p. 756 below.

Large letters, such as are employed for large bills and posters, are made of wood, chiefly rock maple, sycamore, pine, and lime. These are cut up, planed to the required size, and then engraved, generally by special machinery, this being a business quite distinct from that of letter-founding. The larger letters are designated as two line, three line, four line, etc., —meaning twice, thrice, or four times the depth of face of pica or great primer, etc.

Type metal. Type metal is an alloy, of which lead is the principal ingrédient; but, owing to its softness, antimony and tin are added (see vol. ii. p. 114 and vol. xiv. p. 378). A patent type metal (Besley's) was invented in 1855 in which the mixture consisted of lead, regulus of antimony, tin, nickel, copper, and bismuth. Nearly all type is now made with some of these metals superadded. Ductility, hardness, and toughness are the prime requisites of a type metal.

Making of types. The earliest printers made their own types, and the books printed from them can now be distinguished with almost as much certainty as handwriting can be identified. The modern printer has recourse to the type-founder. The first step in the making of type is cutting the letter on the end of a piece of fine steel, forming the punch (see Fig. 2), which is afterwards hardened. This is an operation requiring great care and nicety (there being comparatively few adepts at it), in order that the various sorts in a font may be exactly uniform in width, height, and general proportions to each other. A separate punch is required for each character in every font of type, and the making of them is the most expensive branch of type-founding. During the process of its manufacture the punch is frequently tested or measured by delicate gauges to insure its accuracy. When finished it is held over a light, the flame of which blackens the letter, and thus enables an impression, called a *smoke proof*, to be stamped on paper. When the letter is perfect, it is driven into a piece of polished copper, called the *drive* or *strike* (Fig. 3). This passes to the justifier, who makes the width and depth of the faces uniform throughout the font. They must then be made to line exactly with each other. When completed, the strike becomes the matrix (Fig. 4), wherein the face of the type is made. This method of making a matrix has until now been in almost universal use in Great Britain. It is, however, a very slow and costly process. In America the great majority of matrices are made otherwise. If the design of the font to be produced is original, it is often cut by hand or by an engraving-machine on the piece of metal which is to form the matrix. If, on the other hand, an existing font has to be copied, the matrix is made by electro-deposition. A perfectly good type is selected, and inserted in a mould specially made, called a *fusible mould* (Fig. 5). Sufficient metal of a more fusible nature than the type is cast round it, and forms a shape similar to that of the ordinary matrix. This fusible cast is then placed in a box protected by glass and gutta-percha, in order that the copper deposit may be kept square and to the proper dimensions. This arrangement also limits the deposition to the face. The box is immersed in the copper electrotyping solution, in which it may be left until the deposit of metal has increased to a thickness at which it may be backed up with copper, or it is left until it reaches the full thickness, which is about $\frac{5}{16}$ of an inch. It is then fitted in line, set, position, and height. The minutest imperfection or blemish is reproduced by the deposition, and the type cast from such a matrix is a perfect counterpart of the original. A school of type-engravers has recently sprung up in the United States, cutting exclusively on metal and producing ornamentation and finish which the punch-cutters cannot rival. It is expected that in the course of time the electrotype matrix will nearly supersede that made in the old-fashioned way with the punch. In the ordinary method the mould in which the body of the type is formed is made of hardened steel in two parts; one part is fastened to the machine and is stationary, while the other is movable so that it may be adjusted for the proper width of the letters, as one is wider than another. The combined matrix and mould are then adjusted to the type-casting machine, which manufactures types at the rate of from 25 to about 120 per minute according to the body. The metal is kept fluid by a little furnace underneath and is injected into the mould by a pump, the spout of which is in front of the metal pot. The mould is movable, and at every revolution of the wheel it comes up to the spout, receives a charge of metal, and flies back with a fully formed type in its bosom; when the upper half of the mould is lifted, a type is ejected. The spring in front holds the copper matrix in close proximity to the mould. The letter a, for instance, stamped in the matrix is directly opposite the aperture in the mould which meets the spout of the pump. When a due proportion of a's are cast, another matrix with b stamped on it takes its place, and so on throughout the whole font. The types, however, are not finished when they leave the machine. There will be found attached to each a wedge-shaped *jet* (Fig. 6), somewhat similar to that on a bullet cast in a hand-mould. These are picked off by boys at the rate of from 2000 to 6000 per hour. A burr which still adheres to the shoulder of the type is taken off by the rubbers, who rub the sides on circular stones or on files. The types afterwards go to the setters, who arrange them in long lines ready for the dresser, and he slips them into a long stick, turns them on their face, and, after duly fastening them, cuts with a plane a groove in the bottom, which forms the feet. (These processes are now frequently performed by a machine, which produces types that do not require rubbing or dressing.) The types are then dressed and the picker takes them in hand, in order to pick out each defective letter with the aid of a magnifying glass. They are finally made up into parcels of a convenient size, called *type founders' pages*, weighing about 8 lb each.

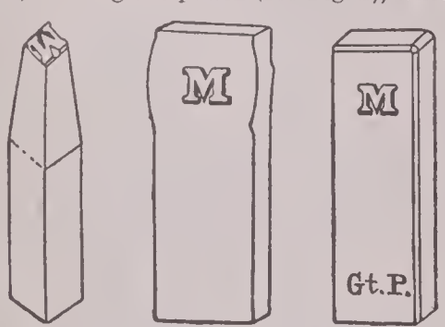

Fig. 2.—Punch. Fig. 3.—Drive. Fig. 4.—Matrix.

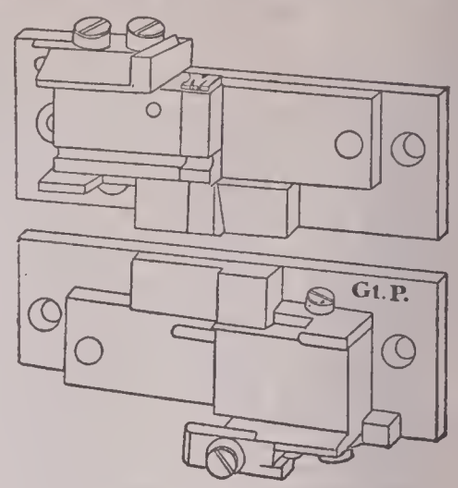

Fig. 5.—Mould.

Fig. 6.—Type with jet.

Automatic type-casting and finishing machine. Subjoined is a description of a machine for performing automatically the various operations of casting and finishing type which was invented about twenty years ago by Messrs. J. R. Johnson and J. S. Atkinson. In this apparatus the metal is fused, injected into the mould, the cast letter turned out, rubbed or planed, first on one side and then on the other, the feet cut out and smoothed, the

dressed sides planed alternately, and the finished letter set up on a stick ready for use by the printer. The casting machine and the dressing machine are in reality distinct, though mounted on a common frame. The whole is driven by a steam-engine or other prime mover. The casting machine consists of a furnace covered by a shallow pot holding the fused metal. In this is a pump, and the mould is placed opposite its nozzle. The mould being adjusted and the matrix in its place, the molten metal is injected and then solidifies, forming a perfect type, but with jet attached. This letter is then thrust out, and the mould closes again for another jet of molten metal. All this is effected by one revolution of the axle of the machine. The letters pass through a channel one by one into the dressing machine. On arriving there they have each of their sides planed in succession by being held against cutters. When one side is made true with respect to the set of the letter on its face, it is passed over a second cutter, which planes the second side absolutely parallel to the first. After this the type is carried in a line at right angles to its former course past a series of similar cutters, which plane out the foot, further smooth its surface, and plane each of the two dressed sides in succession; this completes the dressing or finishing of the types, which, continuing on their course, pass upon a composing stick and are ready for the printer. The line of types presents the appearance of a solid bar of metal, so true, flat, and square are the surfaces of the several separate letters. This machine has been considerably improved by Mr. P. M. Shanks. The new machine is of simpler construction and its parts are more compact. It does not produce better type, nor work quicker,—the speed in all type machines being regulated by the time required to cool the volume of metal, which, when on the machine, is assisted by having water percolating through the heated parts of the mould. The working of the new machine is more readily grasped by the manipulator, and there is considerable reduction in its cost.

Type-Setting or Composing.

We may now describe the manipulation of the types in the printing office, and for the sake of conciseness reference must be made only to the operations connected with ordinary book-work. These differ in details from the methods in use in the other two departments of the printing business,—news-work and job-work.

The types, received from the foundry in the packages called pages, are placed in shallow trays called *cases*. These contain compartments or *boxes*, each of which is appropriated to some particular *sort* or character. The cases when in use stand on *frames* or sloping desks. The case at the top is the *upper case*, and that below the *lower case*. The former contains ninety-eight equal-sized boxes, appropriated principally to the capital and small capital letters; the latter has fifty-three boxes of various sizes, appropriated to the lower-case sorts. The difference in the size of the boxes corresponds to the difference of quantity of letters in a font, as already stated,—the lower-case e for instance, having the largest box. The localization of the letters, etc., is a subject on which opinions differ, the object being to bring the letters most frequently required nearest to the hand of the compositor as he stands at work. As a man picks out from the boxes seldom less than 1500 letters per hour and distributes or replaces on the average about 5000 per hour, it is necessary that the most economical allocation of the boxes should be adopted. The system of allocating the various types is called the *lay* of the case: Fig. 7 illustrates the plan used in the principal English book offices; but there are many deviations.

Type-case.

The types when taken from the cases are arranged in lines or "composed" in an instrument called a *composing stick*, made of iron, brass, or gun-metal. The slide in the middle is movable so as to accomodate varying lengths of lines. In the composing room the frames are arranged in rows, supporting the cases. The compositor fixes the "copy," or document which he is to repeat in type, in a convenient place before his eye, and on some part of the case that is seldom used. In his left hand he holds the composing stick, and with the thumb and first finger of the right hand lifts the letters from the boxes, and arranges them in the composing stick, every letter, point, or sign being picked out separately. In this operation he is much assisted by the use of a *setting-rule*, a thin brass or steel plate which, being removed as successive lines are completed, keeps the type in place. When so many words and parts of words as will nearly fill the line have been composed, it is made the exact length required by inserting or diminishing the space between the several words. This is called *justifying* the line and is effected by means of the spaces already mentioned. If the work is not "solid"—that is, if the lines are not close together—the strips of metal called *leads* are used. They vary in thickness, but always form aliquot parts of pica body. A good compositor must possess intelligence and a reasonable amount of general knowledge: he must be able to read his copy with readiness, and to understand its meaning, in order to punctuate it properly. He should be able to spell correctly, as some copy is almost undecipherable in regard to separate letters, while other copy is incorrectly spelt. When the composing stick is filled, the type is lifted on to a *galley*, a shallow tray of wood or metal, two or three sides of which are flanged, for the purpose of supporting the type, when the galley is slightly inclined. Stickful after stickful of type is placed on the galley until it is full. The matter is then fastened up, a proof taken at the proof press, and the work of the *reader* or corrector of the press —described below—begins. The proof, marked with the necessary corrections, is given back to the compositor, in order that he may make the required alterations in the type.

Composing.

The type, being duly corrected, is made up into pages of the required length (unless the author has desired to see proof in *slip*). It is then *imposed*, that is, the pages are arranged in such a manner that, when printed and the sheet folded, they will fall in due numerical sequence. The impression from any arrangement of pages will be the reverse of that in which they are laid down. If an ordinary four-page newspaper supplement be opened and spread out with the first page uppermost, it will be found that on this side the order of pages is 4, 1; when turned the pages are 2, 3. The type pages must be ranged in the reverse way, as 1, 4; 3, 2. Thus the fourth page is placed alongside the first, because

Imposing.

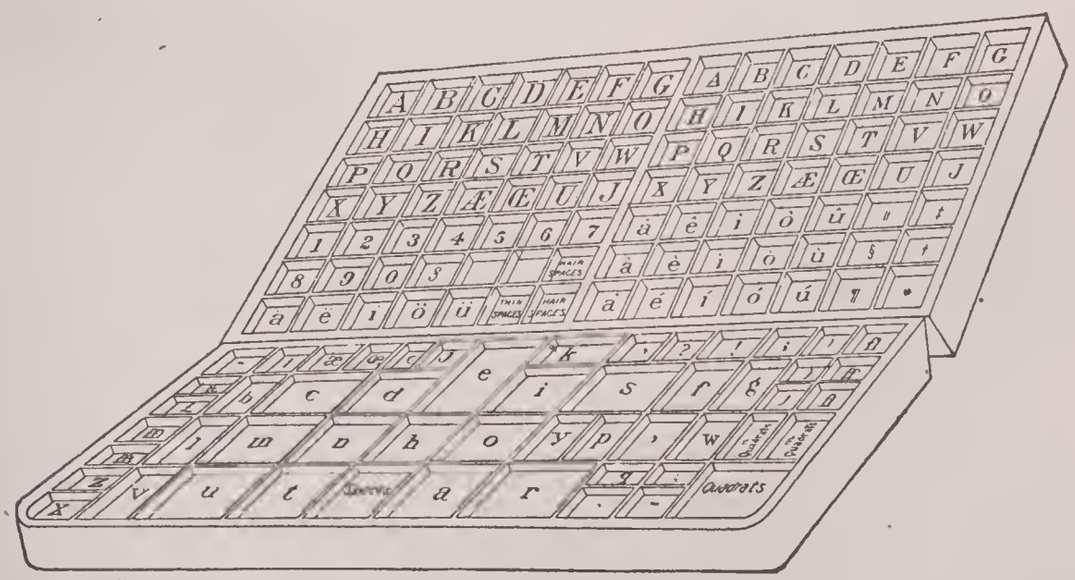

FIG. 7.—Type-case.

both must be printed together on the outside: the third page is to the left, and the second to the right, because in books the odd page—the *recto*—is always to the right. For a quarto a sheet of paper is folded twice, that is once across its breadth and then once in a perpendicular direction down the middle. It contains four leaves, and if these are printed on both sides eight pages. The two sides of a sheet are called the outer and inner forms respectively. A sheet of octavo is folded three times, making 8 leaves or 16 pages. The size of a book depends, not only upon the number of times the sheet has been folded, and described accordingly as 4to, 8vo, 12mo, etc., but upon the size of the sheets. The dimensions of the papers commonly used in book-printing are: imperial, 22 × 30 inches; super royal, 20½ × 27½; royal, 20 × 25; medium, 19 × 24; demy, 17½ × 22½; double crown, 20 × 30; double foolscap, 17 × 27; post, 15¾ × 19½. Hence to say that a book is a quarto merely gives no precise indication of its dimensions, as a quarto of one size of paper may be smaller than an octavo of another; it is also necessary to know the size of the sheets of which it is composed.

Signatures.

When a printed book is opened, it will be found that at the foot of certain pages there is usually a letter and at the foot of another a letter and a figure, as B, B 2; further on another letter and another letter and figure. On going through the book it will be seen that the letters are in regular alphabetical order, and occur at regular intervals of eight, twelve, sixteen, etc., pages. These designate the several sheets of which the book is composed and are called *signatures*, so that a sheet may be designated B, and the pages of which it consists are thereby sufficiently indicated. (Occasionally, as in the present work, numbers are used instead of letters.) These signatures assist the binder in folding, as they occupy a certain specified place in each sheet; hence to ascertain if the sheet has been folded properly it is only necessary to examine the position of the signature. The binder also is thus assisted in *gathering* or collating together the sheets of a volume in proper order. Signature A is omitted, because it would be on the title or first page, and would be both unnecessary and unsightly. By old custom J, V, and W are discarded, I and J, U and V being originally used indiscriminately by printers, while W was written UU or VV. When the alphabet is exhausted, a new one is commenced, distinguished by a figure preceded, as 2B, 2 C, etc.

Form.

The pages of types are arranged in proper order on a flat table, covered with stone or metal, called the *imposing-stone*, and are then ready to be made into a *form*, that is, in such a state that they can be securely fastened up and moved about. The form is enclosed in an iron frame or *chase*, subdivided by a cross bar. The portions of the type are separated by *furniture*, which may be of metal or wood or both. It is of the same height as the chase, but lower than the type, and therefore does not print, but forms the margin of the printed pages. At the sides of the two sections of the forms are pieces of furniture of a tapering shape, called *side-sticks*, and at the top and bottom corresponding pieces, called *foot-sticks*. Small wedges, called quoins, are inserted and driven forward by a mallet and a *shooting-stick*, so that they gradually exert increasing pressure upon the type. Other mechanical means for locking up are also occasionally adopted. When sufficiently locked up, the whole is quite as firm and portable, however many thousands of pieces of metal it may consist of, as if it were a single plate. In this rapid sketch we purposely omit mention of several operations which, though important and indispensable, are only of interest to the workman.

Type-setting machines.

For many years endeavors have been made to construct machines for type-setting which should obviate hand labor. Picking out the types separately from their boxes and arranging them singly in the composing stick is an irksome and monotonous operation, and one which it might be thought comparatively easy to perform by automatic machinery. But of the many different composing machines that have been invented less than half a dozen have stood the test of practical experience. These have been confined to special classes of work, and it is open to doubt whether the nimble fingers of a good compositor, aided by the brains which no machinery can supply, do not favorably compare on the ground of economy with any possible mechanical arrangement. On the other hand, employers and makers of machines allege that owing to the opposition of the men machine type-setting has not had fair play. However that may be, it is undeniable that a composing machine is still rare in printing offices, and where employed it is only as an auxiliary to the ordinary labor of the men. It deserves to be mentioned that nearly the whole of the *Times*, with the single exception of the advertisements, has for years past been set up by machinery. We have not space to describe with any minuteness the construction of composing machines. In the Fraser machine (Fig. 8), one of the

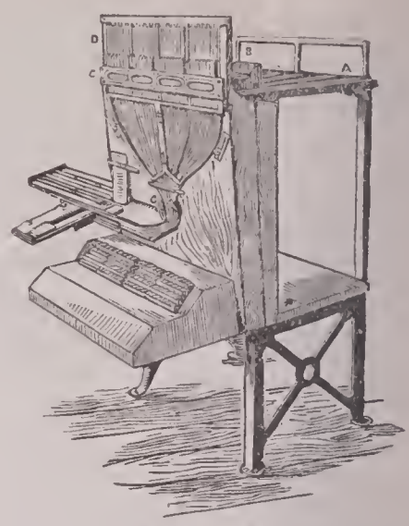

FIG. 8.—Fraser composing machine.

simplest of its class, which has been made use of to the extent already mentioned in the present work, the types are contained in a series of grooved trays A, in the upper part of the machine, the trays having previously been filled by complementary apparatus called the *distributor*. In these trays the types are kept in position, and pressed towards the front part of each tray, by slips of metal attached by cords to the box-wheels B; each of these contains a spring of sufficient strength to press the line of types steadily forward against the separators C, which are formed with an inverted shoulder, under which the front type in each line passes. The keys are connected by levers to the separators, and the depression of any key causes the corresponding separator to descend, carrying with it the front type of the line into the grooved face-plate, down which it slides into the composing stick G. Immediately the finger is lifted from the key the spiral spring D raises the separator to its original position, and the next type in the line takes the place of the one just released, and so in succession as fast as the keys can be pressed. Under the keys runs a rod connected by a crank motion with the pusher G, which, with every depression of a key, pushes forward the line of type in the composing stick, thus making room for the next letter. The matter is thus set in one continuous line, ready to be divided into lines of the required length either by the operator at the machine or by another hand working in conjunction. The speed of the machine varies from 6,000 to 12,000 types per hour, but is regulated solely by the skill of the operator, as the machine will work as fast as the keys can be pressed. The composing machines now employed at the *Times* office are an improved form of an apparatus invented by Charles Kastenbein, and introduced there in 1872. The operator sits in front of four rows of keys one above the other, something like the manuals of an organ, but only about three feet wide. Each of the keys corresponds to a type or character. The types are kept in tin tubes placed vertically at the top of the machine. The depression of a key works a series of levers, and an iron finger pushes the undermost type from its tube, when it falls into a groove formed in a conducting plate, narrowing at the bottom to its apex. Immediately below is a receptacle, and by the action of a treadle the type is pushed along a channel. Other letters follow, the matter being thus set up in a long line, on a groove of the width of an em quad., and running from left to right. The type when it first comes into the groove is in an upright position, but in passing along it becomes twisted, so that the letters stand at an angle of about 45° when they reach the point at which they are justified. This groove communicates at its dexter extremity with the justifying galley,—a simple apparatus, something of the nature of a composing stick and galley combined. Then the type is divided into portions or lines of the required length and justified in the galley, which is adjustable to the width of the required length. As the long line approaches him, the justifier with a small bodkin accelerates a portion large enough in his judgment to fill the width of his column. When this is done he presses his foot on the treadle under him, and thereby causes the line to be pushed into the galley. The line is justified by spaces and quads, and

enough type is then taken for another line. The speed depends on the operator, and varies from 6,000 to 13,000 types per hour, the average being about 8000, with two operators, —a justifier and a compositor being also necessary. These machines are worked in the *Times* office at the rate of a column of solid minion an hour. The machine occupies a floor space of only about 4 feet wide by 2 deep.

Another machine at present in use is that of Mr. Robert Hattersley of Manchester. It probably furnished the general scheme of others in use. One of the most ingenious machines of the kind is that of Mr. Alexander Mackie of Warrington, its general principle being the adaptation to setting up types of the Jacquard card of the power loom, which weaves automatically the most intricate patterns of cloth. The apparatus consists of three parts,—two used for preparing the "card" or ribbon, which directs the third in the operation of type composing. The perforator is like a small cottage pianoforte. When the keys are struck they produce a perforation, and the ribbon is made to move aside a little, so that a new surface may be presented for puncturing. The composer is a circular iron table, 4 feet in diameter, having round its periphery a number of boxes divided into sections, each of which holds one kind of type. On a slightly lower plane is a wheel carrying little brass tables, hinged at one end. When the machine is in motion, the types are pushed out on to the table, which passes with its freight round its course until it comes to the point of delivery, when the types are swept off. The rising of the table, and the drawing out of the types, are guided by the perforated paper. Hence the machine sets types without a human compositor. When once the ribbon is perforated, it may be used over again for subsequent editions of the same work, which may be in a different size of type. These machines are only in use in the office of the inventor.

As has been already described under REPORTING (vol. xx. p. 418), the parliamentary reports of some newspapers are set up entirely without copy,—by the ear, not by the eye. It has been found that by the aid of the machine the matter can be set up half as fast again as it could be written out: the average speed of the composing machine is 230 lines per hour when the copy is dictated to the operator, whereas the most skilful workman setting at ease in the usual way can do but fifty lines per hour.

Logotypes.

For many years it was a favorite idea with inventors, especially those who were not practical printers, that great economy might be gained in composition by the use of word-characters or "logotypes," instead of single letters. The constant repetition of many words seemed to suggest that they might be cast in one piece. Combinations suitable for affixes and suffixes, as ad-, ac-, in-, ing-, ment, etc., it was also suggested, should be used instead of the single component letters. The suggestion has, however, not been carried out, at least to any considerable extent. The chief practical objection to it is that it involves the use of cases with an inconveniently large number of boxes. The more the variety of characters is multiplied the more "travel" of the compositor's hand over the cases is necessary for picking them up, and by so much is the speed of his work retarded. Logotypes, too, are more liable to accident; when one letter is damaged the combination is rendered useless.

Correcting type.

The correction of the type is a subject that should be understood by all who have to do with printing, as many mistakes are made on the part of authors which a little technical knowledge would prevent. In the course of setting any *copy* or MS. which may be given him the compositor unavoidably picks up some wrong letters, or mistakes the words in the copy before him, or fails to follow the style prescribed for the work. These are called *printer's errors*. When the compositor has finished his task, a first proof of the matter is taken. This proof is read through and compared with the copy by the proof-reader or *corrector of the press* and an assistant, the *copy-holder* or reading-boy. The proof is then sent back to the compositor and the latter is required to correct all the inaccuracies indicated therein—in fact, to attend to all the directions given by the reader—and this has to be done at his own cost if he is working on piece—that is, paid by results according to work done—or by the employer if he is working "on establishment wages" or paid by time. Another proof called a *revise* is now taken; this is carefully compared with the previous proof. If the corrections have not all been made, the revise is marked accordingly, and sent back to the compositor, who is required to remedy the imperfections. When the proof is deemed accurate or "clean," it is sent, generally along with the copy, to the author,—being now termed an author's proof. Finally, in the printing office the matter is carefully re-read and compared with the last author's proof by the press-reader, who signs it and on his responsibility the type is printed off.

Distributing type.

The operation of distributing the types is the converse of that of composing: it is de-composing the form and returning the several letters to their proper boxes in the case. It is done, as already mentioned, with remarkable rapidity. The form is first washed over with an alkaline or other detergent to remove the ink from its surface, and then laid down on the imposing surface, unlocked, and damped; this assists the cohesion of the type, after the chase, furniture, side-sticks, etc., are removed. The compositor then takes in his left hand, supported by a setting rule, a portion of type in lines, and with the right hand takes a word or so between the finger and thumb, letting each letter drop separately into its proper box. There is hardly any operation which so strikes a spectator as distributing, for a competent distributor literally showers the types into their receptacles. The types are held upside down, that is, with the nicks uppermost; hence the letters of each word are read from left to right like ordinary matter when printed, but the words are of course dealt with in the inverse order.

Type distributing machines.

Distributing machines of many different kinds have been invented. They may be divided into two classes,—those worked entirely by keys or notes, like the pianoforte, and those in which the distributing is to a certain extent done automatically. For the former class only the type in ordinary use in printing offices is required. For the latter the type requires to be specially prepared, each character having a distinctive nick or nicks upon it, which correspond with the particular channel of the machine it is intended to occupy, and by which it is guided to its special compartment. Kastenbein has produced a distributor which may be described as a composing machine reversed. The matter to be decomposed is placed at the top in its appropriate tray or fixed galley, the sides of which are adjustable to fit any measure, the back being so constructed that it may be advanced to keep the matter always up to the front. As the matter is pressed towards the front, the first letter of it is brought in contact with a steel pusher, behind it being an aperture communicating with the channel of the guide plate. The matter is read by the operator; and he touches the key corresponding to the letter that comes first. Thus the types are conveyed one by one to the guide plate or conductor. It has grooves furnished with little gates or switches, like the points of a railway, and these direct the types into their proper channels. The tubes into which the types are deposited are placed at the foot of each groove. Thus every time a key is depressed the switches move, the pusher sends the type to be distributed out of the line, it falls through the aperture, and, passing down the channels in the guide plate, reaches the proper tube. The speed is

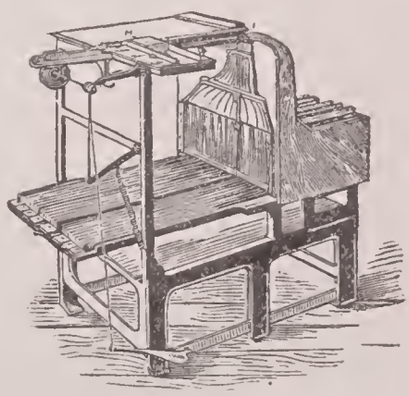

FIG. 9.—Fraser distributing machine.

to a certain extent dependent upon the skill of the operator, but averages between 3500 and 4000 per hour. A good compositor can by hand alone distribute as many letters as this. But for the purposes of the composing machine hand-distributed types would have to be set up again, as the composing machine is supplied not from ordinary cases but from tubes of type. In the Fraser distributing machine (Fig. 9) the page of matter to be distributed is placed on the upper part of the machine at H, whence by suitable apparatus it is moved line by line towards the separator I in front. The matter is there read by the operator, and as each letter comes in contact with the separator the corresponding key is pressed and the type is conveyed to the guide plate, where a series of switches guide it to its proper compartment in the tray of the composing machine.

Stereotyping, Electrotyping, etc.

Advantages of stereotyping.

The method of reproducing and multiplying letter-press printing surfaces by taking casts of them, or stereotypes, has greatly conduced to the progress of typography,—much more so, indeed, than might be realized by those who are unacquainted with the practical details of the art. Stereotyping (*στερεός*, fixed or solid ; *τύπος*, type or form) is the method of taking casts from a fixed or movable form ; thus, printing from stereotypes is distinguished from typography, in which impressions are taken from movable types. It does not supersede type-founding, but supplements it, for a page of reading matter requires first of all to be set up letter by letter, and then the casts or plates are taken, each of which may be printed from with nearly as much perfection as from the original form. Hence a printing surface may be reproduced to an almost infinite extent, and the means of production of impressions on the press or machine are increased in proportion to the number of casts taken. It insures an accurate copy of an original text, whereas in reproduction by resetting the movable types there is a liability to deviation. When only a cast is worked from, any accident may be repaired by taking another cast, and the cost is slight compared with that of composing over again. A smaller quantity of type may be used in an office where this process is used ; a portion of a work may be set up, a cast taken, and the types returned to the cases. The plates are more easily stored than movable forms, and are not liable to the danger, as in the latter, of types falling out. Above all, the mould may be bent to any curve required, and a circular cast obtained, which may be fastened round the cylinder of a machine (see *infra* in regard to rotary printing).

Process of stereotyping.

The process of stereotyping, divested of merely technical details, is as follows. From a form of matter, which may be wholly or in part composed of movable types, a matrix or mould is taken. The original is in rilievo ; the mould consequently is in intaglio. From this the stereo plate is cast, and it of course is again in rilievo. This in turn may likewise become an original, and casts may be taken from a plate, or other casts from the same mould. The first books were printed from solid wooden blocks, each of which formed a page. Then came the era of typography, in which these pages were composed, mosaic-like, of movable types. Now has succeeded the period of stereotyping, in which pages formed of single blocks—but of metal, not of wood—are used. The two essential parts are, therefore, the making of the matrix and of the cast, which is composed of an alloy something like that for type metal. The mould may be of plaster of Paris or papier-mâché ; the latter being the simplest material, and that almost universally used, need alone be here referred to. The following account of the process, when carried out on the smallest possible scale, is sufficient perhaps to show the general principles of the art. The papier-mâché for the mould, called *flong*, is made by uniting several sheets of paper with a paste made of wheaten flour, starch, and alum, to which whiting is added. These ingredients are often varied ; the general object in using them is to obtain a paste which will stand a high temperature without burning. A sheet of brown paper is laid down on a smooth surface and pasted over ; blotting paper is laid on that and pressed down, then pasted over, and a sheet of tissue paper added, which is also pasted and another sheet of tissue paper placed on the top. This is well smoothed and pressed to give the incorporated material greater firmness and cohesion. Next, to prepare the form for being moulded, it is surrounded with metal "clumps" of the height of the type, placed close to the matter, and then oiled to prevent the flong sticking to it. The latter is then thoroughly damped, to render it quite plastic. The form being on a level surface, the flong is laid upon it, and on that a piece of linen. The surface is next well beaten all over with a long-handled brush, till the flong sinks into all the declivities of the form and receives a deep impression of it. This is a process requiring experience and practice. The linen being removed, a piece of very stout paper is laid on the top, and also beaten down, so as to strengthen the flong, and the moulding is finished. The next point is to dry the mould.

In the most rudimentary method a combined drying and casting press is used. It consists of a flat iron surface, with a lid attached to one end by hinges. Over the surface is a cross-head fitted with a screw ; pressure may be exerted on anything placed between, the arrangement being like that of a screw letter-copying press. The cross-head can be moved to one side when it is necessary for the lid to be lifted up. Underneath the press is a series of gas jets, by means of which the bed plate is heated. The press stands on supports, but is attached to them only by an axle, and it can be readily changed from the horizontal to the vertical position. The lid of the box is raised and the form with the flong upon it placed on the centre of the iron surface. After being covered with a blanket, the lid is screwed down upon the whole, and, the gas being lighted, the form and mould are heated for a few minutes, after which the lid is raised, the steam evaporates, and the flong, which has now become the matrix, is thoroughly dry. In large stereotyping foundries, after the flong has been well beaten upon the form, until the impression of the types is plainly seen on the back, it is baked and dried (the form still underneath) on a long thick iron slab, called a *hot chamber*, because it is heated from within by steam. The matrix is then removed from the form, and any superfluous margin cut away or trimmed ; after this the matrix is dusted with powdered French chalk and is ready for being cast from.[1] A method has lately come into use for obviating the necessity of keeping the matrix on the type while it is being hardened by drying by heat, whereby the type is injured. The matrix is dried separately, being removed when moist from the form, as soon as the impression is obtained. It is then placed on a bed of sand heated by gas. The form is never heated, and there is a great saving of time, because the drying can be done in two minutes. The matrix is laid on the bed of the casting box face upwards, with gauges around it to determine the height or thickness of the cast. The lid is put down and screwed tightly, and the position of the press altered from the horizontal to the upright. The metal is then poured in and the press restored to its former position. The matrix is carefully raised and the plate exposed. It has only to be "trimmed," the superfluous metal cut away, and the back planed, to be ready for mounting on a block of wood to make it type high.

Stereotyping for a Walter press ;

In stereotyping for the Walter and similar presses the process is as follows. The form is laid on the table of the moulding machine and the flong placed on it and thoroughly beaten in by hand or passed through a moulding machine, which performs the same operation. The form is next placed on a heating surface, and when nearly dried the matrix is removed from it and again dried. It is then placed in the casting box, which is curved to the circumference of the cylinder of the press. The box, being on a swivel, is set upright. The metal is now poured in from a ladle and the plate cast. It is allowed to stand a minute and then taken out, still hot, and placed upon a "finishing saddle" of the same circular form as the back of the plate, and secured by clamps and screws. An angular-shaped knife or chisel, fixed in a carriage, is moved by a handle in a semicircular direction across the surface of the plate, in order to remove superfluous portions of metal and to form a bevel whereby the plate can be subsequently clamped on the machine. If necessary the plate may be smoothed at the back by a specially-contrived planing machine. The plate is now ready for being placed on the printing machine. Each single operation can be performed with the utmost possible despatch. If the organization is sufficiently perfect, the time for making a plate, from the moment when the form comes down from the machine-room to that wherein the perfect plate is set on the machine, need only be about eight minutes.

For newspapers.

In newspaper establishments where stereotyping is thus adopted the pages are not all made up simultaneously : some are kept open till the last for the latest telegrams. The moment a page is completed and locked up in its chase it is sent down to the foundry, and as many casts taken as there are printing machines to be set going. One page follows another with rapidity, the first being placed in position on the machine, while the later ones are in the foundry. When all the plates are finished and fixed in their places, six, eight, or ten machines may be simultaneously printing at the rate of nearly 12,000 per hour each. The enormous increase in the circulation of the great daily newspapers would have been impossible but for the extraordinary facilities for rapid production provided by stereotyping. This process is also of special utility to the newspaper printer in the case of telegrams arriving late. In machines which printed from the type, late telegrams could only be inserted by a "stop-press ;" that is, the printing was interrupted while the alteration was being made. But, when the papier-mâché casts of the pages have been taken, the type itself is liberated and sent back to the composing room, so that, if later news arrives while the machines are running, the foreman printer alters the page, a fresh cast of it is taken, and a machine started without interrupting the production for a moment.

[1] These matrices can be preserved for several years, and the stereotyping process postponed until actually required.

The London evening papers have usually five editions, and for every edition fresh casts are made of one or more of the pages.

Celluloid and india-rubber stereos.

Quite recently the substance called celluloid has been introduced instead of the metal referred to previously. A mould is made of yellow oxide of lead and glycerin formed into a semi-fluid paste, which is applied to the surface of the type. The matrix is placed on a powerful press and a heated sheet of celluloid about $\frac{3}{16}$ of an inch thick is laid on it. When pressure is applied, a perfect facsimile is obtained, and it is ready to be printed from when mounted in the usual way. Whereas a good electrotype from a wood block averages six hours in its production, a cast in celluloid can be got in less than an hour. These blocks are very tough and many thousands more of impressions can be printed from them than from stereotypes without their showing signs of wear. For small stamps india-rubber is used as a stereotyping material, and afterwards vulcanized. These stamps, being flexible, print on rough surfaces which would not take an impression from ordinary stereotypes. With a flexible surface, too, much less pressure is required.

Printing by means of punches.

Machines have been invented to do away with the use of types altogther. The principle is to punch the characters successively on some substance which will act like the flong and become a mould from which stereo plates may be cast. In an apparatus recently introduced the flong is a prepared piece of millboard, which is placed in front of the steel punches. The latter are driven into the flong with lightning speed and great accuracy. By turning a handle all the Roman punches are changed to Italic; by another a set of sanserif or other fonts comes into play. For setting time-tables and logarithms the apparatus is said to save ninety per cent. over the ordinary system of hand-setting. The obstacle to the more general use of it is the difficulty of correcting errors. In another machine the punches are driven into a block of teak wood. They are cast to thicknesses which are the multiple of a "point"; hence by a simple calculation they may be spaced out to the exact number of points chosen for the length of the line, and every line leaves the machine justified. The block when complete is removed and a stereotype taken, which can be printed as in the ordinary method of typography.

Electro-typing.

For the reproduction of wood engravings electrotyping has nearly superseded stereotyping, as it produces much better copies. For obtaining plates of type matter it is also better than stereotyping, as many thousands of impressions may be taken without reducing the sharpness of an electro, while ordinary stereotype would be almost worn out by printing a much smaller number. This arises from the superior hardness and toughness of copper, of which the surface of the electro is formed. Electrotyping, however, is costlier and slower.

The form to be electrotyped is placed upon a level plate, and surrounded with type-high clumps or metal furniture, and then floated with plaster of Paris, which prevents the mould of wax (to be afterwards made) from penetrating too far into the interstices of the spaces. The form is next brushed with finely powdered blacklead or plumbago. The moulding composition is made of melted wax, with the addition of a little blacklead. This is poured into a shallow metal moulding tray, to which two pieces of stout wire are soldered, in order that it may be afterwards suspended in the depositing trough. After the composition is cooled and set its surface is brushed with blacklead, and it is then ready for moulding. The moulding press may be something like a letter-copying press, or, in a large establishment, may consist of a powerful hydraulic or other press capable of exercising a pressure of many tons. The form is placed exactly under the centre of the platen, with the moulding tray containing the wax, slightly warm, upon it. An impression is then taken, and the mould afterwards separated from the form. The mould has next to go through the process of *building*, that is, heated wax is dropped upon such portions as should be more deeply sunk in the finished electrotype plate, namely, the places where "whites" are to appear in the print. The mould, having been finished, has to be blackleaded, plumbago being a conductor of electricity, while wax is a non-conductor. The material is well brushed in, filling all the interstices of the form; and the entire surface of the mould must be properly covered, to ensure a perfect deposit of the copper. To facilitate this operation, a blackleading machine is used in large establishments. The form is placed upon a carriage formed of transverse bars and is moved backwards and forwards by a handle and rounce to bring it under the blacklead brush. After the mould is blackleaded, the back of the moulding pan is coated with wax, to prevent the copper from being deposited upon it. The mould is now quickly immersed in one of the compartments of the battery. The process of depositing a copper solution upon the blackleaded surface of the mould is continued until a solid plate is formed, which, though it is scarcely thicker than a finger nail, being about $\frac{1}{32}$ inch, forms, when properly backed, the best and most enduring surface for letterpress printing that has been discovered.

The moulding tray containing the mould is hung on the brass rod of the depositing trough facing a plate of copper, and the connection of the battery made: that is, the mould is attached to one pole of the battery and the plate of copper to the other. The copper, so to speak, is decomposed on the one hand and recomposed on the other: in other words, the current of electricity being complete, and the mould submerged in the sulphate of copper solution, the deposition of copper on the mould at once commences. Here it remains until the deposit is sufficient, the time usually occupied being from 8 to 12 hours, according to the state of the solution and the strength of the batteries. The dynamo electro machine, which is now employed in large houses, very materially reduces this period; otherwise Smee's batteries are generally used. When the deposit, or, as it is called, the *shell*, formed on the wax mould is of proper thickness, it is disengaged from the wax,—the mould being placed with its back on an inclined board, and boiling water poured over the shell, which melts the surface of the wax, except a thin coating, the removal of which is effected by placing the mould and shell on a steam heating table. Thus the wax mould is destroyed, and it is not possible to obtain more than one shell from a mould, whereas the stereotype process enables almost any number of casts to be taken from the same matrix. The shell, being too thin and fragile to be printed from, is next backed, or filled up with metal of a somewhat softer kind than stereo metal. The shell, after being further cleaned, is lowered on to the top of a vessel of molten type metal; and, when the solder previously used to unite the copper and the metal has fused, the latter is poured over it in a molten state until it is covered. The plate is washed, dried, and polished, the back roughly planed to a surface parallel to the front, the edges squared, and all imperfections made good. The thickness of a plate is usually a pica or $\frac{1}{8}$th inch. It is mounted as an ordinary stereotype plate. Within the last few years the process has been greatly facilitated by the employment of specially contrived apparatus, and illustrations can be produced in three hours from the time the mould is made. Curved electros are produced, as well as curved stereos, for use in rotary printing. Facing with nickel by the electroplating process is now largely adopted for hardening stereotypes and electrotypes and rendering them more durable. This process also prevents the deterioration of such plates by the action of the acids or other chemical reagents often present in printing inks, such as cyanide of potassium in red ink and nitric acid in some blue inks.

Polytyping.

Polytyping is a method invented in France about the end of the 18th century, but now seldom practiced in the United Kingdom. The apparatus somewhat resembles a pile-driver. It has two upright guides about six feet high, and a pulley at the top, which elevates by means of a rope a heavy plate, on which the matrix is placed in an inverted position. At the foot of the machine there is a substantial iron bed, upon which the operator places some molten metal. He then pulls the rope until the matrix, with its weight attached, is elevated to the top of the machine, when it is suddenly allowed to fall. The result is similar to that made on a medal by means of a die,—a perfect reproduction of the matrix in relief, which is mounted on a metal stand to type height. The results are excellent, as the plastic metal is forced into the finest lines of the matrix. Duplicates of a block can be thus produced more rapidly than by the ordinary stereotype process; and another advantage is that the intaglio parts are much deeper,—a point of some importance in printing. The matrix may be made from the block by the electrotyping process.

Substitutes for Wood-Engraving.

Process blocks.

Formerly the only available method of obtaining illustrations which could be printed on the letterpress in conjunction with type was that of wood-engraving. At the present time a number of comparatively new processes are in operation, in which the engraving is done almost automatically by the adoption of chemical processes and the well-known principles of photography. Engravings of this kind are called in the trade *process blocks*, or sometimes *zinco-types*, owing to the metal of which they are formed. There is space here for only the barest possible account of the processes.

In the first method, which is sometimes called *typo-etching*, the drawing is made with ordinary lithographic ink on stone, or on paper and transferred to stone. It is then re-transferred to a plate of polished zinc by the ordinary lithographic process. Zinc is employed on account of its cheapness and its ready solubility in the acids used for etching. It has properties similar to those of the lithographic stone in taking up the ink and the water. The transfer is made to adhere to the plate by being passed through a lithographic press; the paper is then stripped off; and the whole of the ink is left on the plate, which is inked up as a litho stone with a view to render the lines as solid and strong as possible to resist the acid. The covering of the lines is strengthened by dusting powdered asphalt or some other suitable material over the plate, which is warmed just sufficiently to incorporate the asphalt with the ink. The plate is next placed in a bath of acid (its back and other parts, where the acid is not required to act, being protected by varnish), in order that the unprotected parts, or those which are to form the whites of the finished picture, may be dissolved away. In order to prevent the acid eating not only straight down into the plate but on the sides of the furrows it forms, and thus undermining them, an ingenious device has been adopted. As soon as the etching has proceeded to a very slight depth, the plate is removed from the bath, washed, and heated. The ink and other protective medium are thus melted and run down the sides of the little furrows formed by the acids and thereby protect them from further action. Inking and dusting with resinous material are repeated, and etching resumed, until the depressions of the block have been brought to the proper depth. The etching is carried on in troughs to which a rocking motion is given, so that the acid flows to and fro in waves over the surface, and little bubbles of gas, etc., are carried away. Where large spaces of white occur, the metal is cleared away by a drill; after the block has been mounted type high, it is ready for the printer.

Typo-etching.

This process is only available for the production of "line blocks," *i.e.*, those in which the original drawing is done in lines or dots, as for an ordinary woodcut. The highest achievement of process blocks has been the production of *tone blocks*, which may be made direct from oil-paintings, water-colors, photographs, drawings in chalk, wash, pencil, etc., or indeed from anything from which a photographic negative can be taken. The exact nature of the process is a trade secret, but the rationale is given in Mr. Truman Wood's *Modern Methods of Illustrating Books* (London, 1887), to which we are indebted for the following details. The problem is to translate, as it were, the light and shade of the negative into solid outlines of black and white. The shades must be lines of various breadths or of various distances apart, or spots or grain of various degrees of fineness or closeness. In a surface-block any part that touches the paper prints, and any part that does not touch the paper does not leave any mark at all. The photographic image is continuous: there are no outlines in it, the picture being formed of graduated tints or shades, ranging from the white of the paper up to the darkest color that the process employed can give. To make a block for letter-press printing the graduated tints of the photograph have to be broken up into [illegible] or grain, and it must be a stipple closest in the shadows, gradually becoming more open through the range of the intermediate tones, and vanishing altogether in the highest lights. To describe the ingenious methods adopted to secure this end would involve an account of several photographic operations which would be out of place here. In one process, perfected by Meisenbach of Munich in 1882, grained negatives are produced by placing a transparent screen, on which a suitable grain is imprinted, in contact with the negative or the positive to be copied, and then photographing the two together. The negative is transferred to a plate of suitable material, which is graved or etched in the usual manner, to form a typographic block. Another device is to print from the original negative upon a piece of silk, the threads of which break up the picture into a regular grain. The positive on the silk is then photographed and a printing block made. These blocks require from their very low relief delicate and careful printing, but are made to give excellent results.

Tone blocks.

A process of typographic etching has been invented by Messrs. Dawson, in which the design is drawn with an etching needle on a brass plate covered with a wax etching ground, in the same manner as for an ordinary etching. The metal is therefore bared at the lines, which are separated by ridges and spaces of wax. These spaces are strengthened by the addition of melted wax, which runs up to the edges of the lines, but does not run over on to them as might be expected, filling them up. The supply is continued until the spaces between the lines, representing the whites of the finished print, have been raised to a height sufficient to give the necessary relief, when an electrotype is taken. This electrotype forms the printing surface.

Typo-graphic etching.

Shank's process is a device for producing pictures simply by the use of mechanism, and is an application of the eidograph. The plate to be drawn upon is moved under the drawing implement, which is a rapidly revolving cutter, and the plate on its carrier is mounted on the end of a series of levers in the same way as the slide rest of a lathe, so as to have motion in two directions, one at right angles to the other, and consequently by a combination of the two to have motion in any direction in the same plane. If a plate of a suitable substance, such as hardened plaster of Paris, be mounted on the carrier, and the bracing point at the other end of the lever be moved over the lines of a drawing, the cutter will plough a little furrow, which will follow these lines. When the plate is finished, a stereotype is taken from it and forms the printing surface. The lines of the casts are remarkably strong owing to the conformation of the furrow of the mould, and they can be printed on fast rotary machines. The weather charts given in some newspapers are produced by this process. A block with the recurring outlines being made, plates are moulded from it, so that the details alone have to be separately cut upon future plates. Mr. Shank's method is remarkably simple and expeditious, and the results are economical and trustworthy.

Shank's process.

Press-Work and Presses.

The characteristic of printing, as already pointed out, is that the pigment—the ink—with which the printing surface of the type is coated is transferred to the paper or other material by pressure. The manner in which this pressure is exerted gives rise to two classes of machinery,—those in which the platen and the cylinder respectively are employed. After the paper is placed on the type, in the one case a flat plate of iron moves parallel to the form and comes in contact with it, causing the impression on the paper, while in the other case a cylinder revolves over the surface, which travels in gearing with the cylinder.

Space does not permit of any sketch, however slight, of the origin and progress of type-printing machinery. We can only refer to what may be regarded as representative appliances in present use. In America all kinds of apparatus for printing are called "presses"; in England, however, an appliance of a more automatic character than the hand-press is usually called "a machine." As the hand-press is now almost obsolete, this distinction will probably be abandoned, and the shorter and more expressive word "press" be applied to all. Venturing to adopt this suggestion, we may say that of platen presses there are the hand-press, the treadle platen press, and the steam or other power-driven press.

Fig. 10 is a view of the Albion press. It is wholly of iron and steel. Although this press is nearly superseded, it is desirable to point out its component parts, as they indicate the general principles on which all typographic machinery is based. The flat plane on which the type is laid is called the *bed* of the press; the other flat plane which moves vertically and presses the paper on the type is the *platen*. These are the two essential parts of the press. The platen is perfectly smooth and level on its under surface, in order to give the whole of the type form an equable pressure. It is mounted in a strong iron frame, with a cross-piece or head. The platen is propelled by a piston, which moves up and down. The power is gained by bringing an inclined bar of steel perpendicular to the direct line of pressure, and in doing so the piston is forced down. This steel bar is the *chill*, shaped like an elbow. At one end is a bar or handle which, on being pulled towards the operator, straightens the chill or brings it into the vertical position. At the sides are guide-plates fixed into the frame, to preserve the parallelism of the platen, for the slightest vibration or lateral movement would prevent a clear sharp impression being taken. There are appropriate appliances, such as a helical spring, fixed on the head of the press, whereby the platen raises itself when the pressure is not required. In order to bring the form readily under the platen, and to withdraw it so that it may be inked and the sheet to be printed placed in position, the table is mounted on a carriage, that runs on two rails by turning a handle connected with two endless bands. The paper is fixed to certain marks on the *tympan*, a kind of metal frame hinged on to the carriage, when it is in a sloping position. This ensures the paper being printed in the exact place required. The tympan, over which calico or parchment is stretched, is double, and contains within

Hand-press.

it a pad of paper or a piece of blanket, to moderate the force of the impression of the platen. To it is hinged another metal frame, the *frisket*, which is covered with paper, cut to correspond with the shape of the type form on the press. The ink is applied with a cylinder or *roller*, which revolves in an iron frame, and is covered about an inch thick with a composition of glue and treacle or of glycerin or other substance. The ink is spread out with a palette knife or similar appliance on a table adjoining the press, and by repeatedly revolving the roller over it, it becomes coated with an extremly thin film of ink. The roller is then moved over the surface of the form on the press, until sufficient ink has been transferred to it. This is called *rolling*, and is a very important part of press-work, for if inefficiently performed there will be too much ink on the impression, or even blotches, which are called *monks*, or the print will be too pale or gray in places, such imperfections being called *friars*. The sheet of paper to be printed is next laid on the tympan, to pins serving as guides. The frisket is folded down on the tympan, which is in turn folded down on the form with the right hand, while with the left the handle is turned and the press carriage brought under the platen. The bar is pulled by the right hand, the handle turned the reverse way with the left hand, the carriage brought out again, the tympan raised, the frisket opened, and the printed sheet removed, the tympan being ready to receive another white sheet. The frisket serves, among other things, to keep the edges and parts of the sheet not required to be printed from being discolored by contact with the ink or the sides of the form, and to aid in steadying the sheet when the tympan is depressed and in the removal of the sheet when it is raised.

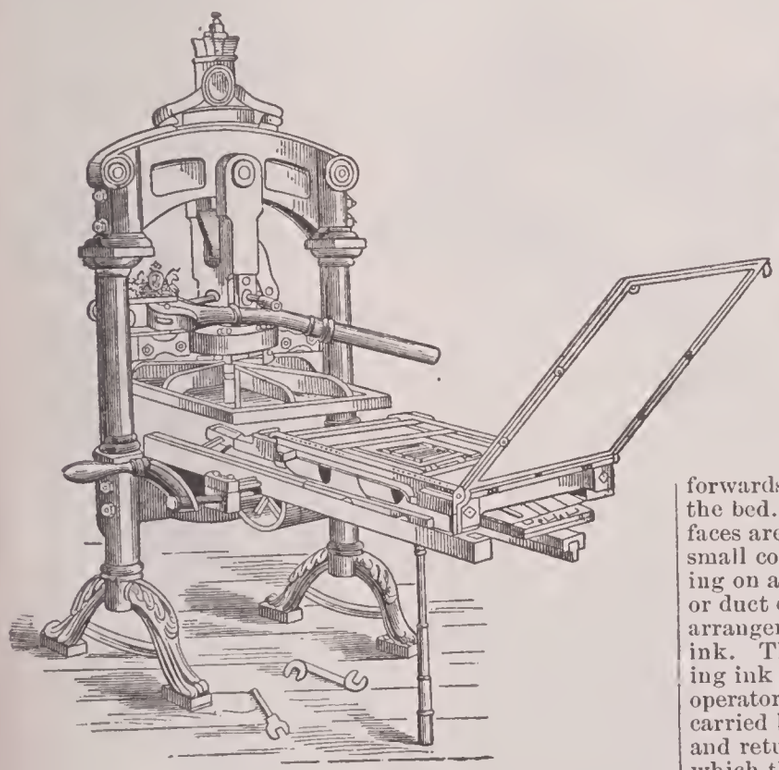

Fig. 10.—Albion press.

Such is a bare outline of the method of printing at a hand-press,—one necessarily imperfect from a technical point of view, but sufficient to indicate the essentials of the operation.

Another press which has been much used is the Columbian,—a name given to it by its inventor, Clymer, an American. The power is gained by an ingenious combination of levers. Two of these are connected by a rod with the bar handle, which is in itself a lever. The platen is attached to the head by a strong iron bolt, the descent being made steady and regular by vertical guides. It is counterbalanced by a powerful lever or beam, having an adjustable weight shaped like an eagle, which raises it automatically. In the bar handle is a screw stop by means of which the length of the lever rod can be adjusted and its pressure, or the *pull*, perfectly regulated.

Nine distinct processes have thus to be gone through in order to print one side of a sheet of paper at a hand-press: (1) inking the roller, (2) inking the form, (3) laying the sheet on the tympan, (4) folding down the tympan, (5) running in the form under the platen, (6) taking the impression by depressing the platen, and then immediately afterwards allowing it to raise itself by means of the counterpoise or spring, (7) running out the form, (8) lifting the tympan and frisket, and (9) removing the sheet. The object of successive improvers of the printing press has been to render the apparatus more automatic, or to substitute for it a "machine" that will reduce these nine operations to the minimum. In modern machines this has been effected to the extent of rendering necessary only three of them—(1) laying on or "feeding" the sheets, (2) applying the motive power, (3) taking off or delivering the sheets; and rotary machines both feed and deliver themselves automatically. Nearly all cylinder machines have a delivery apparatus, and quite recently an appliance for the automatic feeding to them of single sheets of paper has been invented.

With respect to the platen press we notice first that which is capable of being driven by a rotating shaft or wheel. It should be observed that the adoption of the rotatory principle was essential to the acceleration of speed. This was recognized by the projector of the machine[1] press, William Nicholson, and by Frederick Koenig, who first brought the invention into use and constructed a practical press. The essential arrangements of every machine are four, their respective objects being (1) to feed in the paper, (2) to ink the form, (3) to print the sheet, and (4) to deliver or to take it off.

Treadle platen press.

The treadle platen press is the simplest of machine presses capable of being worked by a wheel. When other motive power is not available it is driven by a treadle, like that of a lathe. The type form is usually secured by clamps on an almost vertical bed (Fig. 11), and the platen rocks backwards and

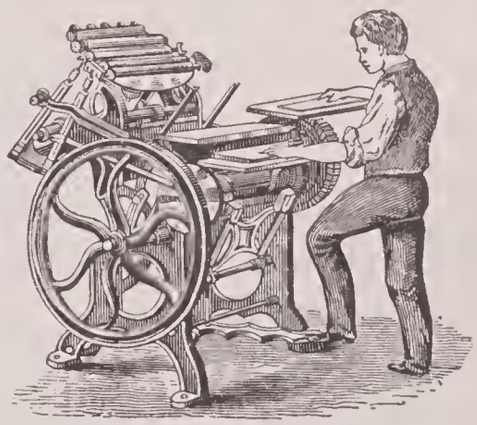

Fig. 11.—Minerva press.

forwards, being thus brought in contact with the type on the bed. Just before the impression is taken, the two surfaces are momentarily parallel. The inking is effected by small composition rollers, adjusted in a roller carrier swinging on a pivot. The rollers receive ink from a "fountain" or duct of ink at the top of the machine, below which is an arrangement, such as a revolving disk, for distributing the ink. The constant motion of the rollers and of the revolving ink disk is equivalent to the manual movements of the operator who "rolls" at the hand-press. The rollers are carried by self-acting appliances over the face of the form, and return to the ink table to be replenished with ink, after which the impression takes place. The sheet to be printed is placed in proper position on the platen, which is covered with paper or parchment, and is secured there during the movement of the platen by movable fingers called *grippers*. The platen on advancing brings the paper in contact with the type form; after the printing it returns to its original position, when the sheet is removed and another sheet adjusted ready for being printed. The treadle platen press is only adapted for work on paper of small size, up to half sheet demy, but within this limit it is greatly superior to the hand-press. If sufficiently strong and well built, it gives a far more powerful impression, and it occupies about a sixth of the space. Its great merit, however, is its superior speed. The hand-press, when worked by two men, one rolling the types and one pulling the handle of the press, produces only about 250 impressions per hour. The treadle press is worked by a boy, who has only to depress the treadle with his foot, and lay on and take off the sheets with his hands, and he

[1] The best account of its invention is contained in a series of articles by Mr. William Blades in the *Printer's Register*, 1883-84, and Th. Goebel's *Friedrich Koenig und die Erfindung der Schnellpresse* (Stuttgart, 1883). This last has been translated into French by Paul Schmidt, *F. Koenig et l'Invention de la Presse Mécanique* (Paris, 1885).

can work at the rate of more than 1000 per hour. The treadle press is also superior to the hand-press in the uniformity of its results, since the automatic inking insures a greater regularity in the color of the impressions than with the old hand-inking process.

Double platen press.

The ordinary or "double" platen press was, in principle, very similar to the hand-press. It was about 13 feet long. The platen, in the centre, was massive, as the machine printed sheets as large as double demy, and it had a perpendicular motion, being guided in grooves and worked by a connecting rod fixed to a cross beam and crank, which acquired its motion from the main shaft. In other respects the machine differed from the hand-press in having two type beds or coffins and two inking tables arranged at the ends of the carriage, which travelled backwards and forwards, being worked by a drum underneath. The paper to be printed was laid to marks on the frisket, and this was hinged on the tympan, which in turn was fastened to the end of the coffin by hinges or joints. The frisket and tympan were opened by running up bars at suitable positions. After a newly printed sheet was removed, another was placed on the frisket, which as the carriage moved ran down the bars and closed on the sheet, which then received its impression. This arrangement was dangerous to the boys who had to lay on the sheets.

Formerly it was thought that the very finest printing could not be done by a cylinder impressing a form in the progress of its reciprocating motion, for that was liable to slur or blur the impression. Hence platen presses were employed for the best work. Of recent years engineers have brought the cylinder press to such perfection that there is not the slightest danger, under the superintendence of a capable man, of any slur. Working quite as well as the platen press, the cylinder press is enormously quicker and more productive; it requires less driving power; and much better inking is obtained, which is all-important for fine woodcut printing. Accordingly, for even the best illustrated book-work, the platen power-press is now almost entirely superseded by the cylinder.

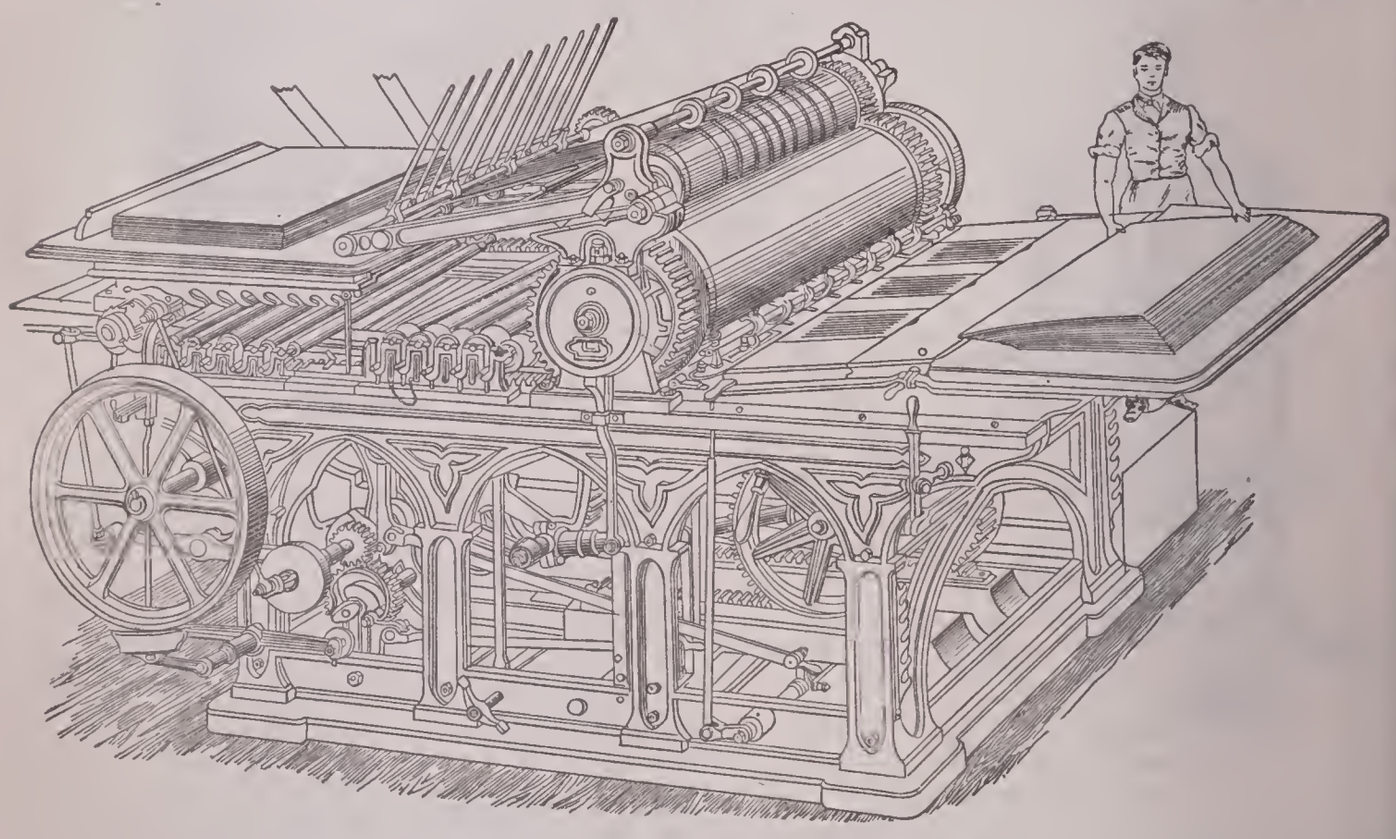

Fig. 12.—Extra color Bremner machine, with sheet-flyers.

Cylinder machines are of two kinds,—(1) presses in which the type is on a flat plane and (2) those in which the type, or more correctly the impressing surface, is cylindrical. The first are called *cylinder* presses, the second—a development of the first—the *rotary* web presses.

Single-cylinder press.

The simplest kind of mechanical press is called the single-cylinder or one-sided machine, which has been recently brought to the highest state of perfection by Mr. Samuel Bremner. It is generally used for commercial and fine book-work on one side of the paper. There are different varieties of cylinder machines, distinguished by trade-marks or the names of their makers; but the general principles, apart from details, are practically identical. There is a strong cast-iron frame, with bearings to carry the cylinder, which runs across the machine transversely, nearly in the centre. The cylinder revolves by gearing connected with a main shaft, which also works the other moving parts. This shaft is turned by a wheel for hand or steam power. The table for carrying the type is also provided with a flat inking board of wood or iron, used for distributing the ink. It travels backwards and forwards, that is, with a reciprocating motion. At one end of the machine is the *feeding-board*, on which the pile of paper to be printed is placed. The layer-on places each sheet against metal marks, consisting of rectangular pieces of steel or brass mounted on a bar underneath, which rises and falls according as the sheet is being laid to and taken away from them. When placed against these marks, ensuring correct "lay," the sheet is seized by grippers or light metal claws fixed on a bar inside the cylinder. These clutch the sheet and carry it forward round the cylinder, which in its revolution brings it forcibly in contact with the type form moving forward underneath, when the impression is effected. Immediately after the grippers release their hold, and the sheets are removed singly by an attendant called a *taker-off*, or by a mechanical automatic arrangement called a *flyer*, and deposited on the taking-off board. At the end of the machine farthest from the laying-on board is fixed a trough, which contains the ink; it is fitted with the *duct roller* of cast-iron, which revolves by means of a band or ratchet-wheel and pawl. A flat bar or knife with a thin edge is set up against the metal roller lengthways by adjusting screws, which regulate the passage of the ink, and permit a thin film to pass the knife. A composition roller, called a *vibrator*, is fixed underneath, which takes off the ink that has already been deposited on the duct roller and leaves a ridge or strip of it on the inking slab. As the carriage returns, this strip of ink is distributed on the inking table by rollers placed diagonally across the machine. The diagonal position gives them a waving motion; hence they are called *wavers*. The inking of the form is done by another set of rollers called *inkers*, placed near the impression cylinder. The inking rollers receive their ink from what is distributed on the table and coat the type while it is passing underneath them.

Advantages of single-cylinder machine over hand-presses.

Thus the nine operations of the hand-press requisite to print one impression are greatly reduced. The bed carrying the type to and fro from the point of impression moves mechanically, superseding the running in and out of the carriage by the rounce and handle of the hand-press. The inking table, although independent, forms part of the type table, and some of the rollers distribute and others ink, this again being done mechanically

and without a second operator. The platen and the tympan, as well as the levers by which the impression is given, are in effect combined in the cylinder, which rotates by gearing, the pressure being applied during the motion of the table itself. The laying-on of the sheet upon the tympan and folding it down on the form are superseded by the presentation of the paper to the grippers; and the taking-off of the sheet after raising the tympan is superseded by removing it when released by the grippers and laying it on the adjacent table,—both immeasurably easier operations and done much more rapidly. Indeed both laying-on and taking-off may be done automatically, as is explained below. The result is that, while two men are required to print a sheet of book-work on one side of the paper at the speed of 250 an hour at the hand-press, machines of this class worked by one operator print about 1200 per hour. Even this comparison does not convey a complete idea of the enormously increased productiveness of the cylinder machine over that of the press. By the latter, the largest sheet practically that could be printed was double demy, 23×35 inches, the superficies of which is 805 square inches; single-cylinder machines are now made to print eight sheet double crown, the superficies of which is 4800 square inches. These sheets being afterwards cut up into double crown sheets, the productiveness of the machine to the press would be, per hour, about 8000 to 250.

As already mentioned, a self-acting feeding apparatus has been invented for supplying single sheets to cylinder machines. The pile of paper is laid on a feeding board or table, between gauges. A pneumatic tube takes up one sheet at a time; it is then run down tapes to a point at which india-rubber fingers bring it to the side lay of the machine, and it is printed with perfect accuracy of register. Once started, the machine works automatically, and the services of both layer-on and taker-off are dispensed with.

Perfecting presses.

We may now describe that class of machines by which the paper is printed on both sides, or perfected, during one passage through the machine. The Applegath and Cowper or ordinary machine has two impression cylinders, having a continuous rotary motion towards each other. The frame is necessarily long, usually about 15 feet, and the width of the machine about 5 feet, these dimensions depending upon the size of the sheet to be printed. The table or carriage is double, containing two beds for the two forms of type, to impress the two sides of the paper, and two distributing tables for the ink. At each end is a complete roller apparatus, consisting of duct, duct roller, vibrator, and wavers Close to the large cylinders on each side are the inking rollers. The table has a reciprocating motion, as in a single-cylinder machine. The distinctive feature is the ingenious manner in which the sheets are printed first on one side and then on the other. This is effected by carrying them over cylinders and drums by means of tapes. The pile of sheets stands on a high table placed at one end. The sheet is fed into the apparatus and led round an entry drum; thence it is carried round the large right-hand impressing cylinder, and underneath this, on the table, which is moving at the same speed as the cylinder, is the inner form properly inked. The paper thus receives an impression on one side. It is next led up to the right-hand drum, which it passes over, the printed side of the sheet being then downwards. Continuing, it is brought under the second or left-hand drum and on to the left-hand impression cylinder, which it passes with the printed side still downwards, or next to the cylinder, exposing the other side to the type of the outer form on the table underneath. The drums have thus reversed the position of the paper: the side which was outside when passing the first form is inside when passing the second form, which accordingly prints the sheet on the opposite or blank side. The sheet is finally run out by the tapes and delivered in the space between the large cylinders, seized by a taking-off boy, and deposited on a table or taking-off board. This press is known as the *drop-bar perfecting machine*, owing to a peculiarity of the arrangement by which the paper is conveyed into the tapes. In front of the feeding table is a rod or bar of steel, along which are fitted several metal disks or bosses about half an inch thicker than the bar itself. These can be shifted, by means of small screws, to any position along the rod to suit the size of the sheet to be printed. To this bar is fixed a short arm, with a pulley at the end, which works round a wheel attached to a cam with a dip. Every time the pulley drops into the dip, the bar descends upon the paper, which is laid to marks at the front; and the bar, possessing a rotary motion from the tapes, runs the sheet between a roller and a small drum on to the inner form cylinder, as already stated. Other kinds of machines are distinguished as the web, having a web or a series of broad tapes which lie on the laying-on board and are fastened to a small drum underneath it. The drum has a series of small cogs, and when it is forced forward it moves the web or tapes in the same direction. The sheet, having been laid to a back mark on the tapes, is propelled between two revolving rollers and thus taken into the machine.

There are several distinct types of perfecting presses in use, but we can only notice one or two. In the Anglo-French machine, which was invented in England but improved in France, grippers are used instead of tapes and the intermediate drums for conveying the sheet from one cylinder to the other. The cylinders are on a level, but alternately rise and fall, allowing the sheet to clear the form. Quite recently a single-cylinder perfecting press has been invented. The cylinder is double the usual size and has two printing surfaces and a double set of grippers. Two sheets are printed at each revolution, the first being the white paper and the second the partly printed sheet which has immediately preceded it. The sheet is fed in as to an ordinary single side press, printed on one side, taken off, reversed, again gripped, and perfected, when it is automatically delivered on the table.

It has been mentioned that 250 sheets or a *token* per hour, printed on one side only represent the work of two men at the hand-press. Two youths at a perfecting machine will

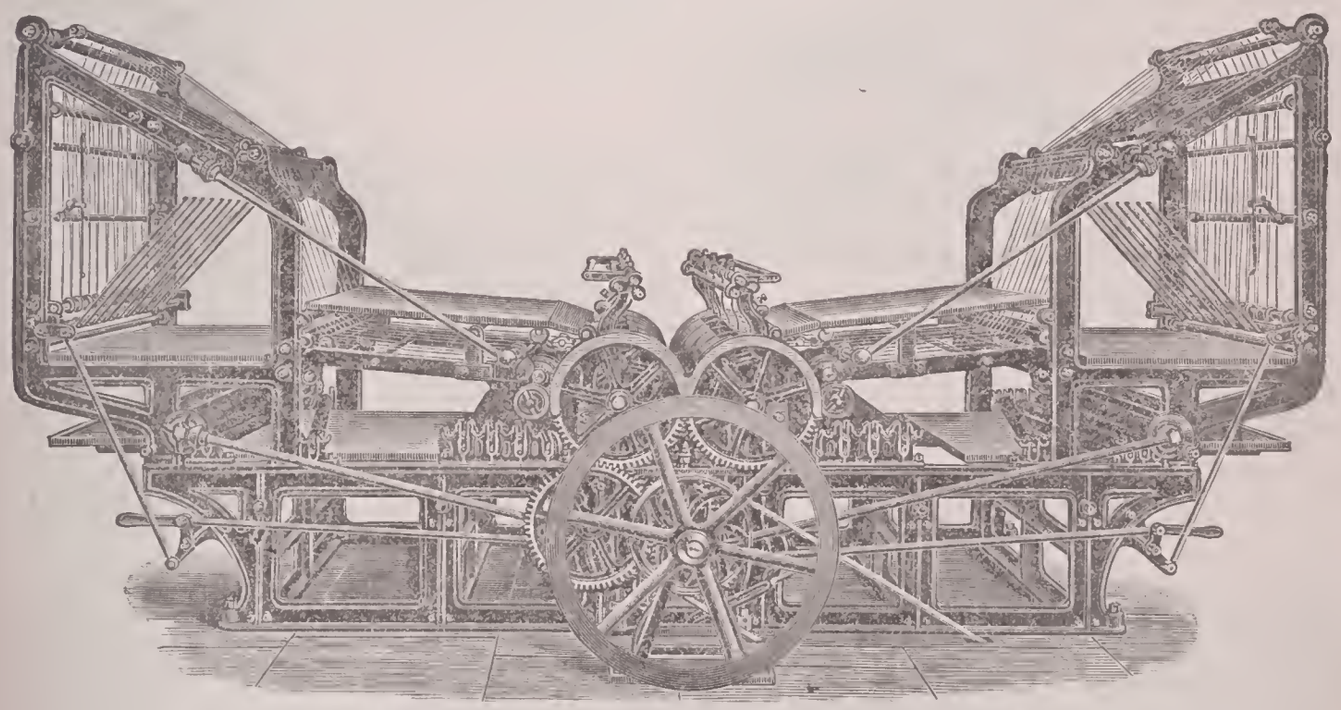

FIG. 13.—Marinoni combined perfecting and duplex single-cylinder machine.

complete from 1200 to 2000 copies per hour, equal to 4000 impressions on one side only,—an increase of about sixteen-fold. This, however, does not represent the whole of the superiority of these machines. Sheets much larger than double crown (20 × 30 inches) can hardly be worked at a press; the machine perfects a sheet nearly double this size —50 × 40 or four royal, so that the proportionate product of the machine to the press is about as 32 to 1.

Perfecting machines are not so much used for book-work as formerly. The single-cylinder machine has been brought to such perfection, and is so superior in its inking arrangements, that printers prefer it. In America nearly all machines are one-sided. For newspapers of limited circulation, however, the perfecting machine is well adapted. Complete copies of a journal are produced as soon as the machine is started; extra copies can be worked off while news-agents are waiting and a number of sheets need not be printed off on one side to be completed when a sudden demand arises.

Fig. 13 shows a new form of French perfecting machine for printing book-work, the Marinoni combined perfecting and duplex single-cylinder machine. The improvement in this machine over the perfecting two-cylinder machine described above consists in the alteration of some mechanical parts, so that the same machine can be used for printing sheets either on both sides or on one side only. It therefore serves the purpose of two single-cylinder machines or of one perfecting machine, the change from one to the other being very simple.

Rotary press.

The rotary press differs essentially from the cylinder machine. In the former the printing surface and the impressing surface both rotate continuously, and the paper, not cut up into single sheets, but carried between the two cylinders in a roll or web, like a ribbon,—receives successively an impression on each side, after which it is cut up into sheets of the proper size and folded as it is run out, the sheets being deposited on a table ready for removal.

Walter press.

As representative of this class of machines we may take the Walter press, whose mechanical arrangement is shown in Fig. 14. The paper to be printed from, a continuous web about 8000 yards in length, is wound on a small roller at *P*. It is passed over a tension roller, and then over the damping cylinders *W*, *W*, and thoroughly wetted on both sides. The damping cylinders are hollow, and contain sponges from which the water is distributed by centrifugal force, the outside of the cylinder being covered with blankets. The paper next passes on to the printing cylinders *T*, *T'*, on which the printing surface—not composed of movable types but of stereo plates—is fixed, and to the impression cylinders *I*, *I'*. The printing cylinders contain each the plate in curvilinear shape, constituting the form for one side of the paper. The web is led between the printing and the impression cylinders, as shown by the dotted line. After being printed on one side by *T*, it travels round *I* and receives an impression on the other side from *T'*, thus being "perfected." It then passes on to the cutting cylinders *K*, *K'*, one of which has a serrated knife, which enters the paper, and on the application of tension divides the web, causing the peculiar saw-like edge seen in copies of journals printed on rotary machines. The paper is next carried in over tapes to the point where the complete severance takes place. Soon after they encounter a pendulous frame, which delivers them in two piles on to the tables *x*, *x*, whence they are removed. There is an ink supply trough *a*, which is connected with the distributing rollers by a revolving metal roller *b*. The distributing rollers of metal are marked *f*, *g*, *h*, *i*, and the rollers which ink the form, made of the ordinary composition, are marked *k*, *k*.

The average rate of speed of the Walter press is 12,000 per hour, the sheets being printed on both sides. In this apparatus everything is automatic: there is self-feeding and self-delivery, the web of paper at one end being transformed into properly printed single sheets at the other. The machine requires only one man to superintend its general working, including the replacing of the web when printed and the removal of the successive piles of sheets. In respect of speed, if the perfecting machine is to the hand-press as 32 to 1, the rotary will be to the hand-press as 96 to 1. The Walter press, requiring a space of only about 14 feet by 5, is not more remarkable for its speed and economy than for its simplicity of construction and its compactness And the same remark applies to several other machines, such as the Victory, the Hoe, and the Prestonian, which have since come into use. Their general appearance is that of a collection of small cylinders or rollers, through which the paper seems to fly at railway speed, issuing forth in two descending torrents of sheets accurately cut into lengths. Without such machinery the prodigious issues of some of the morning journals would not be possible. One daily paper averages a circulation of more than a quarter of a million. This enormous number of sheets is printed in about four hours, owing to the type matter being stereotyped and placed on several presses.

Printing from webs of paper.

Printing from webs of paper instead of single sheets will probably be adopted in the future for all newspapers and even books of large circulation. Hand-feeding is limited by the ability of the operator to lay the sheets on the feeding-board with the necessary accuracy. One chief obstacle to the more general adoption of rotary printing is the expense of stereotyping the type forms. Although a machine has been constructed in which movable types can be placed round the periphery of an impressing cylinder, it cannot compete with the Walter and other presses using stereo plates. The problem of printing directly from flat forms of ordinary types, as well as from stereotypes, with paper supplied in the roll, is one that may be commended to engineers. The saving in stereotyping in many cases would be very considerable; but, even where this is not an object, the readiness and ease with which the type could be manipulated would ensure for such an apparatus admission into offices where the large rotaries of the present day are inadmissible. It would also enable illustrated journals to be printed from the web. The pictures introduced into some of our daily journals are very rude when compared with those in periodicals printed on flat-bed machines. This is owing partly to the distortion that arises when the cast from a flat block is accommodated to a curved surface, partly to the fact that stereotyping does not give the fine and delicate reproduction that electrotyping supplies, and partly to the imperfect inking powers of the machines. Quite recently a plan has been patented whereby curved electrotypes of pictures can be fastened to blank or depressed portions of an ordinary curved stereo plate; but the method is not

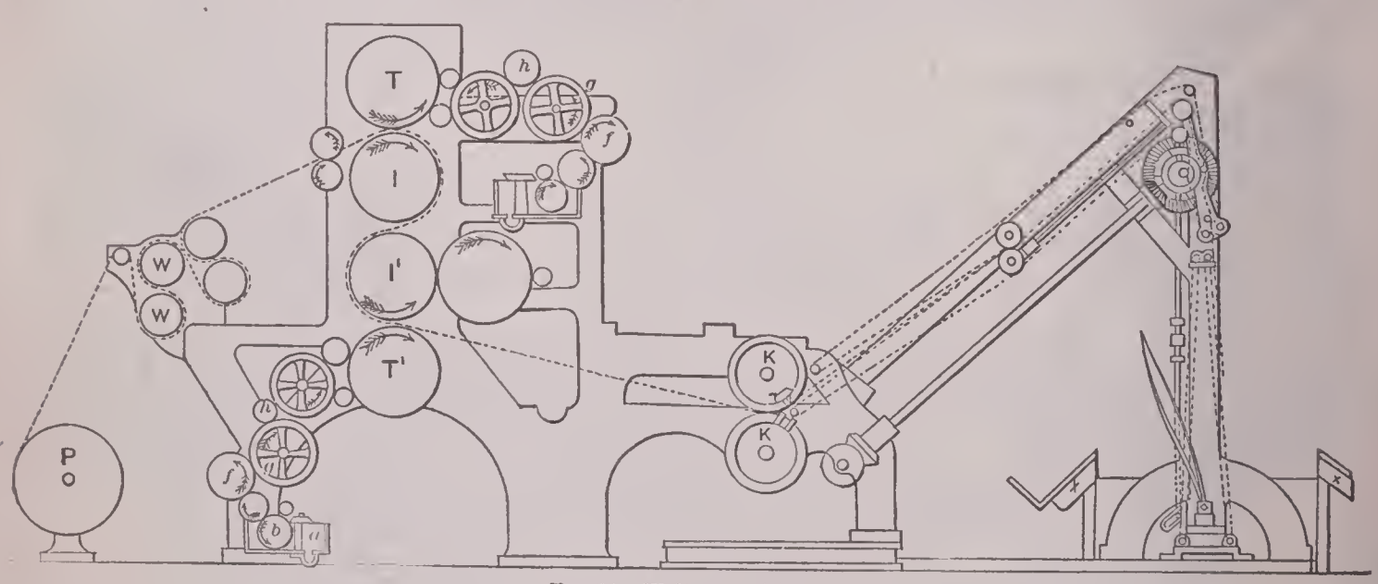

Fig. 14.—Walter machine.

always practicable. With a flat-bed machine the form to be printed from might be of a composite kind,—partly movable types, partly stereotype, and partly electrotype. One difficulty of constructing a web printing machine with a flat bed is that of turning the sheet so that it may be printed almost simultaneously on both sides. It would have to be reversed by the continued rotary movement of the cylinder. This, however, is quite within the limits of practicability, and experiments are now being made to devise a machine with this feature.

Roller composition.

For about three centuries after the invention of printing the forms were inked by leather balls. When machine presses were introduced, their earliest inventor tried to use cylinders covered with leather; but the plan was most unsatisfactory, until a subsequent inventor adopted a composition of glue and treacle, which was cast into cylinders having an inner "stock" of metal or wood. For about half a century this composition was used exclusively for both hand and machine presses. Since then glycerin has been introduced for roller making. Hansard's recipe, in use when the 8th edition of the present work was issued, was—glue 4 parts, treacle 12 parts, Paris white 1 part. But a much better composition is now formed of glue 10 parts, sugar 10 parts, and glycerin 12 parts. The glycerin has the property of always keeping the roller moist and soft, while the tendency of glue and treacle is to dry and harden. A glycerin roller lasts much longer than one of glue and treacle.

Qualities of printing ink.

Printing ink has peculiar qualities. It is required to change from the soft adhesive state in which it is applied to the type to that of a perfectly hard and dry substance after being transferred to the paper. This change of condition must be under control, and when air is excluded the ink should keep in good order any length of time. During its application to the type its solidification should be as slow as possible, and unaccompanied by the emission of any unpleasant or deleterious odor. It ought not to affect the rollers, and having been applied to the paper, its action should be confined to a very slight penetration, just sufficient to prevent its detachment without injuring the surface of the paper. It must dry into a hard, inodorous, and unalterable solid. The ingredients of ink are burnt linseed or other oil, resin, and occasionally soap, with various coloring matters; that for black ink is usually lamp-black, but charcoal and other cheaper materials are occasionally introduced. Ink is removed from types and blocks by detergents, such as potash and pearlash; benzine is also well adapted for the purpose.

Color Printing.

Printing in two colors.

The apparatus previously described is intended for monochrome printing, whatever be the shade of the ink. When two colors or more have to be printed in one composition, there must be a separate type form or separate engraving, and a separate printing for each. Many attempts have been made to print several colors simultaneously by dividing the trough or manipulating the rollers. All these have been more or less unsuccessful, with the exception of a press invented by Mr. W. Conisbee, which prints from type forms in two colors. In construction it is somewhat similar to the ordinary single-cylinder machine, but is provided with two sets of inking apparatus, including ductor, wavers, and inkers, each of which acts totally independent of the rest. The cylinder is placed in the centre of the machine and makes two continuous revolutions, giving an impression for each color. There are two type forms, each containing only the lines to be worked in one of the colors. These are in two beds adjoining one another, and, the circumference of the cylinder being equal to the length of one bed, one color is printed by the first revolution and the other by the second. The sheet is thus printed twice without being released from the grippers, whereby perfect register is ensured. The speed is slow, averaging 300 to 400 complete impressions per hour.

Chromo-typography.

The method by which the beautiful colored supplements issued occasionally with illustrated newspapers are printed may be slightly referred to. A copy of the artist's painting is first of all made, on a scale regulated by the size of the reproduction. This being supplied to the engraver, an outline or key block is made and proofs pulled. It is now necessary to determine the tones of color to be used,—a process demanding great experience. The key block will, if printed first, afford a guide for the registration of the subsequent printings; sometimes, however, that is reserved for a later stage. The colors on which the subsequent printings are done must be of a transparent nature. The blocks are sometimes produced by the typographic etching process, which gives a softness, delicacy, and variety unattainable by the graver. The blending of the colors is the most delicate task the printer has to undertake. A large picture is often printed in ten or more workings, some of them in their turn intensifying and bringing previous color workings into stronger relief, others giving shape and form to the picture. Almost to the end of the process, however, the picture will want vitality; its outlines will be hard and bare, or vague and undefined, according to the sequence of the colors. Another working may give gray tones where wanted, and may increase the depth and transparency of various parts. A deep flesh working may have a marked effect on the development; and, near the close of the series, if the entire coloring is found to be too warm, it may be corrected by overprinting very nearly the whole subject. Chromo-typography has undoubtedly made great strides during the past twenty years, its best results being shown in the colored prints for illustrated journals. For the production of pictures for commercial and artistic purposes chromo-lithography is generally resorted to on account of its relative economy. In lithography for typographic purposes the line has to be cut and the space on both sides removed so as to leave the line alone to be charged with the ink, or the white space has to be etched away with an acid. The printing of isolated points too is easily effected from a stone, whereas most minute labor is necessary to engrave them. Typographic etching has here, however, been of great assistance. The differences of printing surface caused by the colors are met and overcome by the lithographic stone with great facility, even when the spaces are largest and most uneven; it is quite the contrary in regard to typography, wherein the work has to be charged with ink to a greater extent according to its size, and the quantity of ink requisite varies with the fineness of the strokes and of their distance apart. Owing to this we see in most letter-press poly-chromatic prints a deficiency of transparency, of half-tints, of depth of ground, and of general harmony. Even if it were possible to make chromo-typography as easy as chromo-lithography, there would still be the obstacle of its very much greater cost, owing to the expense of the engraving and of the casts from the key block. In chromo-lithography the designer can repeat the designs for the different stones by a process that costs almost nothing. Also in the process of multiplying the blocks the deviation in the register of the successive colors is practically unavoidable. In lithography the surface to be printed is nearly level; hence the sheet is not shifted and twisted or stretched in places, as it is in typography, owing to the alternate closeness and absence of contact between the sheets and the raised and depressed surface of the block. Whatever success the letter-press method has attained of late is owing to the invention of electrotyping and process blocks, and to the improvement of machinery. For to print these pictures enormous strength and rigidity, and the most perfect arrangements for securing register, are absolutely essential.

Chromo-lithography.

Recent Changes.

Progress in Printing.

We will now give a cursory glance at the changes that have been effected during the last twenty-five years in the processes and the products of the art of printing. The hand-press has been almost completely superseded by the machine press. Cylindrical impression has displaced platen impression, and the finest book-work and woodcut work are done on a cylinder press. In book-work, indeed, other significant changes have taken place. Whereas formerly it was deemed essential that the paper should be damped before printing, in order to get a delicate and perfect impression, some of the finest books and periodicals are now printed on dry paper, highly calendered, even the illustrated journals and some of the evening papers being so worked. Then, it was thought necessary for the safety of the type to interpose a thick soft blanket between it and the pressing surface, whether cylinder or platen; now, it is found equally safe, and far more conducive to a good impression, to make the packing as thin and hard as possible. Then, fine woodcuts were "brought up" by the use of many "overlays" and "underlays" to correct inequalities in the surface of the blocks and emphasize some of the parts; now, although the art of "making ready" has been brought to great perfection, the fewer and thinner the overlays employed the better. And it may not be irrelevant to point out that the printing of woodcuts has improved in the same degree as the engraving of them.

Perhaps, however, the most remarkable change is that made in newspaper printing. The highest achievement mentioned in the article "Printing" in the 8th edition of this work was the six-cylinder Hoe machine. The makers of that apparatus subsequently contrived machines of eight and ten cylinders. But they have now been wholly superseded by the rotary presses on the Walter principle. The hand feeding-in of single sheets is entirely done away with, and all newspapers of considerable circulation are printed from long reels of paper, uncut, as originally made at the paper-mill. The maximum number of copies which a machine of this class would print with ten feeding attendants and four taking away attendants would be 8000 an hour. For folding the 8000 printed copies five folding machines and at least two attendants would be required to keep pace with the printing machines. Thus nineteen men were required to print and fold 8000 copies per hour with the best machines as late as 1870. With a rotary machine doing the same or a larger quantity of work only two men are required. The cost for printing and folding 1000 copies by the Hoe machine was estimated at 1s. 4d., while with the rotary it is only about 2d. Hence the saving of wages to a newspaper issuing 200,000 copies a day on 313 working days would be nearly £3700 in a year. This, in connection with improvements in paper, or rather the discovery of cheaper materials, bringing the price of "news" down to about 2d. per lb—one quarter of its price a very few years ago—accounts for much of the enterprise of modern journalism. For some time after the abolition of the paper duty there was a loss on the circulation of a large-sized penny journal; now there is a considerable gain. Lately rotary presses for small jobbing work have been constructed; and before long the rotary principle will probably be rendered available for illustrated periodicals and fine book-work, printed from webs or reels of paper instead of single sheets. Great improvements have also been made in type-founding, and the Roman and Italic fonts now used by English printers are equal to those of any country in the world. It is sometimes said that English *éditions de luxe* are not equal to those of the French, and that this is owing to the inferiority of the founders. This is, however, not quite true: some of the best French books are printed from English types or from types cut in the English manner. It is also the fashion to compare modern printed books with those of the Elzevirs and Baskerville. Yet as a matter of fact their best faces have been reproduced with perfect success by modern founders. From a mechanical point of view the impression given by the best machine presses to-day is undoubtedly superior to that of the hand-presses of the 17th and 18th centuries. If modern books suffer in any respect on comparison with those of former times, which are so highly prized by bibliophiles, it is owing to their want of general artistic *ensemble*, and not to any deficiency in mechanical execution. The artistic taste of English printers has, however, been greatly raised during the last few years, and a very interesting movement is going on which must produce important results in the future. In 1880 Mr. Andrew W. Tuer of London organized the Printers' Specimen Exchange, a scheme intended to promote the technical education of the working printer. Each contributor to the exchange furnishes periodically a certain fixed number of typographical specimens, all alike, which are collated into sets, and again distributed to the members, each of whom gets a volume, consisting of one copy of the work of each of his fellow-contributors. By this plan they become acquainted with the progress made by their brethren, and good taste and good work are fostered and mutually encouraged. The eighth quarto volume, issued in 1887, contains nearly 400 fine specimens of typography by as many different hands. It forms also the best criterion of the character of the jobbing work done at the present day, not only in England but abroad, for the scheme is of an international character. The results of the revival in artistic printing during the last decade are especially noticeable in jobbing work. Much of this improvement is due to the superior material with which the printer is furnished, and especially to the great variety of ornamental types which have been introduced. The specimen books of the principal type-founders are splendid volumes, containing several thousand different faces. The best work of German printers is noteworthy for its studied neatness and attractiveness, tasteful and harmonious arrangement of colors and tint, a characteristic and conscientious attention to details of finish, exact register, and beauty of impression. American work excels in originality of design, brilliancy of color, and perfect finish. English printers are closely following the best points of each of these schools of typography. There is a distinct leaning at present to the German style, but with little slavish imitation. The distinctness of English typography is maintained, while the beautiful German combination borders, produced with such profusion of late, are judiciously utilized, often in conjunction with American type. In the arrangement of colors English printers prefer the quiet harmonious tints of the Germans to the bold striking contrasts of the Americans.

Improvements in newspaper printing;

In type founding.

Printers' Specimen Exchange.

Artistic printing.

The vast extent of the operations of the printing fraternity at the present day is in remarkable contrast to those of the 15th century, when the making of books was an art like the sculpture of statues or the designing of buildings. Now, printing is a manufacture in which large capital and the greatest division of labor are essential. The old printers were almost entirely independent of other craftsmen. From the casting of the type to the mixing of the ink they did nearly everything for themselves. Gradually the different departments of the art were constituted separate and recognized trades. The type-founder was probably the first to secede from the concern; then printers delegated to others the making of presses; afterwards the ink and the rollers found separate and distinct manufacturers; and there arose a class of persons who, though belonging to other trades, made printing appliances a specialty, such as printers' smiths, printers' joiners, and printers' engineers. Subdivision again has taken place in regard to the operations which chiefly appertain to printing. The same man was formerly able to set up and print off the types, to fold the sheets perhaps, and even to make them up into books. The operative printer has now become either a pressman or a compositor. If he is of the first denomination, he may be classed according as he works at press or machine. If he is a machinist, he may superintend or be a "minder," or he may be a layer-on or a taker-off of the sheets. If he is a minder, he may understand only book machines or only news machines; he may know all about platens and little about cylinders; or of cylinders he may know only one kind. Entirely novel machines create a new class of artisans. There are men perfectly competent to manage a Walter press who are ignorant how to work two-color or fine book-work machines. In the compositor's department division of labor is carried out to a still minuter degree. An old-fashioned printer would set up indifferently a placard, a title-page, or a book. At the present day we have jobbing hands, book hands, and news hands, the word "hand" suggesting the factory-like nature of the business. There are jobbing hands who confine themselves to posters, and know little about general work even in this department. Book hands comprise those who set up the titles and those who set up the body of the work. Of these latter again, while one man composes, another, the "maker-up," arranges the pages. Even the art of fitting up the furniture or "dressing the chase" is given to the "quoin-drawer overseer." News hands include advertisement hands and general hands. Some men work by day, others altogether by night; some do general book-work composition; others set up head-lines; others make up the the galleys; others "prove" them.

Division of labor.

Old Style Printing.

Within the last few years there has been an interesting revival of the old style of book printing. It owes its origin to Mr. Whittingham of the Chiswick Press, who in 1843 was desirous of printing in appropriate type a work of fiction the diction of which was supposed to be that of the reign of Charles II. As the original "old face" matrices of the first Caslon had been preserved, a font was cast from them, and on getting a proof with good ink, on good paper, from a modern press the impression was found to be far superior to specimens printed from the original font. Since then the demand for old-faced characters has steadily increased, and all founders now supply imitations of the old types. Comparing the old face and the modern characters, the latter are more regular in size, lining, setting, and color,—using these words in the technical sense of the founder; they have finer strokes and serifs, and produce in the page a more regular and sparkling general effect. At the same time it may be conceded that legibility has been to a certain extent sacrificed to beauty and general effect. About 1882 an eminent French printer made a number of experiments to ascertain what it is that constitutes legibility in type, and found that people read with less fatigue according as the letters—(*a*) are more round, (*b*) are more equal in thickness, (*c*) have shorter upstrokes, (*d*) are dissimilar to each other, and (*e*) are well proportioned to their own body. Drawings of letters from old books were visible and legible at a distance at which modern letters could not be distinguished. The revival has also

Old style printing.

brought about the re-introduction of antique head-pieces and tail-pieces, vignettes, and initial letters, which have been reproduced from old books by photography and typo-etching. For this kind of printing white paper has given place to toned, of a straw tint, which is often more agreeable to the eyes than the excessively bleached paper which was hitherto the fashion. Also hand-made instead of machine-made paper has to a large extent come into vogue. Its characteristic is the "deckle edge," which distinguishes it from the clean-cut edge of machine papers, and is highly prized by some bibliophiles. When extreme verisimilitude is required, this kind of printing is done on the blank leaves of real old books, some of which have been ruthlessly destroyed for this modern craze. On the whole, however, the revival of old style printing has been beneficial: it has encouraged printers to study the more artistic attributes of the productions of the great printers of the past, and has educated the public taste by presenting them with examples of the best kind of book-making.

Printing Establishment.

Departments of a printing establishment.

A large book-printing establishment contains many distinct departments, some of which have not been previously referred to and may here be summarily mentioned. The reading department, sometimes called the *closet*, consists of a number of small apartments, each furnished with a desk, a couple of stools, and a shelf for books of reference, and having for its occupants the reader and his reading-boy. There is also the warehouse, where all the printed and unprinted sheets (or "white paper" as it is called, whatever its color) are stored. Adjacent to this are folding, cutting, hot and cold pressing, drying, and other branches, each employing separate classes of artisans. Another department is the machine room, where, arranged in long rows with an avenue between, are the various printing machines. The men in this part of the establishment wear cotton vestments, covering all their other apparel, and caps, invariably made of paper, something like clerical birettas. The machine overseer has his box and keeps an account of the produce of each machine. Under him are the persons whose business it is to cut out overlays for the cut or illustrated forms. These men are in their way artists, for to them is attributable much of the beauty and perfection of working of each block that goes through their hands. They have by them three or four prints or "pulls" of the block, and their tools consist of scissors, paste, a sharp knife or two, and perhaps a razor-like blade set in a wooden handle. Their work is to deepen the shadows, raise the lights, lower the edges, and perform a hundred other offices for a block. Standing sentry over each machine is the machine minder; under him are the takers-off and layers-on. The engine-room and boiler-house are close by, and higher up may be the hand-press-room,—provided these appliances are used. Here are the pressmen and their apprentices. There is the storekeeper's department, fitted up with shelves, racks, and draws, for the orderly storage of type and materials. The plate-safe or plate-room is the repository of the stereo and electro plates, each plate being kept wrapped up in paper, with a distinctive index number marked thereon. There are also rooms for casting rollers, stereotyping rooms, drying rooms for paper, hydraulic pressing rooms, sinks for washing forms, and lifts for conveying them from one department to another. There will possibly be several composing-rooms, such as the *'stab*, where all the men are paid on established weekly wages, the piece room, where they are paid by results, and the apprentice's room. There may be rooms where particular jobs are done, especially if weekly periodicals are turned out, and the names of these designate the rooms.

Compositors' partnerships.

At the end of each room is the overseer. It is also a common practice for a number of men to form themselves into a kind of business partnership called a *companionship* or *'ship*. All the transactions of the compositor may be with his own *clicker*,—the workman who is selected to keep the accounts of the partnership. From him the compositor receives his portion of copy and the necessary directions, and to him he gives the matter when it is composed. At the end of the week he "writes his bill," delivers it to the clicker, and from the latter receives at pay time the wages he has earned. The clicker gets the matter proved or "pulled" by the proof-puller, who usually does nothing else but pull proofs. He will then send the proof with the copy to the overseer, and the overseer sends it to the reading department to be corrected. The proof, when corrected, is returned through the overseer (who retains the copy) to the clicker, and he gives it to the compositor who set it up. When the type is corrected a revise is pulled, which goes through the same hands to the overseer again; and then it is despatched to the author, editor, or publisher. In a well-ordered composing-room strict silence is enjoined upon the workmen. Among the industrial pursuits there is none more monotonous and more exacting, none demanding more patience, sustained industry, and power of endurance than the compositor's art. In a large newspaper office the quantity of types picked up in a few hours is marvellous. No better illustration of this could be given than the fact that several recent issues of the *Times* have consisted of three sheets or twenty-four pages, each page comprising six columns. In one of these issues 84⅔ of the 144 columns were filled with advertisements, 2559 in number, set in extremely small type; the remaining 59⅓ columns contained articles, reviews, letters, reports, and paragraphs. The total length of the column aggregate was 264 feet (62 more than the height of the London Monument). If the matter comprised in the paper, instead of being broken up into columns, had been set in one continuous line it would have reached one mile 950 yards. The number of separate types used in printing this issue was calculated at over two millions, and the quantity of printed matter was reckoned to be equivalent to that contained in two octavo volumes of 480 pages each. The literary and mechanical staff of a first-rate London daily newspaper, excluding casual reporters and unattached writers on various subjects, aggregates about 300 persons.

Bibliography.—On the practice of the art and its auxiliary processes, see Southward, *Dictionary of Typography* (3d ed., London, 1875, 8vo; with the *Literary Almanack* by William Blades), and *Practical Printing: a Handbook of the Art of Typography* (3d ed., London, 1887, 2 vols., 8vo). This last is the fullest work on the subject in the English language, embracing composition, press work, stereotyping, and electrotyping, and the warehouse department of a printing office. Gould's *Letterpress Printer* (2d ed., Middlesborough, 1880, 12mo) has a short introduction by Southward, giving a sketch of the origin and progress of the different typographical processes and appliances from the beginning. See also F. J. F. Wilson. *Typographic Printing Machines and Machine Printing* (3d ed., London, 1883, 8vo); *List of Technical Terms relating to Printing Machinery* (London, 1882, 8vo); Noble. *Machine Printing* (London, 1883, 8vo) and *Principles and Practice of Color Printing* (London, 1881, 8vo); and Wilson, *Stereotyping and Electrotyping* (London, 1880, 8vo). This last contains a history of stereotyping and electrotyping by Southward. The best works in French are —Lefèvre, *Guide Pratique du Compositeur et de l'Imprimeur* (Paris, 1855–72, 8vo, two parts; includes machine work, stereotyping, and electrotyping); Claye, *Manuel de l'Apprenti Compositeur* (3d ed., 12mo, Paris, 1883); and Monet, *Les Machines et Appareils Typographiques, suivi des Procédés d'Impression* (Paris, 1879, 8vo). The best German work, and one which from its completeness supersedes all others, is Waldow's *Illustrierte Encyklopädie der graphischen Künste* (Leipsic, 1884, lar. 8vo), containing 2798 articles and 581 illustrations, with a list of German books on typography, etc. [America, the standard manual is MacKellar's *American Printer*. —Am. Ed.]

Periodicals.—No trade or interest in the world has, perhaps, so many representatives in the press as printing. The journals which record its progress and describe its products are unrivalled in their excellent mechanical attributes, some equalling the highest class of book-work printing and using paper of the most luxurious description. Their literary character is usually worthy of their mechanical excellence, and they comprise an immense collection of facts and speculations on the subjects involved. They also attract a class of writers who in time become specialists and do the most valuable work in historical investigation. The *Printers' Register* (monthly), begun in 1863, the oldest of the English printing trade journals, contains several valuable contributions by Mr. William Blades, the biographer of Caxton, such as "Numismata Typographica," "Bibliotheca Typographica," "Books and their Enemies" "The Inventor of the Steam Printing Press," and "Early Type Specimen Books." The *Paper and Printing Trades Journal* (quarterly), begun in 1872, is printed in old style fashion, and reproduces in tone as well as in manner some of the best examples of the French and Italian schools in head and tail pieces, vignettes, and ornamental initials. In France appear *L'Imprimerie* (semi-monthly) and the *Bulletin de l'Imprimerie;* in Germany, *Archiv für Buchdruckerkunst* (monthly) and *Journal für Buchdruckerkunst;* in Italy *L'Arte della Stampa*. The United States has the *Inland Printer* (Chicago) and the *American Bookmaker* (New York). The fullest list of such journals, past and present, is Louis Mohr's *Die periodische Fachpresse der Typographie* (Strasburg, 1879). There is also an extended list, with historical annotations, in Bigmore and Wyman's *Bibliography of Printing*. (J. SO.)

TYR. See Æsir, vol. i. p. 190.

TYRE, the ancient צר, Greek Τύρος, the most famous of Phœnician cities, is now represented by the petty town of Ṣûr, with about 5000 inhabitants, built round the harbor at the north end of a peninsula, which till the time of Alexander's siege was an island.

The mole which he constructed to reach the island city has been widened by deposits of sand, so that the ancient island is now connected with the mainland by a tongue of land a quarter of a mile broad. The greatest length of the former island, from north to south, is about $\frac{5}{8}$ of a mile and its area about 142 acres, a small surface for so important a town. The researches of Renan seem to have completely refuted the once popular idea that a great part of the original island has disappeared by natural convulsions, though he believes that the remains of a line of submerged wall at the south end indicate that about 15 acres more were once reclaimed from the sea and have been again lost. Confined to this narrow site—on which, moreover, place was found for the great temple of Melkarth with its courts and for all the necessities of a vast trade, for docks and warehouses, and for the great purple factories which in the Roman time were the chief source of wealth and made the town an unpleasant place of residence (Strabo, xvi. 2, 23; Pliny, v. 76)—Tyre was very closely built; Strabo tells us that the many-storied houses were loftier than those of Rome. In the Roman period the population overflowed its bounds and occupied a strip of the opposite mainland, including the ancient Palætyrus. Pliny gives to the whole city, continental and insular, a compass of 19 Roman miles; but this account must be received with caution. In Strabo's time the island was still the city, and Palætyrus on the mainland was 30 stadia off, while modern research indicates an extensive line of suburbs rather than one mainland city that can be definitely identified with Palætyrus. The ancient history of Tyre has been dealt with in the article PHŒNICIA; the topography is still obscure owing to the paucity of Phœnician remains. The present harbor is certainly the Sidonian port, though it is not so large as it once was; the other ancient harbor (the Egyptian port) has disappeared, and is supposed by Renan to have lain on the other side of the island, and to be now absorbed in the isthmus. The most important ruins are those of the cathedral, with its magnificent monolith columns of rose-colored granite, now prostrate. The present building is assigned by De Vogué to the second half of the 12th century, but the columns must be older and may have belonged to the 4th-century church of Paulinus (Euseb., *H. E.*, x. 4). The water supply of ancient Tyre came from the powerful springs of Rás al-'Ain on the mainland, one hour south of the city, where there are still remarkable reservoirs, in connection with which curious revivals of Adonis worship have been observed by Volney and other travellers. Tyre was still an important city and almost impregnable fortress under the Arab empire. From 1124 to 1291, it was a stronghold of the crusaders, and Saladin himself besieged it in vain. After the fall of Acre the Christians deserted the place, which was then destroyed by the Moslems. The present town has arisen since the Metâwila occupied the district in 1766.

TYROL, a province of Austria, with the title of "county," lies between 10° 10′ and 13° E. long. and 45° 40′ and 47° 45′ N. lat., and is conterminous on the northwest with the Austrian province of Vorarlberg, on the north with Bavaria, on the east with Salzburg and Carinthia, on the southeast and southwest with Italy, and on the west with Switzerland. The last-named country forms in the lower Engadine an angle penetrating deeply into Tyrol. The country is entirely mountainous, being traversed by the main chain of the Alps. It may be roughly divided into the valley systems of the Lech and the Inn to the north of the chain and of the Etsch or Adige (Vintschgau) and the upper Drave (Puster valley) to the south (see ALPS). Its area is 10,316 square miles; its population in 1880 was 805,176, inclusive of military, showing an increase of nearly 4 per cent. since 1869. Of these 432,062 spoke German, 360,975 Italian or some Romance dialect, and the remainder some form of Slavonic; 565,468 persons were able to read and write, 56,728 to read only, leaving about 22⅔ per cent. of the total population, including children, wholly illiterate. Education is strictly compulsory; but the schools are for the most part closed during the summer months, when all available hands are required in the fields and on the mountain pastures. Agriculture and forestry occupy about two-thirds of the entire population. Every householder owns a piece of cultivable land in the valley, while his goats, sheep, or cattle are driven with those of his neighbors to the mountain pastures (*Alpen*, *Almen*) which belong to the commune. Each commune has a president chosen by an elected committee of householders. The man selected cannot decline, but is bound to serve his term of office. The tenure of property is for the most part of the nature of absolute ownership. In 1880, 100,393 persons of both sexes were returned as proprietors, 10,283 as tenants. The chief products are milk, butter, and cheese. Of grain crops maize, which is largely grown in the Inn valley and Vintschgau, holds the first place. Wheat is grown in the lower valleys, barley and rye in the higher, the latter in favorable spots at a height of over 5000 feet. Potatoes are found above 6000 feet. In the Etsch valley, or district about Meran and Botzen, red and white wine of excellent quality is produced (in 1884 about 6,500,000 gallons). Of late years the cultivation of fruit has much developed, especially in south Tyrol. Silk is also produced (in 1885, 1268 tons of cocoons). Game is still plentiful in the remoter valleys. In every district there are a certain number of licensed hunters, the principal game being red deer, chamois, hares, blackcock, ptarmigan, etc. Mining occupies about one-fifth of the population. At Hall near Innsbruck are important salt works, and at Brixlegg in the same valley copper and lead are smelted. Iron is worked at Fulpmes in the Stubai valley and at Prad in the Vintschgau. Zinc is found at the head of the Passeir valley. In the Middle Ages gold and silver were found in sufficient quantities to make it worth while to extract them. About 4340 square miles of the country are covered with forest, chiefly pine, fir, and larch, which, however, is felled in a recklessly wasteful way. The capital of the county is INNSBRUCK (*q.v.*).

The general average of comfort in Tyrol is high, and the cost of living is very moderate. The peasant and his family are clothed in stuffs spun and woven at home, from the wool and flax produced in their own neighborhood. The people are for the most part somewhat reserved in manner, but courteous and hospitable. The savage fights which used to be a favorite pastime among the younger men are now almost, or quite, a thing of the past. In some valleys there is a good deal of musical talent; and companies of Tyrolese singers, particularly from the Ziller valley, travel about all over Germany. The zither is a favorite instrument, especially in the southern valleys; in the northern the guitar is more frequent. The religion is almost exclusively Roman Catholic; but in Innsbruck there are some hundreds of Protestants. The priests belong chiefly to the peasant class, and receive their education at Brixen and the university of Innsbruck. This contains about 600 students in the various faculties and possesses a library of some 60,000 volumes. There is a diet, or landtag, with its seat at Innsbruck, consisting of thirty-four representatives of the peasants, thirteen of the citizens, four of the prelates, ten of the nobles, three of the chambers of commerce at Innsbruck, Botzen, and Roveredo, and one of the university of Innsbruck. To the imperial reichsrath Tyrol sends eighteen members. Tyrol is garrisoned by troops recruited exclusively in Tyrol and Vorarlberg, and never, except in time of war, employed outside these provinces. Besides this there are the landwehr and the landsturm or militia.

History.—The country corresponding to modern Tyrol first appears in history when the Rhætians were subdued by Drusus and Tiberius. This nation, by some held to have been cognate with the Etruscans, occupied the valleys from the source of the Rhine to that of the Drave. To the north of them were the Vindelici, and to the east the Norici; the

former were apparently separated from them by the ridges north of the Inn, the latter by the water-shed between the Etsch and the Drave. Pliny (*N. H.*, iii. 24), gives the names of all the tribes. After their subjection by Rome these races became Romanized and shared the fortunes of the empire. Their position on and about the roads by which the central Alps are most easily crossed laid them especially open to inroads, and before the end of the 3d century the Alemanni had traversed the country. In the course of the next three centuries this people settled in the northwestern valleys. But the peopling of the greater part of the province by Teutons was effected by the Baiuvarii, who were by the year 600 established throughout nearly the entire remainder of German Tyrol, some of the Romanized Rhætians probably being left, mixed with a few Alemannic stragglers, in the upper Vintschgau, while the Lombards pressed up from the southward and took possession of the district around Trent. The Alemanni and Baiuvarii, governed immediately by their own dukes, owned a kind of allegiance to the kings of the Franks, and ultimately became in the time of Pippin and Charles incorporated in the Frankish monarchy. The country was then divided for administrative purposes into counties (*comitatus Grafschaften*), under counts, whose rank, at first merely official, in course of time became, with their office, hereditary. The most powerful among them appear to have been those of the Vintschgau, where a fertile soil and a climate less rigorous than that of the northern valleys allowed more development of wealth. In the 12th century the counts of Tirol begin to be conspicuous. This was a small district near Meran, taking its name from the ancient castle of Tirol, known in the later Roman time as Teriolis. These, in the course of the next century, acquired the lordship over nearly all the territory now contained in the province of Tyrol south of the main chain of the Alps, besides the advocacy (*Schirmvogtei*) of the wealthy sees of Brixen and Trent. Meantime the valley of the Inn and those adjoining it had come under the dominion of the counts of Andechs, a Bavarian family, who were also titular counts of Meran. The last of these died without issue in 1248. His wife's sister, Adelaide, married to Meinhard, count of Görz, was left in sole possession of nearly the whole of the province. Their son Meinhard II. (1257–1295) was connected with some of the most powerful houses in Germany; and, being a man of great ability and equal unscrupulousness, he succeeded in acquiring the few outlying portions of territory and castles still belonging to the smaller nobles, and thus consolidated Tyrol within the limits by which it has ever since been bounded. Carinthia and Styria also formed part of his domains; but their connection with Tyrol has never been other than a personal one. Meinhard II. was succeeded in turn by his sons Otho and Henry. The latter (1310–1335), a weak and extravagant prince, seems to have done much towards organizing the government of the country. His elder daughter, Margaret, known in Tyrolese history and legend as *Die Maultasche*, "the Pocket-mouth," the heiress of his territories, took as her second husband (in 1342) Louis of Brandenburg. Their son, Meinhard III., who succeeded to the county on his father's death in 1361, died in 1363. Margaret thereupon made over all her possessions to the house of Hapsburg, and since that time Tyrol has formed part of the hereditary dominions of the archdukes of Austria (see AUSTRIA). The fidelity of the Tyrolese to their counts has for many centuries been proverbial. The Brenner has more than once offered them a secure line of retreat and the mountains a rampart of defence. Maximilian I. (1493–1519) had an especial affection for Tyrol. He conferred on the province its present title of *Die gefürstete Grafschaft;* he profited on more than one occasion by the refuge it afforded; he spent much of his time within it; and at his death he directed that a sumptuous monument to himself should be erected in the Franciscans' church at Innsbruck. Tyrol has more than once been the scene of sharp fighting. In 1499 the men of Graubünden or the Grisons (see SWITZERLAND) invaded the country and defeated the Tyrolese in the neighborhood of Mals. In 1703 Max Emmanuel, elector of Bavaria, penetrated the upper Inn valley, but was driven back. During the wars of the French Revolution French and Austrian armies met more than once within the limits of the province. By the treaty of Pressburg, 1805, the province was transferred to Bavaria. On the renewal of war between Bonaparte and Austria in 1809 the people rose and expelled the Bavarians, and afterwards, under the leadership of Andreas Hofer, an innkeeper of the Passeir valley, repeatedly defeated the French, Bavarian, and Saxon forces. Innsbruck was more than once taken and retaken; and on 12th August Hofer, after defeating Marshal Lefebvre, was installed in the capital as commandant. But the ill-success of the Austrian arms elsewhere prevented any support from being sent, and by the treaty of Schönbrunn in October the Tyrolese were again given up to their new rulers. Hofer, being captured through treachery, was shot at Mantua, 20th February, 1810. On the fall of Bonaparte, Tyrol reverted to the house of Hapsburg.

See A. Jäger, *Die Verfassung Tirols*, Innsbruck, 1881–85; Egger, *Die Tiroler und Vorarlberger*, Innsbruck, 1872–79; Stenb, *Drei Sommer in Tirol*, Stuttgart, 1871 (2d ed.). (A. J. B.)

TYRONE, an inland county of Ireland, in the province of Ulster, is bounded N. and W. by Donegal, N.E. by Londonderry, E. by Lough Neagh and Armagh, and S. by Monaghan and Fermanagh. Its greatest length from north to south is 46 miles and from east to west 60. The total area in 1881 was 806,658 acres or about 1260 square miles. The surface is for the most part hilly, rising into mountains towards the north and south, but eastwards towards Lough Neagh it declines into a level plain. Running along the northeastern boundary with Londonderry are the ridges of the Sperrin Mountains (Sawell 2236 feet and Mecnard 2064 feet). Farther south there are a range of lower hills and Mullaghearn, to the north of Omagh (1890 feet). South of Clogher a range of hills (1265 feet) forms the boundary between Tyrone and Monaghan. On each side of the Mourne river near Omagh rise the two picturesque hills Bessy Bell and Mary Gray. The Foyle forms a small portion of the western boundary of the county, and receives the Mourne, which flows northward by Omagh and Newtown Stewart. The principal tributaries of the Mourne are the Derg, from Lough Derg, and the Owenkillew, flowing westward from Fir Mountain. The Blackwater, which is navigable by boats to Moy, rises near Five-Mile Town, and forms part of the southeastern boundary of the county with Monaghan and Armagh. With the exception of Lough Neagh, bounding the county on the east, the lakes are small, also few in number. Lough Fea is picturesquely situated in the northwest, and there are several small lakes near Newtown Stewart. The Ulster Canal runs along the southern boundary of the county from Lough Neagh to Caledon. The substratum of the northern mountains is mica slate interspersed with primary limestone. Yellow sandstone appears in the northwest, in the centre towards Omagh, and in the southwest, where it plunges into Fermanagh. The greater portion of the central area of the county is occupied by Old Red Sandstone. The Tyrone coal-field (6 miles long by 1 to 2 broad) extends between Lough Neagh and Dungannon, all the measures being represented. The coal-field is much broken by faults and has been worked chiefly near the surface, and generally in an unskilful manner; the principal pits are near Dungannon and at Coal Island. The coal is bituminous. There are also indications of copper, iron, and lead.

Agriculture.—The hilly portions of the county are unsuitable for tillage; but in the lower districts the soil is remarkably fertile, and agriculture is generally practiced after improved methods, the county in this respect being in advance of most parts of Ireland. The excellent pasturage of the hilly districts affords sustenance to a large number of young cattle. The total number of holdings in 1885 was 27,958, of which 16,469 or nearly two-thirds were each between 5 and 30 acres in extent (8365 between 5 and 15 and 8104 between 15 and 30). Only 43 were above 500 acres; 642 were between 100 and 500 acres, 2373 between 50 and 100, 3937 between 30 and 50, 2573 between 1 and 5, and 1921 did not exceed 1 acre. There were 237,528 acres under crops, including meadow and clover (255,281 acres in 1876), 318,550 acres under grass, 1765 fallow, 9378 woods, 72,071 bog and marsh, 109,539 barren mountain land, and 36,112 water, roads, fences, etc. The area under corn crops decreased between 1876 and 1885 from 115,738 acres to 105,343,—oats from 114,223 acres to 104,040, and wheat from 1166 to 1013. The areas under the other corn crops are very small and fluctuate considerably. The area under green crops between 1876 and 1885 decreased from 64,971 to 59,387 acres,—potatoes from 44,001 to 40,649, turnips from 17,157 to 15,581, mangel wurzel from 750 to 487, and other green crops from 3063 to 2670. Flax (23,901 acres in 1876) covered 16,364 acres in 1885. The area under meadow and

clover in 1876 was 50,671, and in 1885 56,434, but there has been no increase since 1878. The number of horses decreased between 1876 and 1885 from 25,038 to 23,185, of mules from 71 to 49, of asses from 1124 to 921, of cattle from 176,841 to 168,072, of sheep from 45,274 to 44,434, and of pigs from 49,012 to 39,530. On the other hand, the number of goats increased from 7950 to 8984, and of poultry from 674,826 to 737,859.

According to the latest landowner's *Return* (1876), the county was divided among 2787 proprietors owning 775,285 acres at a total annual value of £426,224 [$2,071,448.64], the average value per acre being nearly 11s. [$2.67]. Of the proprietors 1070 owned less than 1 acre each, the total distributed amongst them being 272 acres. The estimated extent of waste land was 4000 acres. The following possessed over 10,000 acres each—duke of Abercorn 47,615 acres, earl of Castlestuart 32,615, earl of Caledon 29,236, commissioners of church temporalities 28,002, Sir John M. Stewart 27,906, Arthur W. Cole Hamilton 16,683, representatives of Sir William M'Mahon 16,326, Sir William Verner 16,043, earl of Belmore 14,359, Thomas Arthur Hope 13,996, Lord Dorchester 12,608, Michael Smith 10,968, Louisa Elizabeth De Bille 10,455, and Thomas R. Browne 10,125.

Communication.—Besides Lough Neagh and the Ulster Canal, Tyrone has the river Foyle, which is navigable for small craft to a point opposite St. Johnstone, and thence by artificial cutting to Strabane, and the Blackwater, which is navigable for boats to Moy. The Great Northern Railway intersects the county by Dungannon, Pomeroy, Omagh, Newtown Stewart, and Strabane.

Manufactures.—The manufacture of linens and coarse woollens (including blankets) is carried on. Brown earthenware, chemicals, whisky, soap, and candles are also made. There are a few breweries and distilleries, and several flour and meal mills. But for the lack of enterprise the coal and iron might aid in the development of a considerable manufacturing industry.

Administration and Population.—The county comprises 8 baronies, 46 parishes, and 2164 townlands. Formerly it returned two members to parliament, the borough of Dungannon also returning one; but in 1885 Dungannon was disfranchised and the county arranged in four divisions—east, mid, north, and south—each returning one member. It is in the northwestern circuit, and assizes are held at Omagh and quarter-sessions at Clogher, Dungannon, Omagh, and Strabane. There are fourteen petty sessions districts within the county and portions of four others. The county is in the Belfast military district.

From 312,956 in 1841 the population had decreased by 1861 to 238,500, by 1871 to 215,766, and by 1881 to 197,719 (96,466 males and 101,253 females). In 1881 there were 109,793 Roman Catholics (119,937 in 1871), 44,256 Protestant Episcopalians (49,201 in 1871), 38,564 Presbyterians (42,156 in 1871), 3597 Methodists (3115 in 1871), and 1509 of other denominations (1357 in 1871). The number of persons in the county who could read and write in 1881 was 98,764, who could read only 38,783, the remainder (60,172) being wholly illiterate. Twenty-two persons could speak Irish only and 9796 Irish and English. For the seven years ending 1885 the average number of emigrants annually was 3085. The population of the principal towns in 1881 was—Strabane 4196, Omagh (the county town) 4138, Dungannon 4084, and Cookstown 3870.

History and Antiquities.—Anciently Tyrone was included in the portion of Ulster made "sword-land" by the Scots. It became a principality of one of the sons of Niall of the Nine Hostages, and from his name—Eogain—was called Tir Eogain, gradually altered to Tyrone. From Eogain were descended the O'Neals or O'Neills and their numerous septs. The family had their chief seat at Dungannon until the reign of Elizabeth, when it was burned by Hugh O'Neill to prevent it falling into the hands of Lord Mountjoy. The earldom of Tyrone had been conferred on Con Bacagh O'Neill by Henry VIII., but he was driven into the Pale by one of his sons Shan, who with the general consent of the people was then proclaimed chief. From this time he maintained a contest with English authority, but his last remaining forces were completely defeated near the river Foyle in May, 1567. During the insurrection of 1641 Charlemont Fort and Dungannon were captured by Sir Phelim O'Neill, and in 1645 the Parliamentary forces under General Munro were signally defeated by Owen Roe O'Neill at Benburb. At the Revolution the county was for a long time in the possession of the forces of James II. Dungannon was the scene of the famous volunteer convention in 1782. Raths are scattered over every district of the county. There is a large cromlech near Newtown Stewart, another at Tarnlaght near Coagh, and another a mile above Castlederg. At Kilmeillie near Dungannon are two circles of stones. The monastic remains are of comparatively little interest. There are still some ruins of the ancient castle of the O'Neills, near Benburb, and among other ruined old castles mention may be made of those of Newtown Stewart, Dungannon, Strabane, and Ballygawley.

TYRTÆUS, Greek elegiac poet, lived at Sparta about the middle of the 7th century B.C. According to the legend current in later times, he was a native of the Attic deme of Aphidnæ, and was invited to Sparta, on the suggestion of the Delphic oracle, to assist the Spartans in the Second Messenian War. It is difficult, if not impossible, to determine the element of truth in this story. Herodotus at least either did not know, or disbelieved, the tradition, which meets us first in Plato (*Laws*, i. 629A), to the effect that, although Tyrtæus was by birth an Athenian, he had the Spartan citizenship conferred upon him (see Herod., ix. 35). From Plato down to Pausanias we can trace the gradual growth and expansion of the legend. Ephorus is the first to call Tyrtæus a lame poet; by later generations he is represented as a lame school-master. Basing his inference on the ground that Tyrtæus speaks of himself as a citizen of Sparta (*Fr.* 2 v. 3), Strabo (viii. 4, 10) was inclined to reject the story of his Athenian origin, regarding the elegies in question as spurious. On the whole, perhaps, the conjecture of Busolt (*Gr. Gesch.*, p. 166) comes nearest to the truth: the entire legend may well have been concocted during the 5th century in connection with the expedition sent to the assistance of Sparta in her struggle with the revolted Helots at Ithome: It is possible, as Busolt suggests, that Tyrtæus was in reality a native of Aphidna in Laconia. However this may be, it is certain from the fragments of his poems that he flourished during the Second Messenian War (*circ.* 650 B.C.)—a period of remarkable musical and poetical activity at Sparta (see TERPANDER)—that he not only wrote poetry but took part in the actual service of the field, and that he endeavored to compose the internal dissensions of Sparta by inspiring the citizens with a patriotic love for their fatherland and its institutions.

We possess in all about twelve fragments of Tyrtæus's poetry, varying in length from one to forty-four lines. They are preserved by Strabo, Lycurgus, Stobæus, and others. We may divide them into two varieties, according to the metre and dialect in which they are composed. The first class consists of elegies in the Ionic dialect, written partly in praise of the Spartan constitution and King Theopompus (Εὐνομία), partly to stimulate the Spartan soldiers to deeds of heroism in the field ('Υποθῆκαι—the title is, however, later than Tyrtæus). The interest of the fragments preserved from the Εὐνομία is mainly historical: they form our only trustworthy authority for the events of the First Messenian War (*Fr.* 5, 6, 7). The 'Υποθῆκαι possess considerable poetic merit, in spite of the occasional monotony of their versification. Addressed to a nation of warriors, they paint in vivid colors the beauty of bravery and the shame of cowardice; there are also lines in them which reveal the soldier as well as the poet, *e.g.*, *Fr.* 10, 31–32. One striking feature is the genuinely Greek feeling for plastic beauty, showing itself in the beautiful picture of the youthful form lying dead upon the battlefield (*Fr.* 10, 27–30, and 12, 23–34; see also Symonds's *Greek Poets*, i. p. 74). The popularity of these elegies in the Spartan army was such that, according to Athenæus (xiv. 630 F), it became the custom for the soldiers to sing them round the camp fires at night, the polemarch rewarding the best singer with a piece of flesh. Of the second class of Tyrtæus's poems, marching songs, written in the anapæstic measure and the Dorian dialect, the remains are too scanty to allow of our pronouncing a judgment on their poetic merit.

See Bergk, *Poetæ Lyrici Græci*, vol. ii. pp. 8–22, Leipsic, 1882. Fragment 10 (τεθνάμεναι γὰρ καλόν, etc.) has been translated into English verse by Campbell.

TYTLER. The surname of three Scottish writers, principally on historical subjects.

1. Alexander Fraser Tytler (1747–1813), Lord Woodhouselee, Scottish judge, was the eldest son of William Tytler (see below), and was born at Edinburgh on 15th October, 1747. After passing through the High School, he was sent in 1763 to a school at Kensington taught by Dr. Elphinston, the translator of Martial's *Epigrams*. He returned to Edinburgh in 1765, skilled in Latin versification, and with a competent knowledge of Italian, and a taste for drawing and natural history. He was called to the bar in 1770. His first work, a supplement to the *Dictionary of Decisions*, undertaken on the suggestion of Lord Kames, was published in 1778, and a continuation appeared in 1796. In 1780 Tytler was appointed conjoint professor of universal history in the university of Edinburgh, becoming sole professor in 1786. In 1782 he published *Outlines* of his course of lectures, afterwards extended and republished under the title of *Elements of General History*. The *Elements* has passed through many editions, and has been translated into several European languages as well as into Hindustani. The lectures themselves were published in 1834 in Murray's *Family Library*. In 1790 Tytler was appointed judge-advocate of Scotland, and while holding this office he wrote a *Treatise on the Law of Courts-Martial*. In 1801 he was raised to the bench, taking his seat (1802) in the court of sessions as Lord Woodhouselee. He died at Edinburgh on 5th January, 1813.

Besides the works already mentioned, he was the author of several papers in the *Mirror*, the *Lounger*, and the *Transactions of the Royal Society of Edinburgh*; he also wrote *Life and Writings of Dr. John Gregory*; *Essay on the Principles of Translation*, 1790; a dissertation on *Final Causes*, prefixed to his edition of Derham's *Physico-Theology*, 1799; a political pamphlet entitled *Ireland Profiting by Example*, 1799; an *Essay* on Laura and Petrarch; and *The Life and Writings of Henry Home, Lord Kames*, 1807.

2. Patrick Fraser Tytler (1791–1849), as the son of Lord Woodhouselee and grandson of William Tytler, may be said to have inherited a taste for literary and historical pursuits. He was born at Edinburgh on 30th August, 1791, and was educated chiefly at the High School and university, being called to the bar in 1813. His earliest literary effort appears to have been a chapter or two contributed to Alison's *Travels in France* (1815); and his first independent essays were papers in *Blackwood's Magazine*. Inheriting the family talent for music, and with a facility in throwing off humorous little poems and songs, he made several contributions to Thomson's *Select Melodies of Scotland*, 1824. In 1819 he published the *Life of James Crichton of Cluny, commonly called the Admirable Crichton*, a second edition appearing in 1823. This was followed by a *Memoir of Sir Thomas Craig of Riccarton*, 1823; an *Essay on the Revival of Greek Literature in Italy*, and a *Life of John Wickliff*, published anonymously, in 1826. The *History of Scotland* was undertaken at the suggestion of Sir Walter Scott, and occupied Tytler for nearly twenty years, in the course of which he removed to London for convenience of research. The first volume appeared in 1828, and the ninth and last in 1843. The original investigations on which the work was founded gave it an authority which no previous history of Scotland possessed, and the clear and graphic style made it interesting and popular. The last few years of his life were spent in physical prostration and mental depression, and he died at Great Malvern on 24th December, 1849.

During the progress of his *History* a large amount of other work came from his pen, as the following list shows: *Lives of Scottish Worthies*, for Murray's *Family Library*, 3 vols., 1831–33; *Historical View of the Progress of Discovery in America*, 1832, and *Life of Sir Walter Raleigh*, 1833, for the *Edinburgh Cabinet Library*; *Life of Henry VIII.*, 1837; *England under the Reigns of Edward VI. and Mary*, from original letters, 2 vols., 1839; article "Scotland" in the seventh edition of the Encyclopædia Britannica, afterwards published separately as a school history); *Notes on The Darnley Jewel*, 1843; on the *Portraits of Mary Queen of Scots*, 1845 (privately printed); and *Memoirs of the War carried on in Scotland and Ireland, 1689–91, by General Mackay*, edited in conjunction with Hog and Urquhart, and presented to the Bannatyne and Maitland Clubs in 1833.

3. William Tytler (1711–1792), of Woodhouselee, writer on historical and antiquarian subjects, was the son of Alexander Tytler, writer in Edinburgh, and was born in that city on 12th October, 1711. He was educated at the High School and the university, and, having adopted his father's profession, was in 1744 admitted into the society of Writers to the Signet. While successfully practicing as a lawyer, he found time to devote attention to historical investigation. In 1759 he published an *Inquiry, Historical and Critical, into the Evidence against Mary Queen of Scots, and an Examination of the Histories of Dr. Robertson and Mr. Hume with respect to that Evidence*. This work, which warmly defended the character of the queen, met with great success. Four editions, the later ones considerably enlarged, were published in the author's lifetime; and it was translated into French. In 1783 he published the *Poetical Remains of James the First, King of Scotland*, to which he added a dissertation on the life and writings of the royal author. He wrote an essay on "Scottish Music," which was appended to Arnot's *History of Edinburgh*. His "Dissertation on the Marriage of Queen Mary to the Earl of Bothwell" and "Observations on the Vision, a Poem," appeared in the *Transactions of the Society of Antiquaries of Scotland* (1791–92). A paper in the *Lounger*, on "Defects of Modern Female Education," and an *Account of Fashionable Amusements in Edinburgh in the Seventeenth Century* complete the list of his works. He died at Edinburgh on 12th September, 1792.

TYUMEÑ, a district town of West Siberia, in the government of Tobolsk, is situated at a point where the chief highway from Russia across the Urals touches the first navigable river (the Tura) of Siberia. A railway passing through Ekaterinburg and the principal iron-works on the eastern slopes of the middle Urals connects Tyumeñ with Perm, the terminus of steamboat traffic on the Kama and Volga. The Tura being a tributary of the Tobol, which joins the Irtish, a tributary of the Ob, Tyumeñ has regular steam communication with Omsk and Semipalatinsk by the Irtish (steamers penetrating as far as Lake Zaisan in Dzungaria); with Tomsk, Barnaul, and Biysk, in the Altai, by the Ob and the Tom; with Irbit—the seat of the great Siberian fair—by the Tura and the Nitsa; and by the Tobol, the Irtish, and the Ob with the Arctic Ocean and the fisheries of the lower Ob. Tyumeñ stands also at the western extremity of the Siberian highway which goes *via* Omsk, Tomsk, and Krasnoyarsk to Irkutsk. In summer the Tura sometimes falls so low that steamers have to stop 90 miles off, passengers and goods being taken thence to Tyumeñ in lighter vessels. The town is well built, and stands on both banks of the Tura, which is here spanned by a bridge. The portion on the low left bank is inhabited by the poorest class and is often inundated; the best houses are on the high right bank. The streets are unpaved, but the houses (principally wooden) are for the most part inclosed by gardens. The people, who are famed throughout Siberia for their good looks, have always been renowned for their industrial skill. Woollen cloth, linen, belts, and especially boots and gloves, are manufactured to a large amount (70,000 pairs of boots and 300,000 pairs of gloves annually). Tyumeñ carpets, although made in the simplest way and with the plainest tools, have a wide renown in Russia and Siberia, and recently have appeared in the markets of western Europe as of Oriental origin. All kinds of metal wares are made in small workshops.

Sheepskins and various kinds of cloth are extensively manufactured, and the leather prepared at the tanneries (100 in number) is extensively sold all over Siberia, the Kirghiz steppe, and Bokhara. An establishment has recently been opened for the construction of barges, and a paper mill, the first in Siberia, was opened in 1886. The trade of Tyumeñ is exceeded only by that of Irkutsk and of Tomsk. In addition to its primary schools Tyumeñ has a "real" school. The population, which is of a fluctuating character in summer, is differently estimated at 13,000, 14,500, and 18,000.

TZETZES, JOANNES, a voluminous Byzantine writer of the 12th century. See GREECE, vol. xi. p. 130 *sq.*

U.

U holds the twenty-first place in our alphabet. The corresponding place in the Greek alphabets was occupied by Υ (with some slight variations of form). The form in the Italian alphabets was generally V. These three are only modifications of one original; but they are independent symbols with us, though Y does not represent any sound otherwise unrepresented. It will be most convenient to describe the three forms once for all.

With T we reach the end of the original Phœnician alphabet. The remaining symbols—no fewer than six with us, four in the completed Latin alphabet—are accretions, either modifications of old symbols for greater exactness or old symbols themselves which had fallen out of their proper place and were added again. The first new symbol was needed to represent the important vowel sound *u*. We have already seen that the Greeks employed the Phœnician symbols for the breaths which they did not want as symbols for the vowels which they did want. Thus we should have expected that the Phœnician vau would have been used for *u*. But vau was already employed for *w*, which was a living sound in early Greek; the form used was F (the so-called digamma), the origin of our F. What then was the origin of the symbol for *u*? In the earliest Greek we find the two forms Υ and V, *e.g.*, in inscriptions of Thera. Now the Moabite form of vau is Y, which resembles the Υ more than F. It is difficult to see why the presumably oldest Phœnician form should appear, not in the sixth place of the Greek alphabet, but at the end, where it must have been an arbitrary addition; and, although the Υ form could be derived from F (middle steps are found), it is not easy to get F from Y. We may suppose that the two symbols, F and Υ, were obtained by the Greeks from independent Phœnician alphabets, the first being kept by those Greeks who required a symbol for *w*, and did not at first need any special sign to distinguish *u* (which in the earliest Greek times known to us had the value of German *ü*) from *o*; while the others took the form Υ to express the modified *u*, and probably never really adopted the F, except as a numeral; it does not appear even in the very old Abu Simbel inscription written by the Ionian mercenaries of Psammitichus. It is noteworthy that in that inscription *both* the forms Υ and V appear, whereas in those of Thera and Melos we have sometimes the one sometimes the other, but not both in the same inscription, and a study of the writing leads to the conclusion that the Υ was felt to be the true (*i.e.*, the older) form, but that V was used more frequently for the sake of simplicity.

At Rome the single form V denoted both the vowel *u* and also the consonantal *w*. F retained its place as sixth in the alphabet, but with the value of *f*, which was unknown to the Greeks; a peculiar form, Ⅎ, in which the middle stroke has gone to the bottom, seems to have been affected by its neighbor E; this is found in Etruscan, Umbrian, and Samnite inscriptions; it has, however, the value of *w*; while a curious symbol 8 appears at the end of the Etruscan alphabet, and is also used in the Eugubine tables, with the value of *f*; the origin of this is uncertain. It may be a rounded form of the second symbol in the digraph FH (*i.e.*, FH) by which the sound F is indicated in a very old inscription (see *Rhein. Mus.*, xlii. 317); if this is so, the Latin alphabet has the first member of the digraph, the Etruscan has the second. Next, the symbol Υ was added (together with Z) in the 1st century B.C. to represent more exactly, in borrowed words, the sound of Greek upsilon.

Lastly, the form U was differentiated from V. It is the uncial form, and so belongs to the general transition from the pointed to the rounded character which conduced to greater convenience of writing. Examples of it may be seen in the article on PALÆOGRAPHY; see the specimen of Latin uncial of the 5th or 6th century (vol. xviii. p. 157), and the half-uncial of the Lindisfarne Gospels, about 700 A.D. (*ibid.*, p. 163). It was clearly a matter of convenience to have separate symbols to represent sounds so distinct as *u* and *v*; but the application of the two symbols seems to have been due to chance rather than design. The form V remained in use at the beginning of words, whereas *u*, which was the uncial and cursive form, naturally was used rather in the middle; by degrees the initial form was appropriated to consonants,—perhaps, as Dr. Taylor suggests (*Alphabet*, ii. 189), because the consonant is commoner at the beginning of words, or for some other reason, while the medial form was connected with vowels.

The sound which U denotes is produced by "rounding" the lips to the furthest extent consistent with a clear vowel-sound, and by raising the back of the tongue higher than for any other rounded sound. It has two varieties (like all other vowels) according as the position of the tongue is more or less tense, producing thereby a narrower or a wider aperture for the voice to pass through; whence the sounds are technically called "narrow" and "wide" respectively. The narrow sound is heard in English only when the vowel is long, as in "book," "rule," but in northern English (Scotch) "book" may be heard short. The wide sound is heard in "full," "good." The digraph *oo* is commonly used for the *u* sound, and attests the fact that the original sound of *ō* has frequently passed into *ū*, as in "good," "food," etc., written "gode," "fode" in Middle English; sometimes, however, the *oo* has come by analogy into words where *ū* is the original sound, as in "room," M.E. "roum," O.E. "rūm." Original *ū* has commonly passed into the *au* sound, spelt in English *ou* or *ow*, as in "how," "house," "mouse," "bower," for O.E. "hū," "hūs," "mūs," "būr." According to Mr. A. J. Ellis, words derived from the French had in Chaucer's time the sound of French *u*; and Sir John Cheke's statement "cum *duke*, *tuke*, *lute*, *rebuke*, δυκ, τυκ, λυτ, ρεβυκ dicimus, Græcum *v* sonaremus," seems strong for the same practice in the 16th century. In the 17th century the modern pronunciation of *u* as *iu* in "muse," "duke," "mute," "pure" had come in. Hence also we may explain the substitution of *u* for *y* in some genuine English words, as "busy" (orig. bysig). At the same time begins the corruption of *u* to the (so-called) *ŭ* sound in "but," "shut," etc.; this is not a *u* sound at all, but the neu-

tral vowel as heard indifferently in "but," "sun," "son," "blood;" it is often confounded by writers with the true *ŭ* heard in "pull" and in the northern pronunciation of "but," "shut." For the history of the German "modified" *u* (spelt ü, but originally *ue*) see under Y.

UBEDA, a town of Spain, head of an administrative subdivision in the province of Jaen, stands on a gentle slope about 5 miles from the right bank of the Guadalquivir, and about 22 miles to the east of the Menjibar station on the railway from Madrid to Cordova. Under the Moorish rule it was a place of considerable consequence, its population being said to have at one time numbered 70,000. Some portions of the old walls, with towers and gates, still remain, but none of the public buildings are of great age, the oldest church, that of San Salvador, dating from 1540–56. The population within the municipal boundaries in 1877 was 18,149.

UDAIPUR [Oodeypore] or Mewár, a native state in Rajputana, India, with an area of 12,670 square miles. It extends from 23° 49′ to 25° 58′ N. lat., and from 73° 7′ to 75° 52′ E. long., and is bounded on the N. by the British territory of Ajmere; on the E. by the native states of Bundi, Gwalior, Tonk, and Partábgarh; on the S. by Banswára, Dungarpur, and Mahi Kántha; and on the W. by the Aravalli Mountains, separating it from Marwar and Sirohi. The greater part of the country is level plain. A section of the Aravalli Mountains extends over the southwestern and southern portions, and is rich in minerals, but the mines have been long closed. The general inclination of the country is from southwest to northeast, the Banas and its numerous feeders flowing from the base of the Aravalli range. There are many lakes and tanks in the state, the finest of which is the Dhebar or Jaisamand, with an area of nearly 21 square miles; it is considered to be the largest sheet of artificial water in the world. There are only two metal roads in the state; the Nimach State Railway passes through the northeastern part.

In 1881 the population, exclusive of 51,076 Bhils, was 1,443,144 (males 772,685, females 670,459); Hindus numbered 1,321,521, Mohammedans 43,322, Jains 78,171, and Christians 130. The only town with over 10,000 inhabitants is Udaipur, the capital (38,214). This city is picturesquely situated on a lake 2000 feet above sea-level, and faces wooded hills. It contains the royal palace, which is a noble pile of granite and marble, built on the crest of a rocky ridge overlooking the lake, city, and valley. There are no manufactures of any importance in the state, and the crops as a rule only suffice for local wants. The principal imports are salt, piece goods, groceries, metals, medicines, sugar, ivory, and tobacco; and the exports are mostly confined to turmeric, gúr, cotton, indigo, til, opium, and cattle. The total income of Udaipur in 1885–86 was £259,624 [$1,261,772.64]. The state was taken under the protection of the British Government in 1817, and it pays an annual tribute of £20,000 [$97,200]. The family of the raja of Udaipur ranks highest in dignity among the Rajput chiefs of India.

UDAL (Danish *odel*) is a kind of right still existing in Orkney and Shetland, and supposed to be a relic of the old allodial mode of landholding existing antecedently to the growth of feudalism in Scotland. The udal tenant holds without charter by uninterrupted possession on payment to the crown, the kirk, or a grantee from the crown of a tribute called scat (Danish *skat*), or without such payment, the latter right being more strictly the udal right. Udal lands descend to all the children equally. They are convertible into feus at the option of the udallers.

UDALL, Nicholas (b. 1505–d. 1556[1]), author of the earliest extant regular English comedy. Udall was a typical man of the Renaissance in England, a schoolmaster by profession, a classical scholar, a translator of Terence and Erasmus, and a writer of pageants and interludes. He was high in favor at court, wrote verses for the city pageant exhibited at Anne Boleyn's coronation in 1533, and was honored by Mary in 1554 as one that had "heretofore showed and mindeth hereafter to show his diligence in setting forth of dialogues and interludes before us for our regal disport and recreation." The severity of his discipline at Eton, where he was headmaster, has been immortalized by the quaint lines of one of his pupils, Thomas Tusser. The exact history of the production of his comedy *Ralph Royster Doyster* is not known. A printed copy wanting the title-page came to light in 1818, and we know that it was licensed to be printed in 1566. It is a distinct advance in construction on the Merry Interludes of John Heywood, but it is not a comedy in the strict English sense, being, like the interludes, essentially farcical in motive, character, and incident. Although an imitation of the Latin comedy, it is far from being a servile imitation, and abounds in fresh fun and cleverness. It has been twice reprinted, —by the Shakespeare Society (with a memoir by Mr. Cooper) and in Arber's Reprints.

[1] The date of Udall's death is sometimes erroneously given as 1561, in which year his play of *Ezekias* was performed at Cambridge before Queen Elizabeth. He was buried at St. Margaret's, Westminster, on 23d December, 1556 (see memoir in Cooper's edition of *Royster Doyster*).

UDINE, a town of Italy, in the province of Udine, in a wide plain near the foot of the Carnic Alps, on the Roja, 84 miles by rail northeast from Venice and 49 miles northwest from Trieste. It is enclosed by an imposing wall of considerable antiquity, some 4 or 5 miles in circumference, and fortified with towers. In the centre, on an eminence, stands the old castle, at one time the residence of the patriarchs of Aquileia, and now used as a prison. Grouped around this is the old part of the town, with narrow crooked streets, some of which are lined with arcades. The cathedral, which is a Romanesque building with fine pillars, and an hexagonal tower bearing 14th-century sculptures, contains some interesting examples of native art (by Giovanni Martini da Udine and others). The church of S. Maria della Purità has frescos by Tiepolo. On the principal square stands the town-hall, built in 1457 in the Venetian-Gothic style, and skilfully restored since a fire in 1876; opposite is a clock tower resembling that of the Piazza di San Marco at Venice. The archiepiscopal palace and Museo Civico, as well as the municipal buildings, have some valuable paintings. Several of the palaces of the nobility have striking architectural features, and the town is adorned by many beautiful public walks. The leading industry of Udine is silk-spinning, but it also possesses manufactures of linen, cotton, hats, and paper, tanneries, and sugar refineries, and has a considerable trade. The population in 1881 was 23,254.

Udine is the *Vedinum* of Pliny; it was then a municipium, but quite an inconsiderable place compared with Forum Julii (Cividale) 11 miles to the east, or Aquileia 22 miles to south-southeast. In the Middle Ages it became a flourishing and populous city; in 1238 the patriarch Berthold made it the capital of Friuli (*q.v.*), and in 1420 it became Venetian.

UEBERWEG, Friedrich (1826–1871), best known by his *History of Philosophy*, was born on the 22d January, 1826 at Leichlingen, in Rhenish Prussia, where his father was Lutheran pastor. His mother, left early a widow, devoted her scanty means to the education of her only son. Ueberweg passed through the gymnasium at Elberfeld, and studied at the universities of Göttingen and Berlin. In 1852 he qualified himself at Bonn as privatdocent in philosophy. His *System of Logic*, published in 1857 (English translation 1871), and his essay *On the Authenticity and the Order of the Platonic Writings*, crowned by the Imperial Academy of Vienna (published 1861), contributed to draw attention to him as at once a scholar and a thinker. In 1862 he was called to Königsberg as extraordinary professor, and in 1867 he was advanced to the ordinary grade. He married in 1863, and on the 9th June, 1871, he died prematurely.

The chief work of his later years was his compendious *History of Philosophy*, which is unmatched for fulness of information combined with conciseness, accuracy, and impartiality of treatment. The first part appeared in 1862. An English translation, in two volumes, was published in 1872, and has gone through several editions. Ueberweg translated, in 1869, Berkeley's *Principles of Human Knowledge*, with notes, for Kirchmann's *Philosophische Bibliothek*. In philosophy Ueberweg was strongly opposed to the subjectivistic tendency of the Kantian system, maintaining in particular the objectivity of space and time, which involved him in a somewhat violent controversy with several opponents. His own mode of thought he preferred to describe as an ideal realism, which refused to reduce reality to thought, but asserted a parallelism between the forms of existence and the forms of knowledge. Beneke and Schleiermacher seem to have exercised most influence upon the development of his thought. A short memoir, by his friend F. A. Lange (author of the *History of Materialism*), gives some account of what may be called personal opinions in philosophy and theology, which did not find expression in Ueberweg's published writings.

UFA, a government of southeastern Russia, on the western slope of the Urals, has Vyatka and Perm on the N., Orenburg on the E. and S., Samara and Kazañ on the W., and comprises an area of 47,112 square miles. In virtue alike of its physical characters and of its population, which belongs chiefly to the Ural-Altaic stock, it forms an intermediate link between Europe and Asia, and it was only recently separated from the government of Orenburg, which is now limited to the eastern slopes of the Urals. Several craggy and densely wooded ridges, running from southwest to northeast parallel to the main chain of the southern Urals, occupy its eastern part. They are separated by broad and long longitudinal valleys, and rise to altitudes of from 2500 to 3500 feet above the sea; their highest peaks—Iremel (5040 feet), Nurgush, Urenga, and Taganai (3950 feet)—are above the limits of tree-vegetation, but in no case reach those of perpetual snow. The high longitudinal valleys of the Urals are the seat of an important mining industry. Southward Ufa extends over the slopes of the Obshchiy Syrt plateau, the angular space between the latter and the Urals being occupied by elevated plains (from 1000 to 1500 feet), deeply grooved by the river valleys and sometimes described as the "Ufa plateau." It slopes gently towards the depression of the Kama; and its undulating surface, especially its broad valleys (500 to 600 feet above the sea), covered as they are with a fertile soil, are being rapidly colonized by Russian settlers. Towards the Kama the fertility of the soil increases, and the black earth regions of Menzelinsk and Birsk may be described as granaries for that part of Russia.

The geological structure of Ufa is very varied. The main ridge of the Urals consists of gneisses and various crystalline slates resting upon granites and syenites; next comes a broad slip of limestones and sandstones, the fossil fauna of which is intermediate in its lowest parts between the Upper Silurian and the Lower Devonian. These form the highest ridges of Ufa. Farther west the Devonian deposits are followed by Lower and Upper Carboniferous and "Artinsk schists," which, together with Permian deposits, cover western Ufa. Quaternary deposits are extensively developed in all the valleys, most of which were occupied by lakes during the Lacustrine period. Ufa has not the mineral resources of Perm; only traces of gold have been found in its valleys, and silver ores are absent; but its wealth in iron (Devonian) and copper (Permian) seems likely to have great mining importance in the future. The district of Zlatoust is celebrated for its granite, epidote, nephrite, and a variety of decorative stones and minerals. Coal is spread over a wide area, but only in layers too thin to make working remunerative. Fire-clay, kaolin, and sandstone for making grindstones are obtained to some extent; naphtha, sulphur, and saltpetre have been observed in several places.

Ufa belongs almost entirely to the drainage area of the Byelaya, a great tributary of the Kama, which rises in Orenburg, flows south and west till it pierces a mountain chain at Bugutchan, and then runs north and northwest, watering the high plains and receiving a number of important tributaries, among which the Sim, the Tanyp, and the Ufa are also navigable. The banks of the Byelaya are thickly peopled, and it is an important channel for trade; but it sometimes reaches so low an ebb in summer that steamers cannot proceed beyond Birsk. The Kama flows for 120 miles along the western border of the government. Marshes lie along its course, so that its banks are but thinly inhabited. Forests cover nearly half the area, but the plains on the left of the Byelaya are comparatively thinly wooded. The climate of Ufa is very continental. The average temperature at Ufa is 37° F., and the winter is extremely cold (January 5.5° F., July 68° F.); at the Zlatoust observatory (1340 feet) the average temperature is only 32.2° (January 2°; July 61.8°). Even in the hilly tracts of Zlatoust the annual rainfall is only 19 inches. The rivers are frozen 158 days at Ufa, and 202 about Zlatoust.

The population of Ufa is now rapidly increasing (1,793,260 in 1882, as against 1,291,020 in 1865). Only one-third of the whole is Russian, the remainder being chiefly Bashkirs (50 per cent., including Meschcriaks and Tepters), Tatars (8.4 per cent.), Tcheremisses, Tchuvashes, Mordvinians, and Votiaks. In the south the Bashkirs, Tatars, and other Ural-Altaians constitute two-thirds of the population. Among the Russians two distinct elements must be distinguished,—some 100,000 peasants, who formerly were mining serfs, and now support themselves chiefly by work in or for the mines, and nearly 620,000 agriculturists, for the most part more recent immigrants. The latter carry on agriculture on an extensive scale, and export large quantities of corn. The Bashkirs are chiefly cattle-breeders, but of late they have been driven more and more to tillage, owing to the appropriation by speculators of their extensive pasture-lands. Bee-keeping is largely carried on, and hunting is still an important source of income to the Bashkirs. In the northeast the trade in timber and the manufacture of various wooden wares are largely engaged in by the peasantry. The mining industry is advancing, notwithstanding many obstacles (see vol. xxi. p. 93); the iron-works of Zlatoust especially have a wide reputation. Flour-mills, distilleries, and tanneries come next in importance. The exports of corn, linseed, timber, wooden wares, metals, tallow, hides, and cattle are considerable, and trade is active, especially at the fairs of Menzelinsk, Ufa, and Zlatoust.

There are six administrative districts, the chief towns of which (with populations in 1884) are—Ufa (25,660), Belebei (4200), Birsk (8000), Menzelinsk (6100), Sterlitamak (8940), and Zlatoust (18,990). The leading places Tchelny and Berezovka on the Kama, and several iron and copper works (Satkinsk, Yurezañ, Katav-Ivanovsk, about 6000 inhabitants each) ought also to be mentioned.

UFA, capital of the above government, is situated at the confluence of the Ufa with the Byelaya, on high crags intersected by ravines, which are covered with gardens and orchards. The better part of the town contains a few stone buildings connected with the administration, two cathedrals, and a few churches; the remainder is a scattered aggregation of small wooden houses. There are two classical gymnasiums for boys and girls, a theological seminary, and several lower schools. The town has a few good hospitals. The manufactures are insignificant in Ufa itself, but there are several iron and copper works of importance within the district. Owing to the fertility of the neighboring regions, and the position of the town at the junction of two important rivers, the Ufa merchants carry on a brisk export trade. The population has rapidly increased of late, reaching 25,660 in 1884.

Ufa was founded in 1574, when a fort was built on the Byelaya, three other forts being erected about the same time at Birsk, Menzelinsk, and Berezovka, to connect Ufa with the Russian settlements on the Kama. The wooden kreml of Ufa, protected by wooden towers and an outer earthen wall, had to sustain the attacks of the revolted Bashkirs and Russian serfs in 1662 and at later dates; and in 1773 Tchika, one of the chiefs of the Pugatcheff revolt, besieged it for four months.

UGANDA, a country of eastern Central Africa, to the northwest of the Victoria Nyanza. It has an area of about 34,000 square miles, extending from 1° N. lat. to the Kitangule river, and from 31° E. long. to the Nile. The country bordering the lake and to the northwest is mountainous, the mountains being arranged in low parallel chains. The hills, covered with

splendid timber and abundant underwood, rise to a height of 400 feet above their valleys, through which sluggish streams flow to the lake. Farther north the country becomes a plain, and the eastern portion of Uganda, between Rubaga and the Nile, consists of undulating country, varied by deep narrow valleys. The geological formation of the country is volcanic or metamorphic; two or three feet of rich black alluvial soil form the upper strata, covering a bed of red sandy clay, often 30 feet thick. In some places porcelain earth is found, as well as large masses of mica. Ironstone is present in considerable quantities, but as yet no other metals have been discovered. The climate is mild, and the temperature remarkably uniform throughout the year; the thermometric range is from 50° to 90° F.; but the mean annual variation is only 20°. The annual rainfall is 50 inches, the greatest amount of rain occurring in March, April, May, and September, October, and November, when rain falls nearly every day, thunderstorms being frequent.

The population of Uganda is about five millions. The men are tall and well-built, and have good features and dark chocolate-colored skin, with woolly hair. The women in their youth are good-looking. The country is divided into three provinces—Uddu in the south, Siugo in the west, and Changwe in the east, to which must be added about 400 islands in the lake. The government of the country is feudal, the king being nominally supreme. Succession to the throne is hereditary, but the successor is usually a minor chosen by three hereditary chiefs, who with the young king's mother carry on the government until he is of age. The reiguing family in Uganda is descended from the Wahuma tribe; the late king Mtesa professed to trace back his descent to Kintu (or Ham), the founder of the dynasty. The country is ruled by the king, three hereditary chiefs, and a council of minor chiefs,—two hereditary chiefs and a certaiu proportion of the others being continually in residence at Rubaga, the capital of the country. The laws are strict, and the administration of justice is conducted in au orderly manner. There is no real taxation, but the people are compelled to render feudal service to all their superiors. The Waganda may be divided into four classes, the lowest class being the slave population, consisting of prisoners taken in war and their descendants; next come the "bachopi" or peasants, who form the mass of the population; the third class are the "batongoli," or chiefs, who are recruited from the bachopi, but whose honors are not hereditary; they receive their rank for distinguished bravery in the field or for services rendered to the state, and they are the governors of the villages. The highest class is that of the "bakungu," a superior grade of chiefs, all belonging to the "lukiko" or state council, and being governors of large districts of land. The three great hereditary chiefs belong to this class, and they are supreme governors of the three great districts into which Uganda is divided. The Waganda are very warlike; all adult males are compelled to serve in the army when required, and the military organization, having its headquarters at the capital, ramifies throughout the whole land. Game is very plentiful, elephants, buffaloes, zebras, rhinoceroses, wild boars, twelve species of antelopes, lions, leopards, jackals, foxes, hyenas, hares, chimpanzees, and several species of monkeys inhabit the forest. Snakes are numerous, hippopotami, crocodiles, and otters abound in the lake and in the Nile, as also many water-rats. The principal birds are parrots, guinea-fowl, owls, vultures, adjutants, goatsuckers, kites, eagles, ducks, geese, storks, cranes, herons, gulls, scarlet flamingos, darters, the sacred and glossy ibis, and brilliantly colored honey-birds. The principal insects are mosquitos, fleas, locusts, white and driver ants, and butterflies of many species. The domestic animals are cows, goats, and a few sheep and dogs. The Waganda live chiefly upon a vegetable diet, the banana forming the staple food; it grows everywhere, and requires little or no cultivation. The sweet potato is the chief vegetable cultivated, but coffee, sugar-cane, cassava, maize, sesame, millet, tullabone, several species of beans, and two or three kinds of pumpkins are grown to a small extent. The principal fruits are the mpafu and a species of amomum. Strangers have introduced wheat, rice, guavas, papaws, pomegranates, tomatoes, onions, and radishes. Wine is made from the banana tree, and is a staple drink. Butter and cheese are also made. A good deal of manufacture is carried on, for the people are ingenious and clever workmen, and their work is tasteful, neat, and exact. Two kinds of pottery, a coarse and a fine variety, are manufactured in considerable quantities. The basket work is extremely good, and the metal work far superior to any seen among the neighboring tribes. The manufacture of bark-cloths, in which most of the people are clothed, is very extensively carried on, and their wood-work and boat-building are of very superior quality. Tanning, dyeing, and bead-work employ numbers of the people. There is not very much home trade in Uganda; it is limited to the barter of native manufactures. Several times a year caravans arrive from Zanzibar, bringing calico, guns, powder, files, knives, etc. The standard value of any article is reckoned by 100 cowries or an arm's length of calico and beads; hoes, salt, and fish are also employed as mediums of exchange. The language spoken in Uganda belongs to the great Bantu family, and is very rich in words. It has ten classes of nouns, the noun being the most important part of speech. Grammatical inflections are formed by prefixes; the inflections of verbs, adjectives, and pronouns vary according to the class of the governing noun. Adjectives agree with the substantive in number and case, and always follow the noun. There are personal, possessive, relative, demonstrative, and interrogative pronouns, and several forms of verbs. The Waganda are very good arithmeticians. The root of all multiples is ten; tallies are used as aids to the memory. The people are very musical; their voices are clear and melodious, and of considerable range. They have a great variety of tunes,—orchestral, dance, and vocal music having distinct characteristics. Their musical instruments consist of harmonicons, rattles, drums, horns, whistles, flutes, and harps. The Waganda have no images or outward symbols of their gods; and they think that the world is ruled by spirits or demons, to whom Katonga, the great creator, has deputed his power. They worship Mukasa, the god of the lake; Naduala, the god of small-pox; Chiwuka and Nenda, the gods of war; and several of the former monarchs of Uganda, who are believed to be demi-gods. A thunder spirit is also invoked. The gods of war are supposed to inhabit certain trees, and offerings are made to them before entering the war-path; like offerings are also made to the god of the lake before commencing a voyage upon its waters.

The Waganda are courteous, cleanly, given to hospitality, but drunken, and to a certain extent indolent. Their standard of morality, even judged by that of the surrounding tribes, is not high. Human life is little respected; they are untruthful and indecent. Unless moved by passion, they are not cruel; passionate, they are not revengeful. Children are well treated, as are the aged men. On account of the extensive prevalence of polygamy, women occupy a somewhat low social grade.

Uganda was first visited by Speke and Grant in 1860, and the country has since been visited by numerous Europeans, chiefly missionaries. The Church Missionary Society and the Roman Catholics have mission stations in the country. In 1886 some forty of their converts were burnt at the stake, and in the same year Bishop Hannington was murdered on the borders of the country by the orders of King Mwanga.

See Speke's *Journal*, Grant's *Walk across Africa*, Stanley's *Through the Dark Continent*, and Wilson and Felkin's *Uganda and the Egyptian Soudan*. Also a monograph "On the Waganda tribe," by R. W. Felkin, in *Proc. Roy. Soc. Ed.*, vol. xiii., and an *Outline Grammar of the Luganda Language*, by C. T. Wilson.

UGLITCH, a district town of Russia, in the government of Yaroslavl, is situated on the upper Volga, principally on its right bank, 67 miles to the west of the capital of the province. Its historical remains are mostly associated with the prince Dmitri (see vol. xxi. pp. 101–2). The wooden house he occupied, a church of St. Demetrius "on the Blood" erected at the spot where he was killed, and a kiosk on the site of the convent where his mother was forcibly consecrated a nun,—all commemorate this chapter in the history of the rule of the boiars at Moscow at the beginning of the 17th century. An old cathedral, erected in the 13th century but subsequently restored, and containing the grave of Prince Roman, recalls a still earlier period of municipal independence. Uglitch has now become a commercial and industrial city with 11,930 inhabitants (1883), and has an important trade, being one of the chief loading places on the upper Volga. Its industries comprise the sewing of sacks for corn and flour (about one million every year) and the knitting of woollen socks; and it has a paper-mill, distilleries copper-works, and linen factories. Corn, paper, sausages (with which the name of Uglitch has long been associated), candles, etc., are shipped at the town.

Uglitch is one of the oldest towns of Russia; its local annals go as far back as the 9th century. Until the 14th century it maintained its independence as a separate principality, which extended over eastern Tver, and elected its own princes. In 1329 the sons of Prince Roman the Saint renounced their independence in favor of Moscow, and fifty years later the Uglitch princes finally sold their rights to the great prince of Moscow. The Tartars plundered the town during their invasions of 1237, 1293, and 1408, as also did the Lithuanians at a later date.

UHLAND, JOHANN LUDWIG (1787–1862), German poet, was born at Tübingen, on April 26, 1787. He studied at the university of his native place, taking jurisprudence as his special subject, but also devoting much time to literature. Having graduated as a doctor of laws in 1810, he went for some months to Paris; and from 1812 to 1814 he worked at his profession in Stuttgart, in the bureau of the minister of justice. He had begun his career as a poet in 1807 and 1808 by contributing ballads and lyrics to Seckendorf's *Musenalmanach;* and in 1812 and 1813 he wrote poems for the *Poetischer Almanach* and for the *Deutscher Dichterwald.* In 1815 he collected his poems in a volume entitled *Gedichte*, which almost immediately secured a wide circle of readers, and gives him his place in German literature. To every new edition he added some fresh poems; and the sixtieth edition, published in 1875, included a number of pieces found among his papers. He wrote two dramatic works—*Ernst, Herzog von Schwaben* and *Ludwig der Baier* —the former published in 1817, the latter in 1819. These, however, are unimportant in comparison with his *Gedichte.* In some respects Uhland must be classed with the writers of the romantic school, for, like them, he found in the Middle Ages the subjects which appealed most strongly to his imagination. But his style has a precision, suppleness, and grace which sharply distinguish his most characteristic writings from those of the romantic poets. His best lyrics have the charm which belongs to the unaffected expression of delicate sentiment; and in almost all his ballads he displays a remarkable power of giving picturesque form to his conceptions of character. He was a man of pure and noble impulse, and it was in presenting scenes which awaken love, or admiration, or pity that he did the fullest justice to his powers. Uhland's poetic sympathy with some characteristics of the age of chivalry did not prevent him from sharing the best aspirations of his own time. He wrote manly poems in defence of freedom, and in the states assembly of Würtemberg he played a distinguished part as one of the most vigorous and consistent of the liberal members. In 1829 he was made a professor, at Tübingen university, of German literature and the German language, but he resigned this appointment in 1833, when it was found to be incompatible with his political duties. In 1848 he became a member of the Frankfort parliament, in which he sat as one of the most respected members of the liberal party.

Uhland was not only a poet and politician; he was also an ardent student of the history of literature. In 1812 he published an interesting essay on *Das altfranzösische Epos;* and ten years afterwards this was followed by an admirable work on Walther von der Vogelweide. He was also the author of an elaborate study of *Der Mythus von Thôr nach nordischen Quellen* (1836), and he formed a valuable collection of *Alte hoch- und niederdeutsche Volkslieder*, which appeared in 1844–45. He died on November 13, 1862. After his death his prose works were reprinted, with some additions, under the general title *Uhland's Schriften zur Geschichte der Dichtung und Sage* (1865–73), and an edition of his poems and dramas, in three volumes, was issued in 1863.

See Liebert, *Ludwig Uhland, eine Skizze* (1863); Mayer, *Ludwig Uhland, seine Freunde und Zeitgenossen* (1867); and *Ludwig Uhland's Leben, aus dessen Nachlass und aus eigener Erfahrung zusammengestellt von seiner Witwe* (1874).

UJIJI, a town in eastern Central Africa, of considerable importance, also known by the name of KAVELE, is situated on the eastern shores of Lake Tanganyika, in 4° 55′ S. lat. and 30° 5′ E. long. It is the chief town on that lake, and is the centre of a brisk trade in ivory. Formerly it was a great slave-market. The town is of a straggling character, Arab houses of sun-dried bricks being mingled with native huts. The population, which fluctuates considerably, is very mixed, being composed of Arabs and the representatives of numerous Central African tribes. Ujiji has been visited by various European travellers, who have made it their headquarters, and it was here that Stanley found Livingstone, on October 28, 1871. Opinions vary as to the salubrity of its climate, but the balance of testimony appears to prove that during the greater part of the year it is very unhealthy.

UJJAIN, or OOJEIN, a town in the native state of Gwalior, central India, situated on the right bank of the Sipra, in 23° 11′ 10″ N. lat. and 75° 51′ 45″ E. long., 1698 feet above sea-level. In ancient times Ujjain was the great and famous capital of Málwá, one of the seven sacred cities of the Hindus, and the spot which marked the first meridian of Hindu geographers. Though much decayed, it is still a large and populous city, with considerable commerce. The modern city is surrounded on all sides by an almost uninterrupted belt of groves and gardens. In 1881 the population of the town numbered 32,932. Its trade consists chiefly in the export of opium and the import of European goods, especially cotton fabrics.

UKRAINE ("frontier"), the name formerly given to a district of European Russia, now comprising the governments of KHARKOFF, KIEFF, PODOLIA, and POLTAVA (*q.v.*).

ULCER. See SURGERY, vol. xxii. p. 717.

ULFILAS (311–381), the apostle of Christianity to the Gothic race, and, through his translation of the Scriptures into Gothic, the father of Teutonic literature, was born among the Goths of the trans-Danubian provinces in the year 311.[1] There is a tradition that his ancestors were Christian captives from Sadagolthina in Cappadocia, who had been carried off to the lands beyond the Danube in the Gothic raid of 267; but the evidence on which this rests is inadequate. An authoritative record of the outlines of his life has only been discovered within the last fifty years, in a writing of Auxentius, his pupil and companion.

At an early age Ulfilas was sent, either as an envoy or as a hostage for his tribe, to Constantinople, probably on the occasion of the treaty arranged in 332. During the preceding century Christianity had been planted sporadically among the Goths beyond the Danube, through the agency in part of Christian captives, many of whom belonged to the order of clergy, and in part of merchants and traders. Ulfilas may therefore have been a convert to Christianity when he reached Constantinople. But it was here probably that he came into contact with the Arian doctrines which gave the form to his later teaching, and here that he acquired that command over the Greek and Latin tongues which equipped him for his labors as a translator. For some time before 341 he worked as a "lector" or reader of the Scriptures, probably among his own countrymen in Constantinople, or among those attached as *fœderati* to the imperial armies in Asia Minor. From this work he was called to return as missionary bishop to his own country, being ordained by Eusebius of Nicomedia and "the bishops who were with him" in 341. The ordination of Ulfilas as missionary bishop by the chiefs of the semi-Arian party is at once an indication of their determination to extend their influence by active missionary enterprise

[1] Krafft gives 313 as the date, Waitz 318.

and evidence that Ulfilas was now, if he had not been before, a declared adherent of the Arian or semi-Arian party. He was now thirty years of age, and his work as "bishop among the Goths" covered the remaining forty years of his life. For seven of these years he wrought among the Visigoths beyond the Danube, till the success which attended his labors, and the growing numbers of his flock, drew down the persecution of the still pagan chief of the tribe. This "sacrilegus judex" has been identified with Athanaric, a later persecutor, probably without sufficient ground. The persecution was so severe that, to save his flock from extinction or dispersion, Ulfilas decided to withdraw both himself and his people from its range. With the consent of the emperor Constantius he led them across the Danube, "a great body of the faithful," and settled in Mœsia at the foot of the range of Hæmus, and near the site of the modern Tirnova (348). Here they developed into a peace-loving pastoral people.

The life of Ulfilas during the following thirty-three years is marked only by one recorded incident, his visit to Constantinople in 360, to attend the council convened by the Arian or Homoian party. His work and influence were not, however, confined to his own immediate flock, but radiated by means of his writings (homilies and treatises), and through the disciples he despatched as missionaries, among all the tribes of the Gothic stock beyond the Danube. By this time probably he had made some progress with his version of the Scriptures, and copies of parts of it would begin to circulate. Thus the church beyond the Danube, which had not been extinguished on Ulfilas's withdrawal, began to grow once more in numbers and importance, and once more had to undergo the fires of persecution. Catholic missionaries had not been wanting in the meanwhile, and in the indiscriminate persecution by Athanaric between 370 and 375 Catholics and Arians stood and fell side by side. The religious quarrel either accentuated, or was accentuated by, political differences, and the rival chiefs, Athanaric and Frithigern, appeared as champions of Paganism and Christianity respectively. Then followed the negotiations with the emperor Valens, the general adhesion of the Visigoths under Frithigern to Arian Christianity, the crossing of the Danube by himself and a host of his followers, and the troubles which culminated in the battle of Adrianople and the death of Valens (378). The part played by Ulfilas in these troublous times cannot be ascertained with certainty. It may have been he who, as a "presbyter Christiani ritus" conducted negotiations with Valens before the battle of Adrianople; but that he headed a previous embassy asking for leave for the Visigoths to settle on Roman soil, and that he then, for political motives, professed himself a convert to the Arian creed, favored by the emperor, and drew with him the whole body of his countrymen,—these and other similar stories of the orthodox church historians appear to be without foundation. The death of Valens, followed by the succession and the early conversion to Catholicism of Theodosius, dealt a fatal blow to the Arian party within the empire. Ulfilas lived long enough to see what the end must be. Hardships as well as years must have combined to make him an old man, when in 381 he was sent for to Constantinople. The emperor had summoned him, for what purpose cannot be clearly ascertained. A split seems to have taken place among the Arians at Constantinople. Party riots were too familiar there, and a fierce dispute over a theological dogma, however abstruse, placed the peace of the city, if not the security of the palace, in jeopardy. Ulfilas was summoned to meet the innovators, and either by argument or by influence to induce them to surrender the opinion which caused the dispute. His pupil Auxentius describes how, "in the name of God," he set out upon his way, hoping to prevent the teaching of these new heresies from reaching "the churches of Christ by Christ committed to his charge." No sooner had he reached Constantinople than he fell sick, "having pondered much about the council," and before he had put his hand to the task which had brought him he died, probably in January, 381. A few days later there died, also in Constantinople, his old enemy and persecutor, Athanaric.

The Arianism of Ulfilas was a fact of pregnant consequence for his people, and indirectly for the empire. It had been his lifelong faith, as we learn from the opening words of his own testament—"Ego Ulfilas semper sic credidi." If, as seems probable from the circumstances of his ordination, he was a Semi-Arian and a follower of Eusebius in 341, at a later period of his life he departed from this position, and vigorously opposed the teaching of his former leader. He appears to have joined the Homoian party, which took shape and acquired influence before the council of Constantinople in 360, where he adhered with the rest of the council to the creed of Ariminum, with the addendum that in future the terms *ὑπόστασις* and *οὐσία* should be excluded from Christological definitions. Thus we learn from Auxentius that he condemned Homoousians and Homoiousians alike, adopting for himself the Homoian formula, "filium similem esse patri suo." This Arian form of Christianity was imparted by Ulfilas and his disciples to most of the tribes of the Gothic stock, and persisted among them, in spite of the persecution, hatred, and political disasters it involved, for two centuries.

The other legacy bequeathed by Ulfilas was of less questionable value. His version of the Scriptures (see GOTHIC LANGUAGE, vol. x. p. 757) is his greatest monument as a way-breaker and a scholar. By it he became the first to raise a barbarian tongue to the dignity of a literary language; and the skill, knowledge, and adaptive ability it displays make it the crowning testimony of his powers as well as of his devotion to his work.

The personal qualities of the man may be inferred from his pupil's description of him as "of most upright conversation, truly a confessor of Christ, a teacher of piety, and a preacher of truth,—a man whom I am not competent to praise according to his merit, yet altogether keep silent I dare not."

A. Scott, *Ulfilas, Apostle of the Goths*, 1885. See also "Gothic Language" under GOTHS. (C. A. S.)

ULM, an ancient and important commercial town in Würtemberg, and an imperial fortress of the first class, is situated on the left bank of the Danube, in a fertile plain at the foot of the Swabian Alps, 45 miles to the southeast of Stuttgart and 63 miles to the northwest of Munich. The town, quaintly built with narrow and confined streets, still preserves the dignified and old-fashioned appearance of an ancient imperial town, and contains many mediæval buildings, both of historic and of artistic interest. Among these, besides numerous handsome private houses, are the town-house, of the 16th century, in the Transition style from late Gothic to Renaissance; the Kornhaus and market-buildings; the Ehingerhaus or Neubronnerhaus, now containing the industrial museum; the "new building," erected in 1603 on the site of a palace of Charlemagne; and the commandery of the Teutonic order, built in 1712–18 on the site of a habitation of the order dating from the 13th century. By far the most important and conspicuous building in Ulm, however, is the magnificent early Gothic cathedral, next to the cathedral of Cologne the largest church in Germany, and capable of containing 30,000 people. Begun in 1377, and carried on at intervals till the 16th century, the building was long left unfinished; but in 1844 the work of restoration and completion was undertaken, and has steadily progressed ever since. Ulm cathedral has double aisles and a pentagonal apsidal choir, but no transepts. Its length (outside measurement) is 464 feet, its breadth 159 feet; the nave is 136 feet high and 47½ wide; the aisles, which are covered with rich net-vaulting, are 68 feet in height. The massive and richly decorated square tower in the centre of the west façade, for

centuries terminated by a temporary spire, is now being completed according to the original plans, by the addition of an octagonal story and a tall open spire, which is to be carried up to the height of 534 feet. The towers of the choir have also been rebuilt in the course of the present restoration; they are 282 feet high. The interior, which is unusually well lighted, produces an impression of much dignity from the great height of the nave, the absence of obtrusive decoration, and the massive manner in which the walls and piers are treated. It contains some fine stained glass, the largest organ in Germany (1856), and a number of interesting old paintings and carvings by Syrlin, Engelberger, and other masters of the Swabian school. The cathedral belongs to the Protestant Church. Trinity Church dates from 1617–21; and there are also a Roman Catholic church and a modern synagogue in the town. The Danube, joined by the Iller just above the town and by the Blau just below, becomes navigable at this point, so that Ulm occupies the important commercial position of a terminal river-port. The trade, especially in wood and grain, has an upward tendency; and the Ulm market for leather and cloth is also rising in importance. Ulm is famous for its vegetables (especially asparagus), barley, beer, pipe-bowls, and sweet cakes (Ulmer Zückerbrot). Bleaching, brewing, and brass-founding are carried on, as well as a large miscellany of manufactures, including hats, metal goods, agricultural implements, tobacco and cigars, cement, paper, and chemicals. The population in 1886 was 33,611.

The various routes which converge at Ulm have made it at all times a strategic point of great importance, and it has long been a fortress of the first rank. In 1844–59 the German Confederation carefully fortified it with walls, ramparts, and ditches, and in 1876 the new German empire added a very comprehensive outer girdle of detached forts, culminating in the powerful citadel of Wilhelmsburg. The defensive works embrace also the Bavarian town of Neu-Ulm (7823 inhabitants), on the opposite bank of the Danube, united with the older city by two stone bridges. Ulm is thus the basis of operations for the German army behind the Black Forest, and can easily shelter a force of 100,000 men; its peace garrison is 5600.

Ulm is mentioned as early as the year 854. It subsequently became a free imperial city, and the leading town in Swabia. In the 15th century it attained the summit of its prosperity, and ruled over a district of many square miles, with a population, rural and urban, of about 60,000. Towards the end of the Middle Ages it frequently appears at the head of various Swabian leagues. In 1530 it adopted the Augsburg Confession. In 1803 it passed to Bavaria, and in 1810 to Würtemberg. In 1805 General Mack, with 33,000 Austrians, capitulated to Napoleon at Ulm. Ulm is remarkable in the history of German literature as the spot where the "meistersänger" lingered longest, preserving, without text and without notes, the traditional lore of their craft. In 1830 there were twelve "meistersänger" alive at Ulm; but in 1839 the four survivors formally made over their insignia and guild property to a modern singing society, and closed the record of "Meistergesang" in Germany. The last formal meeting of the Nuremberg "meister" took place in 1770.

ULPIANUS, Domitius, Roman jurist, was of Tyrian ancestry, but the time and place of his birth are unknown. He made his first appearance in public life as assessor in the *auditorium* of Papinian and member of the council of Septimius Severus; under Caracalla he was master of the requests. Elagabalus deprived him of his functions and banished him from Rome, but on the accession of Alexander (222) he was at once recalled and reinstated, and finally became the emperor's chief adviser and præfectus prætorio. His curtailment of the privileges granted to the prætorian guard by Elagabalus provoked their enmity, and several times he only narrowly escaped their vengeance; ultimately, in 228, he was murdered in the palace, in the course of a riot between the soldiers and the mob.

Ulpian's period of literary activity extended from about 211 to 222 A. D. His works include *Ad Sabinum*, a commentary on the *jus civile* in over fifty books; *Ad Edictum* a commentary on the Edict, in eighty-three books; collections of Opinions, Responses, and Disputations; books of Rules and Institutions; treatises on the functions of the different magistrates,—one of them, the *De Officio Proconsulis Libri X.*, being a comprehensive exposition of the criminal law; monographs on various statutes, on testamentary trusts, and a variety of other works. His writings altogether have supplied to Justinian's *Digest* about a third of its contents, and his commentary on the Edict alone about a fifth. As an author he is characterized by doctrinal exposition of a high order, judiciousness of criticism, and lucidity of arrangement, style, and language. *Domitii Ulpiani Fragmenta*, consisting of twenty-nine titles, were first edited by Tilius (Paris, 1549). There are modern editions by Hugo (Berlin, 1834) and Böcking (Bonn, 1836), the latter containing fragments of the first book of the *Institutiones* discovered by Endlicher at Vienna in 1835.

ULRICI, Hermann (1806–1884), one of the most active philosophical writers in Germany since Hegel's death, was born at Pförten, Prussia, on March 23, 1806. Educated for the law, he gave up his profession upon the death of his father in 1829, and after four years of further study, devoted to literature, philosophy, and science, qualified as a university lecturer. In 1834 he was called to a professorship at Halle, where he remained till his death on the 11th January, 1884. His first works were in the domain of literary criticism. His treatise *On Shakespeare's Dramatic Art* (1839) has been translated into English. In 1841 he published a work *Ueber Princip u. Methode der Hegelschen Philosophie*, in which he subjected Hegel's system to a severe criticism. The critical attack was continued in the *Grundprincip der Philosophie* (1845–6), which at the same time expounds his own speculative position; to this must be added as complementary his *System der Logik* (1852). His later works, dealing with perennial problems of philosophy, have found a more extended circle of readers. Such as *Glauben und Wissen* (1858), *Gott und die Natur* (1862, 3d ed. 1875), *Gott und der Mensch* (2 vols., 1866–73, 2d ed. 1874). From 1847 onward Ulrici was associated with the younger Fichte in the editorship of the *Zeitschrift für Philosophie.*

His philosophical standpoint may be characterized as a reaction from the pantheistic tendency of Hegel's idealistic rationalism towards a more pronouncedly theistic position. The Hegelian identity of being and thought is also abandoned and the truth of realism acknowledged, an attempt being made to exhibit idealism and realism as respectively incomplete but mutually complementary systems. Ulrici's later works, while expressing the same views, are largely occupied in proving the existence of God and the soul from the basis of scientific conceptions, and in opposition to the materialistic current of thought then popular in Germany.

ULSTER. See Ireland.

ULTRAMARINE, a magnificent blue pigment, which occurs in nature as a proximate component of Lapis Lazuli (*q.v.*). Lapis lazuli has long been known as a precious stone, and highly valued as such, and as early at least as the 11th century the art of extracting a blue pigment from it was practiced. From the beginning of the 16th century this pigment began to be imported into Europe from "over the sea," as *azurrum ultramarinum*. To extract it, the stone, after having been powdered coarsely, is heated to redness and thrown into cold-water to facilitate its conversion into a very fine powder, which is next treated with dilute acetic acid to remove the carbonate of lime which is present in almost all specimens. The insoluble blue residue is mixed up into a "dough" with a composition of resin, pitch, and linseed oil, and this dough is then kneaded under water, which is renewed as long as it runs off with a blue color. The blue liquor, when allowed to stand, deposits a fine precipitate, which is collected, washed, dried and sold as ultramarine. As the yield amounts to only 2 to 3 per cent. of the mineral used, it is not surprising to learn that the pigment used to be weighed up with gold. It was valued chiefly on account of its brilliancy

of tone and its inertness in opposition to sunlight, oil, and slaked lime (in fresco-painting).

Lapis lazuli has the composition of a double silicate of lime and soda combined with sulphates and sulphides of the metals named. Of the many analyses made (compare LAPIS LAZULI) we quote the following, carried out by Schultz in Rammelsberg's laboratory: combined sulphur (not SO_3), 3.16; combined sulphuric acid, SO_3, 5.67; silica, 43.26; alumina, 20.22; oxide of iron, calculated as Fe_2O_3, 4.20; lime, 14.73; soda, 8.76.

In 1814 Tassaer observed the spontaneous formation of a blue compound, very similar to ultramarine, if not identical with it, in a soda-furnace at St. Gobain, which caused the "Societe pour l'Encouragement d'Industrie" to offer a prize for the artificial production of the precious color. The problem was solved almost simultaneously by Guimet and by Christian Gmelin, then professor of chemistry in Tübingen; but while Guimet kept his process a secret (it has indeed never become known) Gmelin published his, and thus became the originator of an industry which flourishes to this day chiefly in Germany. There are very few ultramarine works in other countries, and none, as far as we know, in Great Britain. The raw materials used in the manufacture are—(1) iron-free kaolin, or some other kind of pure clay, which should contain its silica and alumina as nearly as possible in the proportion of $2SiO_2 : Al_2O_3$ demanded by the formula assigned to ideal kaolin (a deficit of silica, however, it appears can be made up for by addition of the calculated weight of finely divided silica); (2) anhydrous sulphate of soda; (3) anhydrous carbonate of soda; (4) sulphur (in the state of powder); and (5) powdered charcoal or relatively ash-free coal, or colophony in lumps. The numerous modes of manufacture may be viewed as modifications or combinations of three processes.

(1) In the *Nuremberg process* the soda is used as sulphate, or partly as such and partly as carbonate. The following recipe gives an idea of the proportions in which the materials are used: kaolin (calculated as anhydrous matter) 100 parts; calcined sulphate of soda 83 to 100 (or 41 of sulphate and 41 of carbonate); charcoal 17; powdered sulphur 13. These ingredients are mixed most intimately; they are then rammed tight into fire-clay crucibles and kept at a nearly white heat for 7 to 10 hours, access of air being prevented as far as possible. The product obtained is a grayish or yellowish green mass, which is soaked in and washed with water; the porous residue is ground very fine in mills, again washed, dried, and again ground in the dry state and passed through sieves. The product at this stage has a green color, and is sometimes sold as "green ultramarine," although it has not a high standing amongst green pigments. For its conversion into blue ultramarine it is heated with sulphur in the presence of air to a relatively low temperature. Of the various apparatus used for this important stage of the manufacture, the easiest to describe is a large muffle, heated from the outside. On its floors the green ultramarine is spread out to a depth of 2½ to 3 inches, and heated (with closed doors) to a temperature at which sulphur powder when thrown in catches fire spontaneously. This temperature being maintained, a shovelful of sulphur is thrown in and allowed to burn off while the mass is being constantly agitated with iron rakers. Another dose of sulphur is then added, and so on until a sample taken out is found to have come up to the highest attainable brilliancy and depth of blue. The product is then lixiviated with water, which removes a deal of sulphate of soda formed in the process; it is then ground up very fine, and finally subjected to elutriation to produce a graduated series of ultramarines of different degrees of fineness. In some works the process of sulphuration is divided into two or more periods, after each of which the product is washed, dried, and ground before being returned to the muffle to produce a higher degree of homogeneity.

(2) In the *carbonate of soda process* the soda is used solely, or at least principally, in the carbonate form. The following is one of many recipes: kaolin (calculated as anhydrous matter) 100; carbonate of soda 100; charcoal 12; sulphur 60. The mixture is heated in a reverberatory furnace to form in the first instance a white mass, which is so porous that it readily passes, by oxidation, into green and partly even into blue ultramarine. Green ultramarine, salable as such, cannot be produced in this manner. The half-blue product is finished by sulphuration pretty much as explained above for the Nuremberg process. Well-made soda-ash ultramarine has a richer color than the Nuremberg variety.

(3) *Silica ultramarine* is soda-ash ultramarine in whose preparation a quantity of finely divided silica, equal to 5 to 10 per cent. of the weight of the kaolin, has been added. It is distinguished by a reddish tinge, which is the more fully developed the greater the proportion of added silica. It is more highly proof against the action of alum solution than non-siliceous ultramarine is.

Since 1873 the Nuremberg works have been producing four varieties of magnificently violet ultramarine. The mode of manufacture has not transpired. At the Paris exhibition in 1867 a magnificent block of ultramarine exhibited by the Kaiserslautern works attracted attention. In its manufacture the roasting (bluing) process is said to have been continued for three weeks.

Artificial, like natural, ultramarine has a magnificently blue color, which is not affected by light nor by contact with oil or lime as used in painting. Hydrochloric acid at once bleaches it with liberation of sulphuretted hydrogen gas and milk of sulphur. The natural pigment is proof against dilute acetic acid and solution of alum; the artificial pigment is even alum-proof only in a higher or lower relative sense. Hence there is room for progress in one direction at least. The composition of the pigment is quite similar to that of lapis lazuli; but the constitution of both is still a chemical enigma. It is remarkable that even a small addition of zinc-white (oxide of zinc) to the reddish varieties especially causes a considerable diminution in the intensity of the color, while dilution with artificial precipitated sulphate of lime ("annalin") or sulphate of baryta ("blanc fix") acts pretty much as one would expect. Ultramarine being very cheap (it sells at 7d. [14 cts.] to 10d. [20 cts.] per lb), it is largely used for wall painting, the printing of paper hangings and calico, etc., and also as a corrective for the yellowish tinge often present in things meant to be white, such as linen, paper, etc. Large quantities are used in the manufacture of paper, and especially for producing that kind of pale blue writing paper which is so popular in Great Britain. Only the very finest ultramarine can be used for paper tinging, because the least admixture of coarse particles becomes visible in the paper as dark spots or stains.

ULUGH BEG, MIRZA MOHAMMED BEN SHAH ROK (1394–1449), astronomer, grandson of TIMUR (*q.v.*), succeeded his father as prince of Samarkand in 1447, after having for years taken part in the government, and was murdered in 1449 by his eldest son. He occupied himself with astronomical pursuits, and erected an observatory at Samarkand, from which were issued tables of the sun, moon, and planets, with an interesting introduction, which throws much light on the trigonometry and astronomical methods then in use (*Prolégomènes des Tables Astronomiques d' Oulong Beg*, ed. by Sédillot, Paris, 1847, and translated by the same, 1853). The serious errors which he found in the Arabian star catalogues (which were simply copied from Ptolemy, adding the effect of precession to the longitudes) induced him to redetermine the positions of 992 fixed stars, to which he added 27 stars from Al Sûfi's catalogue, which were too far south to be observed at Samarkand. This catalogue, the first original one since Ptolemy, was edited by Th. Hyde at Oxford in 1665 (*Tabulæ Longitudinis et Latitudinis Stellarum Fixarum ex Observatione Ulugbeighi*), and in 1843 by Baily in vol. xiii. of the *Memoirs* of the Royal Astronomical Society.

ULVERSTON, a market-town in the northwest of Lancashire, England, is picturesquely situated near Morecambe Bay, on the borders of the Lake district, 9 miles northeast of Barrow-in-Furness, and 256 northwest of London. The town bears small evidence of its great antiquity. The principal streets branch from the market-place, and the houses built of stone are generally rough-cast and whitened. A rivulet flows through the town. The church of St. Mary, founded in 1111, retains the south door of the original building in the Transition style, but the greater portion of the structure is perpendicular, of the time of Henry VIII. It consists of chancel, nave, aisles, south porch, and embattled western tower, and contains an altar-tomb with recumbent figure of Walter Sandys of Conishead, dated 1588. After the destruction of Furness Abbey, Ulverston succeeded Dalton as the most important town in Furness, but the rapid rise of Barrow within recent years has relegated it to quite a secondary place. Formerly it had a considerable trade in linens, checks, and ginghams, but this has greatly fallen off. It pos-

sesses, however, large iron and steel works (North Lonsdale Iron and Steel Company), a large chemical work, an extensive paper manufactory, a bolt manufactory, breweries, tanyards, and wooden hoop manufactories. The population of the urban sanitary district (area 3120 acres) in 1871 was 7607, and in 1881 it was 10,008.

Early in the 12th century the lordship of Ulverston came into the possession of Stepheu, earl of Boulogue, afterwards king of England, by whom it was preseuted to the monks of Furness Abbey as part of the eudowment. In 1196 the *ville* of Ulverston was granted by the abbot of Furness to William de Lancaster, first baron of Kendal. In 1280 it obtained the charter of a market. The town became escheated to the abbot of Furness as chief lord in 1342, but this escheatment was suspended by Edward II. in favor of John de Coupland, who captured David II. of Scotland at the battle of Durham. After his death it reverted to the abbey. It is now iu the possession of the family of Buccleuch.

ULWAR, an alternative form of ALWAR (*q.v.*).

ULYSSES. See ODYSSEUS.

UMAÑ, a district town of Russia, in the south of the government of Kieff, is now a small industrial and trading town, with 15,400 inhabitants, many of whom are Jews, who carry on an active trade in the export of corn, spirits, etc. It has a remarkable park (290 acres), planted in 1796 by the orders of Count Potocki, in connection with which a gardening school is maintained.

Umañ was founded towards the begiuning of the 17th century as a fort against the raids of the Tartars. The Cossacks of the Ukraine, who kept it, revolted against their Polish rulers about 1665, and had to sustain a fierce siege. In 1674 it was plundered and most of its inhabitants murdered by the Ukrainians and Turks, during the wars for the hetmanship. In 1712 its last iuhabitants were transferred by Peter I. to the left bank of the Dnieper. But by the end of the 18th century, when it again became the property of the Potockis, it was repeopled and became one of the busiest trading towns of little Russia. In 1768, when the Cossacks revolted auew against their Polish serf proprietors, they took Umañ and murdered most of its inhabitants.

UMBALLA, an alternative form of AMBÁLÁ (*q.v.*).

UMBER. See PIGMENTS.

UMBRELLA now means a portable protector from rain, while the name parasol is given to the generally smaller, lighter, and more fanciful article carried by ladies as a sun-shade. But primarily the umbrella (*ombrella*, Ital. dim. from Lat. *umbra*, shade) was a sun-shade alone,—its original home having been in hot brilliant climates. In Eastern countries from the earliest times the umbrella was one of the insignia of royalty and power. On the sculptured remains of ancient Nineveh and Egypt there are representations of kings and sometimes of lesser potentates going in procession with an umbrella carried over their heads; and throughout Asia the umbrella had, and still has, something of the same significance. The Mahratta princes of India had among their titles "lord of the umbrella." In 1855 the king of Burmah in addressing the governor general of India termed himself "the monarch who reigns over the great umbrella-wearing chiefs of the Eastern countries." The baldachins erected over ecclesiastical chairs, altars, and portals, and the canopies of thrones and pulpits, etc., are in their origin closely related to umbrellas, and have the same symbolic significance. In each of the basilican churches of Rome there still hangs a large umbrella.

Among the Greeks and Romans the umbrella (*σκιάς*, *σκιάδειον*, *umbraculum*, *umbella*) was used by ladies, while the carrying of it by men was regarded as a sign of effeminacy. Probably in these southern climes it never went out of use, and we find from allusions by Montaigne that in his day its employment as a sun-shade was quite common in Italy. The umbrella was not unknown in England in the 17th century, and was already used as a rain protector. Michael Drayton, writing about the beginning of the 17th century, says, speaking of doves:

> "And, like umbrellas, with their feathers
> Shield you in all sorts of weathers."

Although it was the practice to keep an umbrella in the coffee-houses early in the 18th century, its use cannot have been very familiar, for in 1752 Colonel Wolfe, writing from Paris, mentions the carrying of them there as a defence against both rain and sun, and wonders that they are not introduced into England. The traveller Jonas Hanway, who died in 1786, is credited with having been the first Englishman who habitually carried an umbrella. That practice he began thirty years before his death; at first he was singular, and his habit was derided, but he lived to see his example commonly followed.

The umbrella as at first used, based on its Eastern prototype, was a heavy ungainly article which did not hold well together, and no little ingenuity has been exercised to bring it into the elegant, compact, and strong form which is now quite common. The early umbrella had a long handle, with ribs of whalebone or cane, very rarely of metal, and stretchers of cane. The joiuting of the ribs and stretchers to the stick and to each other was very rough and imperfect. The covering material consisted of oiled silk or cotton, heavy in substance, and liable to stick together in the folds. Gingham soon came to be substituted for the oiled cloth, and in 1848 William Sangster patented the use of alpaca as an umbrella covering material. One of the most uotable inventions for combining lightness, strength, and elasticity in the ribs of umbrellas was the "Paragon" rib patented by Samuel Fox in 1852. It is formed of a thin strip of steel rolled iuto a U or trough section, a form which gives great strength for the weight of metal. The use of such ribs, combined with the notched rings and runners which give a separate hinge and joint to each rib and stretcher, and with the thin but tough covering materials now in use, has principally contributed to the strength, lightness, and elegance which ordiuary umbrellas now present. Umbrella silk is principally made at Lyons and Crefeld; but much of it is so loaded in dyeing that it cuts readily at the folds. Textures of pure silk or of silk aud alpaca mixed have better wear-resisting properties.

UMBRIA (Ὀμβρική, Ὀμβρικοί, Οὐμβροι, UMBRI). The early Greeks applied the name Ὀμβρική to all central and northern Italy. Herodotus (iv. 49) speaks of it somewhat vaguely, as if it extended up to the Alps. The Umbrians probably extended across central Italy from sea to sea down as far as Latium. Pliny (iii. 13, 19) tells us that the Umbri were considered the most ancient nation of Italy (antiquissima gens Italiæ), by which he probably means, of the Italian stock. The Greek writers included under the name of Umbria the district known in later times as Picenum. Pseudo-Scylax makes Umbria march with Samnium, and describes Ancona as a city of Umbria. The Umbrians seem to have found the Siculi and Liburni in occupation of the land into which they advanced, the former holding the parts lying towards the interior, the latter people the district along the Adriatic. The Umbrians were one of the chief peoples of that branch of the Indo-European family which had entered Italy from the north and driven out and absorbed the older inhabitants. They were more closely connected with the Samnites and Oscans than with the Latin stock, as is shown by their language. Their possession of the fertile regions of upper Italy exposed them to the constant assaults of fresh bodies of invaders, pressing on over the Alps, and perhaps likewise from the seaboard. Their force was extended over a wide area, and thus too weak to withstand the attacks from various sides to which they were exposed. Thus their extensive territory was gradually reduced by the successive encroachments of other peoples. First came the Etruscans, who according to Herodotus (i. 94) were Lydians, who established themselves in the land of the Umbrians. From which side of Italy they made their invasion, whether from the mouth of the Po or from the western coast of what later became Etruria,

or whether from both, we have no means of determining. That the Umbrians did not yield without a struggle we cannot doubt. It was only after three hundred of their towns had been captured by the Etruscans that they succumbed. Nevertheless they still retained considerable influence in upper Italy, which, according to Strabo (v. 216), continued down to the time of the Roman conquest. For he says that there was a large Umbrian element in the Roman colonies in the region of the Po, as also some Etruscan. For, according to him, the Umbrians and Etruscans lived in a continual rivalry for the pre-eminence, so that if the one people made an expedition northwards, the other determined not to be outdone. So when the Etruscans had marched against the barbarians who dwelt near the Po, and had soon again been expelled owing to their effeminacy, the Umbrians in turn marched against the conquerors of the Etruscans. In consequence of this alternating struggle for these regions they planted many colonies, some Etruscan, others Umbrian. Most of the colonies were Umbrian because the Umbrians lay closer to the disputed territory. Thus, even though they lost the sovereignty, the Umbrian race probably continued to form a considerable portion of the population of a wide extent of country. At all events, at the time of the Gaulish inroad the Etruscans seem to be in possession of the mouth of the Po. At this time, therefore, Umbria as a state consisted of the region bounded on the W. by the Tiber, on the S. by the Sabines, on the E. by Picenum and the Adriatic, while on the N. it extended close up to the southern or Spinetic mouth of the Po. Scylax describes the Etruscans as extending from the Tyrrhenian Sea to the Adriatic, and represents them as in possession of the ancient Greek town of Spina. How much farther south the Etruscan sway had once reached we cannot determine, but that they had once held this region, as far as Ravenna at least, is rendered probable by the tradition that Ravenna had been founded by a colony of Thessalians who, not brooking the insulting treatment which they received from the Etruscans, gladly admitted some Umbrians, who thus became the possessors of the city. When the great Gaulish inroad took place at the beginning of the 4th century B.C. Etruscans and Umbrians alike suffered severely. Some of the Celtic tribes crossed the Po and formed permanent settlements. The Ananes settled in the Apennines, the Boii between the former and the Adriatic; next came the Lingones; and finally the Senones occupied the seaboard of the Adriatic as far as the Rubicon. This region in Roman times was known as the Ager Gallicus (Polybius, ii. 16). But it was not only in the north and west that the Umbrians had been driven back. The early Greeks had included under the name of Umbria the district along the Adriatic, afterwards known as Picenum. This consisted of a fertile region, extending from beyond Ancona to the river Matrino. It is not improbable that the Picentes issued from the Sabine region. Tradition alleged that the Picentes, led by the woodpecker (*picus*) of Mars, marched forth to occupy what is now the March of Ancona. But it was probably only after a long struggle that this conquest was effected, for from another tradition we learn that the Sabines, after carrying on war against the Umbrians for a long time, at length vowed a sacred spring, and dedicated all the produce of the year to the gods. Then at length they became victorious (Strabo, v. 250). Thus, by the advance of the Gauls from the north and the Picentes from the south, the Umbrians were shut off from the seaboard, and confined to the district known as Umbria in historical times. When Rome began the consolidating of Italy, Umbria consisted of the region bounded by the Ager Gallicus on the N., by Etruria (the Tiber) on the W., by Picenum on the E., and by the Sabines on the S. The Umbrians kept a desperate hold of this district, which lies between the two arms of the Apennines. This position indicates of itself that they had been driven before stronger foes. Henceforward they play but an insignificant part in Italian history. This is explained by the physical formation of their country. It is an extremely mountainous region, with a few small plains between, which were noted for their fertility. Hence arose a number of small but thriving communities, none of which had the capacity of developing into a leading state such as Rome became for the Latins. Their want of seaports likewise excluded them from trade, the mouths of all the rivers which flowed from their country being in the hands of their enemies.

Of the Umbrians' political and municipal organization little is known. In addition to the city (*tota*) they seem to have had a larger territorial division in the *tribus* (trifu, acc.) as we gather from Livy (xxxi. 2, per Umbriam quam tribum Sapiniam vocant; *cf.* xxxiii. 37) and from the Eugubine Tables (trifor Tarsinates, vi. B. 54). From the fertility of their land their communities were very prosperous. The olive and vine flourished in their valleys; they grew spelt abundantly; and the boars of Umbria were famous. Ancient authors describe the Umbrians as leading effeminate lives, and as closely resembling their Etruscan enemies in their habits (Theopompus, fragm. 142; Pseudo-Scymnus, 366–8). It is almost certain that each race influenced and modified the other to a large extent. Mommsen has pointed out that the names of many towns in Etruria are Umbrian, a fact which shows how persistent even after conquest was their influence in that region. On the other hand we have conclusive proof of strong Etruscan influences in Umbria. For instance, they undoubtedly borrowed their alphabet and the art of writing from the Etruscans. Their writing runs from right to left. The alphabet consists of nineteen letters. It has no separate symbols for O, G, Q; the aspirates ϕ and χ are wanting; on the other hand, it possesses forms for Z and V, and has likewise the Etruscan *f* (8). It also has a symbol ⊿ peculiar to itself for expressing the sound of palatal *k* when followed by either *e* or *i*. It is also very probable that they borrowed the art of coining money from Etruria. Two towns are known to have issued coins, which consist entirely of bronze, and belong almost entirely to the series of *æs grave*. The most important is that of Tuder (Todi), which must have been a place of some note. It was a strong fortress on the left bank of the Tiber on the confines of Etruria. Iguvium (Gubbio), which struck coins after the standard of Tuder, was a strong place likewise on the western or Etruscan side of the Apennines. The fact that it is only in towns on the side next Etruria that a coinage is found indicates that it was from the Etruscans they borrowed the art. The Umbrians counted their day from noon to noon. But whether they borrowed this likewise from the Etruscans we do not know (Pliny, ii. 77). In their measuring of land they employed the *vorsus*, a measure common to them and the Oscans (Frontinus, *De Limit.*, p. 30), 3½ of which went to the Roman *jugerum*. When the Romans undertook the conquest of Italy, the most feeble resistance of all was offered to them by the Umbrians. In the great struggle between the Samnite confederacy and Rome Umbria played an insignificant part. It is probable that all through the Second Samnite War their sympathies were altogether on the side of their Samnite kinsmen, and that some assistance was afforded by individual communities. It is not unlikely therefore that it was with a view to keep the Umbrians in check that the Romans planted a colony at Nequinum on the Nar, whose inhabitants were known as Nartes Interamnates, and who are included with the Etruscans, Iapydes, and Tadinates in the list of persons who were forbidden to be present at the sacred rites of Iguvium. At length in 308 B.C. the Umbrians made a vigorous effort to aid the Samnites, which, had it taken place earlier in the war, might have had the most important influence on the issue of the struggle. As it was, it came too late; the Etruscans had already laid down their arms. The Umbrians, who threatened to march on Rome, were intercepted by Rullianus with the Roman army from Samnium on the upper Tiber, a step which the Samnites now broken could not prevent; and this was sufficient to disperse the Umbrian levies. When the Third Samnite War broke out, the Umbrians took no active part in its operations; but how their sympathies lay is evident from their affording a ready passage to the Samnite army under Gellius Egnatius on its march to Etruria, 296 B.C. When the battle of Sentinum (295) finally crushed the Samnites and Etruscans, Umbria remained in the hands of the Romans. Henceforward the process of Latinizing went on steadily, for by the 1st cen-

tury B.C. we find them employing the Latin alphabet in copies of the ancient sacerdotal ritual of Iguvium (see EUGUBINE TABLES). We know that the Oscan language only finally expired in the 1st century of our era, and there is no reason for believing that the Umbrian had disappeared much earlier. When the Romans conquered the Senones, 280 B.C., the Ager Gallicus was restored to Umbria, and both together formed under the empire the sixth region of Italy.

Strabo (v. 227) regards Ravenna as the boundary of Umbria. The Via Flaminia passed up through it from Ocriculum to Ariminum, along which lay the important towns of Narnia (Narni) Carsulæ (Carsigliano), Mevania (Bevagna), Forum Flaminii, Nuceria, and Forum Sempronii. To the east lay Interamna (Terni), the probable birthplace of Tacitus, Spoletium (Spoleto), and the most important town of Camerinum on the side of the Apennines towards Picenum. On the side towards Etruria lay Tuder (Todi), Iguvium, which occupied a very advantageous position close to the main pass through the Apennines, Ameria (Amelia), and Hispellum (Spello); on the Clitumnus (Clitunno) was Assisium (Assisi), the birthplace of Propertius, whilst far to the north lay Sarsina, the birthplace of Plautus. For the position of the country in the time of Augustus, see vol. xiii. Plate V.

See Bréal, *Les Tables Eugubines*, 1875; Bücheler, *Umbrica*, 1883; Kirchhoff, *Griech. Alphabet*, 4th ed., 1887; Head, *Historia Numorum*, 1887. (W. RI.)

UMMERAPOORA, another form of AMARAPURA (*q.v.*).

UNAO, a British district in the Lucknow division of Oudh, India, under the jurisdiction of the lieutenant-governor of the North-Western Provinces. The area of the district is 1768 square miles, and it is bounded on the N. by Hardoi, E. by Lucknow, S. by Rai Bareli, and W. by the Ganges. Unao is very flat, and has no features of particular interest. Rich and fertile tracts, studded with groves, alternate with stretches of waste land and plains of barren *usar*, the whole being intersected with small streams, the water from which is extensively used for irrigation. The Ganges is the only navigable river in the district. The temperature varies from about 75° to 103° in the hot weather, and from 46° to 79° in the cold season. The average annual rainfall is about 34 inches.

In 1881 the population was 899,069 (males 461,167, females 437,902); of these 830,342 were Hindus, 68,677 Mohammedans, and 49 Christians. Unao, the capital and administrative headquarters, 9 miles northeast of Cawnpore, had 9509 inhabitants. The cultivated area of Unao amounted in 1885–86 to 598,131 acres, and 289,356 acres were returned as cultivable. The principal crops are rice, wheat, and other food grains, cotton, sugar-cane, and indigo. The cultivation is mainly dependent on irrigation. The principal exports are grain of all kinds, gúr, ghi, tobacco, and a little indigo and saltpetre; and the chief imports are piece goods, salt, iron, cotton, spices, etc. The gross revenue of the district in 1885–86 amounted to £183,083 [$889,783.38], the land yielding £144,914 [$704,282.04]. During the mutiny of 1857–58 Unaò was the scene of several severe engagements between General Havelock's little army and the rebels. On the death of Rájá Jasa Sinh, one of the leading rebels, and the capture of his two sons, the whole family estates were confiscated, and the villages either restored to their former owners or given to other landholders for their loyalty.

UNDULATORY THEORY. See OPTICS and WAVE THEORY.

UNGVÁR, chief town of the county Ung, in the northeast of Hungary, stands on the river Ung. It is the seat of the bishop of Munkács, and has a fine Greek cathedral, an episcopal seminary, a lyceum, a gymnasium, and also a teachers' college, a county hall, and an interesting ancient castle. The town and district produce good wine in large quantity, and abound in mineral springs. There is a good trade in timber and china clay. The population in 1886 was 13,460.

UNICORN, an animal with one horn. The name is applicable and has sometimes been applied to the rhinoceros, which is, for example, the Sumatran unicorn of Marco Polo. But the figure usually asssociated with the name is the well-known heraldic one of an animal with the form of a horse or ass, save that a long straight horn with spiral twistings, like the tusk of the narwhal, projects from its forehead. The belief in the existence of a one-horned animal of this kind goes back to Aristotle (*Part. An.*, iii. p. 663), who names as one-horned "the oryx and the Indian ass." Later descriptions of the Indian unicorn, *e.g.*, that of Ælian (*Nat. An.*, xvi. 20), are plainly influenced to some extent by accounts of the rhinoceros, but the authority of Aristotle determined the general form ascribed to the animal. The twisted horn, of which Ælian already speaks, seems to have been got by referring to Aristotle's unicorn actual specimens taken from the narwhal; see Yule's *Marco Polo*, ii. 273. The ancient and mediæval lore of the subject may be seen in Bochart, *Hierozoïcon*, iii. 26. The familiar legend that the unicorn could be taken only by the aid of a virgin obtained currency through the *Physiologus* (see vol. xix. p. 11). The English Bible, following the Septuagint (μονόκερως), renders the Hebrew *rĕēm* (ראם) by "unicorn." But two horns are ascribed to the *rĕēm* in Deut. xxxiii. 17, and the Hebrew word reappears in Arabic as the name of the larger antelopes, probably the *Antilope leucoryx*, while in Asyrian the *rīmu* appears to be the wild ox. There are recent fossil remains in the Lebanon both of *Bos Primigenius* and *Bison urus*, though both have been long extinct in Palestine.

UNITARIANISM. The term Unitarianism in its widest sense includes certain lines of the great religious and theological movement or revolution of the Reformation in the 16th century, when this is regarded as the commencement of the process of the humanization of theology and ethics on the basis of the autonomy of the human mind. In another sense the term stands for a set of theological opinions, more or less variable, and yet in their general drift connected, some of them as old as Christianity, and one section of which only is indicated by the term when used as synonymous with Antitrinitarianism. But there is another meaning of the term, a still narrower one, and to Unitarianism in this sense this article must be confined. We must limit ourselves to a brief account of Unitarianism as it appears in ecclesiastical organizations in separation from the orthodox churches. This treatment of the subject is of course incomplete, and would be misleading were the incompleteness not expressly announced. For a marked feature of the late history of the Unitarian churches is the growing tendency they exhibit of working out to their logical results some of the wider principles of the Reformation to which they ultimately owe their origin, rather than the design of formulating and propagating systems of theology. To not a few modern Unitarian leaders the bond which connects them with a specifically Unitarian organization is the spirit and tendency of the larger movement for which it happens to provide freer play than the orthodox churches, while they repudiate the imputation of belonging to a dogmatic sect. Modern Unitarians have also, both in Europe and America, emphatically and successfully resisted the inclination of some of their number to lay down, though in the most general terms, a creed of Unitarianism. Indeed, in opposing this inclination, it might sometimes seem as if the only essential article of Unitarianism were the maintenance of free inquiry in religion,—an impression, however, which a careful study of the history of Unitarian thought would remove. In the same way such a study would show that Unitarian churches are in agreement on many points of doctrine with early and recent theologians of all churches and sects.

This brief sketch of Unitarianism, as it has appeared in organized religious societies, takes us into but a few countries, and covers but a limited space of time. Poland, Transylvania, England, and America are the only countries in which Unitarian congregations have existed in any numbers or for any length of time. Elsewhere, either the law of the land has

rendered their existence impossible, or they have been unnecessary in consequence of the substantial adoption by the existing churches of their principles and doctrines. The former was the case in Italy, Switzerland, Germany, and England in the 16th and 17th centuries, the latter to a certain extent in England in the 18th century, still more in Germany in the 18th and 19th centuries, and in Holland in the present century, as also to a large extent in France in the Reformed Church.

Poland (1565–1658).—The Unitarians, under the names of Arians, Samosateuians, Pinczowians, were formed into a separate church in 1565 by their exclusion as Antitrinitarians from the synods of the Trinitariau Protestants. Very early in the progress of the Reformation in Poland individuals had arrived at heterodox opinions on baptism and the Trinity, very much under the influence of the heterodox Italiau refugees in Switzerland, some of whom visited Polaud (Lelio Sozzini, 1551 and 1558; Paul Alciati, 1561; G. V. Gentile, 1561; Biandrata, 1555). Gonesius and Gregory Pauli were the first to openly preach Antitrinitarian doctrine. After their separation from the orthodox, the Polish Unitarians developed divergent views as to the nature of Christ, as to the lawfulness of paying divine worship to Him, as to the subjects of baptism (infants or adults), aud as to the relatiou of Christians to the state. On the first point some were Arians and others Humanitarians, while those who claimed divine worship for Christ were called *Adorantes* and those of the opposite view *Nonadorantes*. An epoch in the history of the party was made by the arrival of Fausto Sozzini at Cracow in 1579 (see SOCINUS). He succeeded in converting the great majority of the churches to his views and in silencing the dissentieuts. Henceforth the Polish Unitarians adopted the Sociniau practice of paying worship to Christ, the Socinian view of the necessity of baptism and of the Christian's duty towards the state. They rapidly became a numerous and powerful body in Poland, distiuguished by the rank of their adherents, the ability and learning of their scholars, the excellence of their schools, and the superiority and wide circulation of their theological literature. Racow, the theological centre of the Socinians, with its school and printing presses, obtaiued a world-wide fame. It was there that the *Racovian Catechism* was published (1605 in the Polish language, 1608 in German, and 1609 in Latin). But before the death of Fausto Sozziui (1604) the situation of the Unitarians became more difficult, and in 1611 the Jesuits obtained their first open triumph over them. In the rapid course of the Catholic reaction, which was not resisted by the orthodox Protestants as long as the Socinian heretics only suffered, the church and school at Lublin, the most important place next to Racow, were first put down (1627), and Racow, with its church, school, and priuting-press suffered the same fate in 1638. The final blow to the whole body followed in 1658, when all adherents of "the Arian and Anabaptist sect" were commanded to quit the kingdom within two years. A few renounced their faith, but the large majority fled into Transylvania, Prussia, Silesia, Holland, and England.

Transylvania (1568–1887).—Next to Poland Transylvania was the most important seat of Unitarianism. It was there the name was first used by the sect as its own designation, and it is there only that the sect has had a continuous existence down to our own time. It is generally considered that the Italian refugee Biandrata was the founder of Transylvanian Unitarianism, but the preseut representatives of the body claim for it a nobler and domestic origin. Biaudrata attended John Sigismund as a physician in 1563, and under his influence Unitariauism made rapid progress. In 1568 its professors, favored by the king and many magnates, after separating from the orthodox church, constituted themselves a distinct body under the distinguished man Francis David, who is now regarded as the apostle of true Transylvaniau Unitarianism. Their principal centre was Klausenburg (Kolozsvár), where they had a large church, a college, and a printing-press. But the same conflict between a more radical and a more conservative tendency which appeared amongst the Unitarians of Poland greatly disturbed the churches of Transylvania, particularly with regard to the worship of Christ. On the side of the *Adorantes* was Biandrata, and on that of the *Nonadorantes* David. The party of David succumbed to force and fraud, and he himself died in prison a martyr to his convictions. Gradually the Socinian view prevailed, though in 1618 an old order to worship Christ required reinforcement. In the latter half of the 18th century the more logical view of David entirely disappeared. Under the Austrian dynasty the Unitarians were often exposed to great trials, until Joseph II. secured to them their rights and privileges. An official confession of faith of the year 1787 remains, with some modifications, essentially Socinian. But of late years the Transylvauian Unitarians have been in close relation with their co-religionists iu England and America, some of the ministers having been educated at Manchester New College, and in consequence their theology is becoming essentially modern. The number of members was 32,000 in 1789, iu 1847 40,000, distributed in 104 parishes with 120 pastors. Their present number is 53,539 in 106 parishes. Their chief centres are Kolozsvár, Thorda, and Keresztur, where they have excellent schools.

England (1773–1887).—For two and a half centuries previous to the rise of organized Unitarianism in England, opinions commouly called by this name found numerous individual advocates and some martyrs. John Bidle (1615–62) published catechisms of Unitarian doctrine, translated Socinian works, and publicly discussed and preached an English form of Socinianism. But the severity of the law against Antitrinitarians, coupled with the gradual growth of free opinion in the Established Church and amongst the Presbyterian congregations, made the formation of separate Unitarian churches impossible, and, as was felt, less necessary for another hundred years. The adoption of a completely Humanitarian view of Christ's person by a few solitary individuals (Lardner 1730, Priestley 1767, Lindsey 1773), assisted by the awakened earnestness of the time, led to their formation. Lindsey resigned a valuable living in Yorkshire, and gathered the first professedly Unitarian church in London. Other clergymen followed his example, and amongst the Presbyterians several ministers, like Joseph Priestley, exchanged their Arian for Humanitarian views. This process went on with deep permanent effects in some of the Dissenting academies. In the year 1791 was formed the Unitarian Book Society for the distribution of literature, and several provincial associations originated about the same time. In 1806 the Unitarian Fund Society was established, with the object of promoting Unitarian Christianity by direct missiou work. In 1818 arose another society for protecting the civil rights of Unitarians. These various societies were consolidated in 1825 under the name of the British and Foreign Unitarian Association, which has now its headquarters in the building formerly used as Lindsey's chapel and residence in Essex Street, London. Early in this century nearly the whole of the old Presbyterian congregations, which, unlike those of the Baptists and Indepeudents, had undogmatic trust-deeds, passed through the stages of Arminianism and various forms of Arianism into Socinianism in its peculiar English and mainly Priestleian form. The peual laws against Antitrinitarianism, which had long been obsolete, were repealed in 1813, and in 1844 the right of Unitarians to the chapels which they held in succession from their Presbyterian forefathers was legally secured to them by the Dissenters' Chapels Act without altering their undogmatic trust-deeds. Though these congregations, popularly known as Unitarian, on principle declined to restrict the progress of thought by imposing ou either their ministers or members any dogmatic statements of belief, the generality of them adopted with some modifications the theological system of Priestley, which was a combination of Locke's philosophy with the crudest rationalistic supernaturalism. With the rise of a more spiritual philosophy in Germany, which bore fruit in England and America before the close of the second decade of the century, the theology of English Unitarianism underwent a radical change, very much in the first instance under the influence of Dr. Channing's writings. Without at all sacrificing its critical and rational bent, a deeper emotional and spiritual element was introduced into it, which gradually, at the cost of some years of internal conflict, dispossessed the purely external and supernaturalistic Socinian and Priestleian legacy. English Unitarian theology was thereby brought into close sympathy with modern scientific theology in Germany and elsewhere. This great and saving transformation was mainly due directly to James Martineau, J. J. Tayler, and J. H. Thom, aided by the writings of Channing and then of Theodore Parker. One consequence of the greater substantial agreement of the present theology of the larger number of the Unitarian churches with the scientific theology of the century is that not a few representatives of these churches disclaim the name Unitarian as one tending to perpetuate divisions which have really no right to continued existence. The main reason for continued separation from the larger liberal churches, whether Established or Dissenting, earnestly urged by many Unitarians of this class, is the use in those churches of theological formularies which modern theology regards as of historic interest only. The number of congregations in England and Wales geuerally described as Unitarian is about 300, nearly half of which date from between 1662 and 1750, and nearly all of which have undog-

matic trust-deeds. Their constitution is purely congregational. For the education of their ministers they have Manchester New College, London (strictly undenominational), the Unitarian Home Missionary Board, Manchester, and Carmarthen College, supported and managed by the Presbyterian Board in London, but practically Independent and Unitarian. The organs of the body are *The Inquirer*, *The Christian Life*, *The Unitarian Herald* (weeklies), and *The Christian Reformer* (monthly). In Scotland there are 7 Unitarian congregations and 2 Universalist, the latter being, as in America, Unitarian in doctrine. In Ireland the number is about 40, being nearly all Presbyterian in constitution. They are much stronger in the north than in the south of Ireland. In the north Antitrinitarian views began to spread about 1750; but the first congregation at Dublin traces its Unitarianism back to Thomas Emlyn, who was imprisoned for his Arian opinions in 1702 at the instigation of orthodox Disseuters.

United States (1815–1887).—In the United States Unitarianism had no organized existence previous to 1815, and as in England at the present time the name has always covered great differences of opinion within a common outline of belief or common drift of religious thought. Historical American Unitarianism represents "the liberal wing of the Congregational body." Of the existing 370 churches 120 or more were originally the parish churches founded by the Puritan Congregationalists, which, like the Presbyterian congregations in England, passed gradually from Calvinism through Arminianism to Unitarianism, of which Harvard College became the spiritual centre. In 1812 there was but one church in America professedly Unitarian (that of King's Chapel, Boston), though the ministers of Boston generally held Unitarian views. In 1815 Belsham's account of the "State of the Unitarian Churches in America" (in his *Life of Lindsey*, London, 1812) led to a controversy, the issue of which was the distinct avowal of Unitarian principles on the part of the liberal clergy of New England. Dr. W. E. Channing came forward as the prophet and champion of American Unitarianism, though the older he grew the more emphatically he repudiated sectarianism in every form. The Congregational body was thereby split into two sections, one of which styled themselves Unitarian Congregationalists. In 1825 the American Unitarian Association was formed, mainly for the diffusion of Unitarian literature and the support of poor congregations. At that time the Unitarian churches numbered about 122. Twenty years later they were some 280, while now they are about 383. The theological colleges of the body are the Divinity School of Harvard University, which is, like Manchester New College, undenominational, and the Theological School of Meadville. As in England so in America the theology of Unitarians has passed through marked changes, which have been attended by conflicts more or less acute. From 1815 to about 1836 a Biblical, semi-rationalistic semi-supernaturalistic theology prevailed, in the heart of which Channing's elevated ethical ideas were fermenting and slowly preparing a new birth. From 1836 forces such as Biblical criticism, Carlyle and Emerson's "transcendentalism," and Theodore Parker's "absolute religion" opened the era of modern theology, bringing American Unitarianism into living touch with the philosophy and theology of Germany. An effort in 1865 to bring the right and left wings of the body into a closer confederation with a more pronounced profession of Christianity led to the formation of a Free Religious Association on the broad basis of the love of truth and goodness. In the Western States the same controversy of fellowship has been raging for more than ten years. In May, 1886, a resolution was passed by the Western Unitarian Conference by a majority of more than three-fourths adopting a purely ethical and non-theological basis of fellowship. This led to a split in the body, and the formation of a new Western Association on a distinctly Christian platform. The left wing of American Unitarians show greater sympathy with recent scientific speculation and less fear of pantheistic theories than is the case with English Unitarians. The organs of the body are *The Unitarian Review* (Boston), *The Christian Register* (Boston), and *The Unitarian* (Chicago).[1]

[1] [Early in the 18th century Unitarian tendencies appeared in some of the churches established by the Puritans in New England, and the elder president Adams, himself a Unitarian, affirmed that his views were shared by many of the clergy and intelligent laity. In 1783, under the lead of Rev. James Freeman,* the Episcopal Church of King's Chapel, Boston, expurged from the Book of Common Prayer all allusions to the Trinity or to the worship of any being save the Father, and thus became the first distinctively Unitarian Church in America, though many of the Congregational Churches were silently dropping the Trinitarian forms. In 1796 a Unitarian society was organized in Philadelphia, where the famous Dr. Priestley had given a course of lectures on "The Corruptions of Christianity." In 1801 the church at Plymouth, Mass.,—the oldest religious society in New England, organized by the Pilgrims of the Mayflower, in 1620,—declared itself Unitarian by a large majority, finding no need of any change in the terms of its original covenant. During the two decades following, the liberal tendencies within the Congregational churches rapidly ripened. The American Unitarian Association has its headquarters in Boston, where it has erected a handsome building for its own uses and those of the denomination. The Association is the adopted instrument of the "National Conference of Unitarian and Other Christian Churches," a biennial organization with advisory functions, composed of delegates from the churches, organized in April, 1865, chiefly under the lead of Rev. Dr. Bellows, whose successful presidency of the U. S. Sanitary Commission had brought him to great prominence and influence. All the Unitarian congregations are held together by the religious spirit rather than by any verbal formula or ecclesiastical prescription. Like their individual members, each is strictly independent, and the denomination maintains periodicals, as mentioned in the text, but has no "organs."—C. G. A.]

* [Of Boston (1759–1835), a Harvard graduate, lay-reader, ordained by his vestry, first American clergyman to call himself Unitarian, had a controversy with Dr. Southey, founded Massachusetts Historical Society.—Am. Ed.]

Literature.—On Unitarianism in general, see Fock, *Der Socinianismus*, Kiel, 1847; Wallace, *Antitrinitarian Biography*, London, 1850; *Unitarianism exhibited in its Actual Condition*, edited by J. R. Beard, London, 1846. On Socinianism and Unitarianism in Poland and Transylvania: the above works; the historical sketch of Thomas Rees in his translation of the *Racovian Catechism*, London, 1818; J. J. Tayler in *Theological Review*, Jan., 1869; *Report of an Official Visit to Transylvania*, by Alexander Gordon, London, 1879. On Unitarianism in England: Wallace's and Beard's works; J. J. Tayler, *A Retrospect of the Religious Life of England*, London, 1845, 3d ed., 1876; James Martineau, *The Three Stages of Unitarian Theology*, London, 1869; Bonet-Maury, *Early Sources of English Unitarian Christianity*, English trans., London, 1884; *Unitarian Christianity, Ten Lectures on the Positive Aspects of Unitarian Thought and Doctrine*, with preface by Rev. J. Martineau, D.D., London, 1881. On Unitarianism in America: Fock; Beard; J. H. Allen, *Our Liberal Movement in Theology*, 2d ed., Boston, 1883; *The Year-book of the Unitarian Congregational Churches for* 1888, Boston, 1887; Count Goblet d'Alviella, *The Contemporary Evolution of Religious Thought in England, America, and India*, English trans., 1885. UNITAS FRATRUM. See Moravian Brethren.

UNITED BRETHREN IN CHRIST,[2] a body of Protestant Christians in the United States of America, which in 1886 included 4332 organized churches (4078 in 1877), 185,103 members (143,881 in 1877), 1378 itinerant ministers, 890 local preachers, 3169 Sunday schools, with 28,547 teachers and 179,729 scholars. The total value of church property held by the denomination was $3,345,064; the sum raised for salaries, church building expenses, colleges, missions, and the like made a total of $842,700. The organization of the church is Episcopal (six bishops, two of them missionary), but its polity combines features of the Methodist, Congregational, and Presbyterian systems. The creed may be described as Arminian. The members are prohibited from joining secret societies, and from using alcohol or engaging in its manufacture or sale. In connection with the denomination are a theological institution (39 students), ten colleges, and nine academies or seminaries of a higher grade, with 62 professors, 64 other teachers, and 2486 students. There are 49 annual conferences, 46 of them in the United States. Two missions in the Sherbro country in West Africa have 6 American missionaries, 9 churches, and 2631 members; in Germany there are 10 German missionaries, with 20 churches and 615 members.

The denomination originated in the labors of P. W. Otterbein (1726–1813), a native of Germany, who came as a missionary to Lancaster, Pa., in 1752, and settled at Baltimore in 1774. He became associated with Martin Boehm, a Mennonite preacher, and also co-operated with the Methodist preachers when they came to Pennsylvania. The first annual conference was held in 1800.

UNITED KINGDOM, The, of Great Britain and Ireland is the official title, adopted in 1801, now applied to England, Scotland, and Ireland (see Great Britain). The total area is returned as 77,657,065 acres, or 121,339 square miles,—England and Wales embracing 37,370,041 acres (whereof Wales 4,721,633), Scotland 19,467,077, and Ireland 20,819,947. The accompanying table gives the population of the counties according to the census of 1881, and their parliamentary representation as determined by the Redistribution Act of 1885. In the enumeration of the Scottish members of parliament, groups of burghs are included in the counties containing the burghs whence

[2] [Further information concerning this society is given in vol. xxix.—Am. Ed.]

they are respectively named, while it is to be observed that Kinross county is united with Clackmannan, Nairn with Elgin, and Selkirk with Peebles. The

addition of the nine university representatives (England, 5; Scotland, 2; Ireland, 2) brings the total membership of the House of Commons to 670.

For the Islands in the British Seas the figures are as follows: Isle of Man—141,263 acres, population 53,558; Channel Islands—48,322 acres, population 87,702.

UNITED PRESBYTERIAN CHURCH, THE, in point of numbers the third of the Presbyterian organizations of Scotland, was formed in 1847 by the union of the United Secession and Relief Churches (see below). The doctrinal standards are those of the other Presbyterian churches of Scotland, and the formula employed at the ordination of ministers is similar to that of the Established and Free Churches; but adherence to the doctrinal standards is professed in view of the Declaratory Act of 1879, according to which signatories "are not required to approve of anything in the standards of the church, which teaches or is supposed to teach compulsory or persecuting and intolerant principles in religion," and are allowed freedom of opinion on all points which, in the judgment of the church, do not enter into the substance of the faith. The denomination in 1887 consisted of 32 presbyteries and 564 congregations (518 in 1847), with a total membership of 182,063 (175,066 in 1878; 178,195 in 1883), thus representing about 14 per cent. of the population of Scotland. The number of baptisms in 1886 was 9894; there were 887 Sunday schools, with 11,994 teachers and 97,535 scholars, besides 788 advanced Bible classes, with 30,535 scholars. The total income of the church in 1886 was £373,545 [$1,815,428.70] (average for ten years from 1877 to 1886, £375,660 [$1,825,707.60]); of this total £237,300 [$1,153,278] was ordinary congregational income, and £136,245 [$662,150.70] missionary and benevolent income. The average stipend paid to each minister was £259, 16s. 10d. [$1262.83]. There is a divinity hall in Edinburgh with 4 professors and (session 1887–88) 114 students. The term of study is three years. The United Presbyterian Church has missions in Jamaica (a synod with four presbyteries), Trinidad, Kaffraria, Old Calabar, India, China, Japan, and Spain. The mission staff consists of 60 ordained Europeans, 22 ordained natives, 8 medical missionaries, 3 European evangelists, and 19 female missionaries. Under these are 502 native evangelists, teachers, and other helpers. In 1886 the membership of the native congregations was 13,214 (10,215 in 1881). In Jamaica there is a theological institution. At the end of 1875 the denomination had 620 congregations, with 190,242 members, but in June, 1876, 98 of its congregations in England, with 20,207 members, were incorporated with the English Presbyterian Church.

HISTORY.—(1) *United Secession Church.*—The general causes which led to the first great secession from the Church of Scotland as by law established in 1688 have already been briefly indicated under PRESBYTERIANISM (see vol. xix. p. 705; compare also SCOTLAND, CHURCH OF, vol. xxi. p. 564 *sq.*). Its immediate occasion rose out of an Act of Assembly of 1732 which abolished the last remnant of popular election by enacting that, in cases where patrons might neglect or decline to exercise their right of presentation, the minister was to be chosen, not by the congregation, but only by the elders and Protestant heritors. The Act itself had been passed by the Assembly, although the presbyteries to which it had been previously submitted as an overture had disapproved of it by a large majority; and in accordance with a previous Act (1730), which had taken away even the right of complaint, the protests of the dissentient majority were refused. In the following October Ebenezer ERSKINE (*q.v.*), minister of Stirling, who happened to be moderator of the synod of Perth and Stirling, preached a synod sermon, in the course of which he took occasion to refer to the Act in question as in his opinion unscriptural and unconstitutional.[1] Some of his expressions were objected to by members of synod because "tending to disquiet the peace of the church and impugning several Acts of Assembly and proceedings of church judicatories," and after long and keen debate it was resolved that he should be censured for them. This judgment, on appeal, was affirmed by the Assembly in May, 1733, whereupon Erskine protested to the effect that he held himself still at liberty to teach the same truths and to testify against the same or similar evils on every proper occasion. This protest, in which he was joined by William Wilson, Alexander Moncrieff, and James Fisher, ministers at Perth, Abernethy, and Kinclaven

[1] The passing of the Act was certainly unconstitutional; it was rescinded in 1734, "because not made according to former Acts."

respectively, was regarded by the Assembly as contumacious, and the commission of Assembly was ordered to procure its retractation or to proceed to higher censures. In November accordingly the protesting ministers were severed from their charges, their churches declared vacant, and all ministers of the church prohibited from employing them in any ministerial function. They replied by protesting that they still adhered to the principles of the church, though now obliged to "make a secession from the prevailing party in ecclesiastical courts," maintaining their continued right to discharge all the duties of the ministerial and pastoral office "according to the word of God, the Confession of Faith, and the constitution of the church," and appealing to the "first free, faithful, and reforming General Assembly of the Church of Scotland." In December, 1733, they formally constituted themselves into a presbytery, but for some time their meetings were devoted almost entirely to prayer and religious conference. In 1734 they published their first "testimony," with a statement of the grounds of their secession, which made prominent reference to the doctrinal laxity of previous General Assemblies. In 1736 they proceeded to exercise "judicial powers" as a church court, published a "judicial testimony," and began to organize churches in various parts of the country. Having been joined by four other ministers, including the well-known Ralph Erskine, they appointed Mr. Wilson professor of divinity. For these acts proceedings were again instituted against them in the Assembly, with the result that, having disowned the authority of that body in an "act of declinature," they were in 1740 all deposed and ordered to be ejected from their churches. Meanwhile the members of the "Associate Presbytery" and its adherents steadily increased, until in 1745 there were forty-five congregations under its jurisdiction, and it was reconstituted into an "Associate Synod." A violent controversy arose the same year respecting the religious clause of the oath taken by burgesses in Edinburgh, Glasgow, and Perth ("I profess and allow with my heart the true religion presently professed within this realm and authorized by the laws thereof"), and resulted in April, 1747, in a "breach," when two bodies were formed, each claiming to be the "Associate Synod;" those who condemned the swearing of the burgess oath as sinful came to be popularly known as "Antiburghers," while the other party, who contended that abstinence from it should not be made a term of communion, were designated "Burghers." The Antiburghers not only refused to hold further friendly conference with the others, but ultimately went so far as to pass sentences of deposition and the greater excommunication on the Erskines and other ministers who held the opposing view.

The Associate (Antiburgher) Synod held its first meeting in Edinburgh in the house of Adam GIB (*q.v.*) on April 10, 1747. It grew with considerable rapidity, and in 1788 had ninety-four settled charges in Great Britain and nineteen in Ireland, besides a presbytery in America. For purposes of organization it was formed in that year into four provincial synods, and took the name of "The General Associate Synod." The "new light" controversies as to the province of the civil magistrate in matters of religion led to the publication of a revised testimony in the "voluntary" sense in 1804, and in consequence M'Crie, the historian of Knox, with three other brethren, withdrew to form the Constitutional Associate Presbytery.

The Associate (Burgher) Synod held its first meeting at Sterling on June 16, 1747. The number of congregations under its charge rapidly increased, and within thirty years there were presbyteries in connection with it in Ireland and North America, as well as throughout Scotland. In 1782 the American presbyteries took the designation of the Associate Reformed Church in America. About the year 1795 the "voluntary" controversy respecting the power of the civil magistrate in matters of religion arose within this synod also, and a large majority was found to have adopted "new light" views. This led in 1799 to the secession of the "Associate Presbytery," which in 1805 took the designation of the Associate Synod or Original Burgher Synod.[1]

In 1820 the General Associate or Antiburgher Synod (to the number of 129 congregations[2]) united with the 154 congregations of the Associate or Burgher Synod. The body thus constituted, "The United Secession Church," had increased by 1847 to 400 congregations, the whole of which united in that year with the Relief Synod to form the United Presbyterian Church.

(2) *Relief Church.*—The Presbytery of Relief was constituted in 1761 by three ministers of the Church of Scotland, one of whom was Thomas GILLESPIE (*q.v.*), who had been deposed by the Assembly in 1752 for refusing to take part in the intrusion of unacceptable ministers. The number of congregations under its charge increased with considerable rapidity, and a Relief Synod was formed in 1773, which in 1847 had under its jurisdiction 136 congregations; of these 118 united with the United Secession Church in that year. The Relief Church issued no distinctive "testimonies," and a certain breadth of view was shown in the formal declaration of their terms of communion, first made in 1773, which allowed occasional communion with those of the Episcopal and Independent persuasion who are "visible saints." A Relief theological hall was instituted in 1824.

See M'Kerrow, *History of the United Secession Church*, 1841; Struthers, *History of the Relief Church*, 1843; Mackelvie, *Annals and Statistics of the United Presbyterian Church*, 1873.

UNITED PROVINCES. See HOLLAND.

[1] The majority of this synod joined the Church of Scotland in 1839. The small minority which still retained the name joined the Original Seceders (see next note) in 1842, the resultant body assuming the designation of United Original Seceders. A small majority (twenty-seven ministers in all) of the Synod of United Original Seceders joined the Free Church in 1852. A synod of this name still exists, having under its jurisdiction four presbyteries, with twenty-nine charges (of which two are in Ireland).

[2] A dissentient remnant (eight congregations) of the General Associate Synod united with the Constitutional Associate Presbytery in 1827, the resultant body being called the Associate Synod of Original Seceders.

UNITED STATES.

HISTORY.

Copyright, 1904, by The Werner Company.

I. Discovery and Colonization.

THE latest investigations make it quite probable that the American continent was visited many centuries ago by Arabs, by Chinese and by Irishmen; but the proof of such visits is at present so vague and shadowy that they cannot be accepted as fully established. There is no question, however, that some of the daring navigators of Norway, Sweden and Denmark, known as Northmen or Norsemen, crossed the stormy Atlantic and founded a colony in America, near the opening of the eleventh century. Previous to this date, they planted settlements in Iceland, and in lower Greenland, ruins of which remain to this day. The founder of the colony was Eric the Red, and it was his son, Leif Ericson, who, in the year 1000, sailed from Greenland with a single ship and a crew of thirty-five men. Sighting the continent, they coasted southward, landing at several points. The abundance of wild grapes tempted them to go ashore and begin a settlement known as Vinland. They were followed by other colonists from Greenland, and the prospects of permanence were good, but the settlers quarreled among themselves, there was trouble with the Indians (due as always to the injustice of the white men), and the colonies after a time were abandoned.

Earliest discoverers of America.

The Northmen.

It seems strange that these discoveries by the Northmen attracted no attention in Europe, but the people in those far-away times were ignorant and wholly taken up with their own affairs. The chief occupation of men during the Dark Ages was warring with one another, and causing humanity to suffer. Science, art, literature, discovery, invention and all that tends to elevate mankind seemed to have lost their attraction. No interest was felt in remote countries and peoples, and, as has been said, America presented the anomaly of a vast country that was found and then lost for several hundred years.

But the visits of the Northmen to Iceland could not pass wholly from the knowledge of men. The stories of those shaggy rovers who laughed in the face of the tempest, passed from father to son through many generations, and, finally, when Leif Ericson had mouldered for three hundred years in the grave, the story of what he and his countrymen did was put in writing. It is inevitable that some of the details contain errors, but the leading statements are true beyond all possibility of doubt.

Leif Ericson.

Naturally a trade had been carried on almost from time immemorial between Europe and Asia. The latter, the mightiest of all the continents, sent its pearls, spices, gums, jewels, ivory, silks and other precious productions westward, and received in exchange metals, woods and more homely commodities. It was the barter of the useful for the ornamental, —the necessity for the luxury. From Asia to Europe, the route was by land from the Red Sea and the Persian Gulf to the Mediterranean, or by the Black and Caspian seas to the eastern extremity of the same body of water. A procession of ships was continually passing eastward and another westward laden with valuable freight, and the merchants of Venice, Genoa, Pisa, Alexandria and other Mediterranean ports prospered, and many cities became rich and powerful.

Trade between Europe and Asia.

But the "unspeakable Turk" steadily pushed his conquests, and finally in 1453, conquered the Eastern Empire and captured Constantinople. At the same time, the Barbary states of northern Africa disgorged thousands of pirates into the western Mediterranean. The ships of the Christian nations were the special prey of these ferocious barbarians, and the great inland sea was closed against all peaceful commerce. A new route was indispensable. What should it be?

Need of a new route.

For a goodly number of years the belief had been steadily growing among intelligent men that Asia could be reached by sailing around the southern point of Africa. Repeated attempts were made by the Portuguese, who at that time were the leading navigators, but the most valiant captains seemed to be seized with a panic, after groping southward for a few hundred miles, and hurried home again. Still they kept edging forward, and, when it became evident that the voyage must be a very long and dangerous one, navigators began to ask one another whether there was not a shorter route to the distant country.

Among these inquirers was a native of Genoa, Christopher Columbus, who was a good sailor, but whose profession was that of making maps. He found employment in Lisbon, where the conviction grew upon him that a ship by sailing west from Europe would in time reach China. Columbus talked with many old navigators who told him of finding wreckage and drifting trees and plants far out to sea, whose appearance showed that they had floated thither from some unknown region. It is quite likely, too, that Columbus heard of the achievements of the Northmen nearly five hundred years before. Be that as it may, nothing could shake his belief that a westward voyage would in the end carry a ship to the East Indies.

Christopher Columbus.

It is a pathetic picture of Columbus spending seven or eight years in visiting the different courts of Europe, and pleading with the rulers to provide him with the means of making the great voyage that was to bring such glory and gain to the sovereign who thus seized the prize. But the Italian, who had reached middle life, was looked upon as a dreamer and his schemes were treated with ridicule. Finally, however, King Ferdinand and Queen Isabella of Spain were impressed, and advanced the Italian enthusiast the necessary funds. On August 3, 1492, he sailed with three small ships or caravels and a crew of ninety men from the port of Palos, Spain.

Sailing of the great expedition.

For more than two months the little vessels pressed westward, nearly all of the sailors scared almost out of their senses, for they believed that by and by they would sail off the edge of the world or become the prey of horrible monsters that inhabited the unknown ocean toward which they were making their way. The crew were on the verge of mutiny more than once, and it required great tact, promises and threats on the part of Columbus to hold them to their work. He succeeded, and on the night of the 11th of October, a flickering light was discerned through the darkness, which he knew must come from land. At the earliest dawn, all were thrilled by the sight of a small island. It was one of the group known as the Bahamas, generally supposed to be Watling, though there is no certainty. Not doubting that it belonged to the East Indies, Columbus called the natives *Indians*, by which name they have been known ever since.

The grand discovery.

The origin of the Indians, like that of all human races, is lost in antiquity. The latest researches place the cradle of mankind, not in the neighborhood of the Caspian Sea, as was long supposed, but in southeastern Russia. Thence in the remote ages, the Aryan race by successive migrations, moved in different directions and in time peopled the world. Climatic and other influences produced the various types of races. Some

Origin of the Indians.

of the wandering tribes probably found their way across the narrow Bering Strait, and gradually moving southward, peopled in time the two American continents.

The mound-builders.

In many portions of the west and especially in the Mississippi valley, are found immense mounds of earth that were supposed to have been erected by a prehistoric race that existed long before, and were destroyed by the Indians, but it has been established that these vast piles of dirt, most of which were burial mounds, were heaped up by the Indians themselves at no very distant time in the past. When Columbus discovered America, the mound-builders were at work, and did not wholly cease their labors until a considerable time later. The common belief is that the Indians are dying out, and in the course of time will wholly disappear. This is an error. While in some instances tribes have vanished, others have increased and the total number of aboriginal Americans to-day is very nearly, if not quite as great, as at any time in the past. Within the limits of the United States, there are a quarter of million of Indians, and the continent contains about 400,000. The Iroquois or Six Nations was the most powerful league of Indians ever known, and although the members are now widely scattered, many living in Canada, there are more of them than ever before. Major Powell's classification, based on language, divides the red men into fifty-nine families, which represent more than eight hundred tribes. The most important are the Algonquins, one hundred thousand of whom make their homes in Canada.

A common error.

Columbus believed he had reached the shore of Cathay or China, and to the day of his death never dreamed of the grandeur of his discovery. He cruised along the shores of Cuba and Haiti, landing at different points. The simple minded natives treated their strange visitors with kindness. The cupidity of the Spaniards was excited by the sight of many ornaments and trinkets of gold, and when the *Santa Maria*, the largest of the caravels, was wrecked, a party willingly remained behind. They treated the natives with such ferocious cruelty that the Indians turned against them and slew every man. Thus the first visit of the Spaniards was marked by blood, and the frightful record was kept up to the end.

Fate of the first colony.

Columbus reached Spain, March 15, 1493. The news of his great discovery created a profound impression throughout Europe, and caused intense gratitude and joy in Spain. All possible honors were heaped upon him, and when six months later, he embarked upon his second voyage, he was almost overwhelmed with the crowds that clamored to go with him. The wildest stories were believed and every man was certain that he could gather up gold as he gathered pebbles in his own land.

Second voyage of Columbus.

While Columbus was one of the greatest of all discoverers, he was a poor colonizer and handler of men. His attempts to found settlements in the New World were failures, and disappointment and sorrow crowded upon him. He was harassed by envy and intrigue at court, and while absent on his third voyage, was sent back to Spain in chains. Queen Isabella did all she could to repair the shameless wrongs inflicted upon the old admiral, who died broken-hearted in May, 1506. He had made four voyages across the Atlantic, and saw the coast of South America, but, as has been said, died under the belief that all the islands and lands which he discovered belonged to eastern Asia.

Death of Columbus.

Meanwhile, other important voyages of discovery had been made. John Cabot, who like Columbus was an Italian, but was in the service of England, sailed from Bristol, in May, 1497, with a small crew and in the latter part of the following month, saw the coast of Labrador. Thus Cabot was the first white man of the fifteenth century to see the American continent itself. Nearly a year later, Cabot accompanied, it is generally believed, by his son Sebastian, sighted the mainland somewhere south of the point discovered the year before, and skirted the continent as far south as Florida. Upon these voyages of the Cabots, England based her claim to the North American continent.

Discoveries by the Cabots.

A third Italian, Americus Vespucius, claimed to have made several voyages to America, the first in 1497–98. This is disputed by some investigators, but the written accounts of Americus Vespucius attracted wide attention. In 1507, a German professor of geography, Martin Waldseemüller, suggested that the South American continent, coasted by Vespucius in 1501–02, should be named AMERICA in his honor. Waldseemüller at that time believed that the land discovered by Americus Vespucius was independent of that first seen by Columbus. His suggestion was accepted and naturally the name America gradually included both continents.

Origin of the name of America.

In 1497, Vasco da Gama sailed from the port of Lisbon and passed around the Cape of Good Hope to India, whence he returned in 1499, his ships laden with the valuable products of that country. Thus Portugal solved the problem that had long baffled navigators, and the western route to India was abandoned for the southern.

Vasco da Gama's discovery.

Portugal in those days was among the foremost maritime nations. In 1500, one of her fleets under Cabral, while bound for India, passed so far to the westward, that the Brazilian coast was sighted. Cabral sent one of his ships home with the news. Spain and Portugal had made an agreement that all lands east of a meridian passing 370 leagues west of Cape Verde Islands should belong, no matter by whom discovered, to Portugal, while those to the west should be the property of Spain. The new land lies east of the "Line of Demarcation," and thus it was that the immense country of Brazil became a Portuguese possession while the rest of the continents was claimed and partly occupied by Spain.

Portuguese discovery of Brazil.

It required a good many years to convince Europe that America was not a part of Asia. In 1512, Ponce de Leon, searching for the fabled Fountain of Youth, coasted Florida, and the following year, Balboa, another Spaniard, led a small party from Darien across the narrow mountainous section, and was the first white man to gaze upon the South Sea, or Pacific Ocean, the mightiest body of water on the globe. In 1519, Ferdinand Magellan, a Portuguese captain, disgusted by his treatment at home, entered the service of Spain, and sailed to the westward in command of five ships. He passed through the straits named in his honor, and entering the Pacific, crossed to the Philippines and Moluccas or Spice Islands. Magellan was killed in an affray with the Filipinos, but one of his ships, with a few survivors, doubled the Cape of Good Hope and arrived in Spain in 1522. This was one of the most memorable voyages ever made, for it was the first time that a ship had sailed around the world.

Discovery of the Pacific Ocean.

First circumnavigation of the globe.

The size and contour of South America became fairly well known, but the knowledge of North America advanced more slowly. No one suspected its breadth, but supposed that it was a narrow strip of land, which could be readily crossed to the Pacific. We shall find that more than a hundred years after the discovery by Columbus, the explorers on the eastern coast sailed up many of the rivers, confident of soon reaching the other side of the country. In most of the English grants of lands, the western boundary was made the Pacific Ocean. Little did those rulers suspect that when the colonists landed on the eastern coast of America they were only half way to the Pacific.

Ignorance of the North American continent.

More than a hundred years passed after the death of Columbus before the first permanent English settlement was made in the New World. The principal nations concerned in its exploration and colonization were the Spaniards, French, English and

Principal maritime nations.

Dutch, and we will now sum up the work done by each. Portugal, despite its great maritime power, kept away from America (with the exception of Brazil, as already mentioned), because of an agreement with Spain.

Fortunately for us, Spain gave her chief attention to the southern or warmer regions. Her attempts at colonization were a curse, and the tread of her people was like that of the horse of Attila, who claimed to be the Scourge of God. They slew and massacred the Indians for the love of slaying and massacre, often doing so when their own interests called for humanity and justice. They were greedy for gold, and no cruelty or crime was too atrocious to check them in their quest for it.

Character of the Spanish explorers.

The Spaniards, in their search for wealth, penetrated into Yucatan and Mexico, and, during the early years of the sixteenth century, conquered, with the exception of the northern and southern extremities, the countries between Mexico and Chili. They founded and held colonies in different portions of South America until the first quarter of the nineteenth century, when a general revolt took place and the various dependencies threw off the Spanish yoke. Juan Ponce de Leon was the first to enter the territory within the present limits of the United States. This old and wrinkled adventurer, who was a member of the second expedition of Columbus, came over from Cuba, with an expedition in 1513, in search of the fabled Fountain of Youth, of which he had heard fantastic accounts from the Indians. On Easter Sunday he sighted Florida, which he named "Terra de Pascua Florida" (Land of Easter), a name which has clung to it ever since. While trying to form a settlement on the coast in 1521, he was killed by the arrow of an Indian, and the colony came to naught.

Ponce de Leon.

Vasquez d'Ayllon, sailing from Haiti, in 1524, coasted northward to Chesapeake Bay, searching for a northwest passage to Asia. Failing of success, he planted a colony two years afterward near the site of Jamestown, founded by the English about eighty years later. The colony survived only a few years, disappearing so utterly that not a trace of it remained.

D'Ayllon.

In 1528, Narvaez landed four hundred men on the northern coast of the Gulf of Mexico and began groping for a new native empire to conquer. Finding none, they built boats and reached the mouth of the Mississippi, where Narvaez and many of his men were drowned. The remnant fell into the hands of the Indians, and all perished except three Spaniards and a negro. These, because of their complexion, were viewed with awe by the red men who spared their lives. After eight years of wandering, and having journeyed 2,000 miles, the four reached the Gulf of California, and at a Spanish outpost found some of their countrymen. One of the survivors, Cabeza de Vaca, published an account of their wanderings and wonderful adventures, which roused wide interest and drew attention to the distant region.

Narvaez.

Among the results of this narrative, was the expedition of Fernando de Soto, which left Cuba in 1539. His fleet consisted of nine ships, 570 men and a considerable number of horses. Landing in western Florida, he pushed northward, fiercely resisted by the Indians, tormented by myriads of mosquitoes and oppressed by smothering heat. De Soto crossed the Mississippi in the spring of 1542, and is believed to have ascended the western banks as far as the present city of New Madrid. He then turned back, and on the downward voyage died of fever and was secretly buried in the Father of Waters. The survivors, numbering about one-half the original party, built boats and floated down the river and made their way to Tampico, Mexico.

De Soto's discovery of the Mississippi.

In 1540, Francisco de Coronado led an expedition northward from Mexico in search of the seven marvelous cities that were supposed to be located somewhere in the interior. He discovered the Grand Cañon of the Colorado River, and found the seven cities, which were the pueblos of the Zuñi Indians in New Mexico. But Coronado saw nothing of the gold and silver which had drawn him and his men thither, and his expedition was a grievous failure. And yet, as we learned long ago, the mountains to the west of him contained millions of dollars worth of the precious metals.

Coronado's expedition.

The persistent attempts of the Spanish to found a permanent colony attained success in 1565, when Pedro Menendez, a merciless miscreant, after massacring all the French men, women and children who had settled there, established St. Augustine in Florida, which is therefore the oldest city in the United States.

First permanent settlement in the United States.

The French entered the field of American exploration subsequently to the Spanish. Some of their fishermen came with those of other nationalities to the banks of Newfoundland in quest of codfish before 1510, and the industry continues to the present time. In 1524, an Italian, Verrazano, in the service of France, which was at war with Spain, passed along the American coast from North Carolina to New Hampshire. Little, however, is known of this voyage, and some have expressed doubts that it was ever made.

French explorers. — Verrazano.

In 1534, Jacques Cartier, a French explorer, sailed up the St. Lawrence, confident that he would shortly reach the Pacific. He was turned back by the rigors of winter, but the following year ascended the great stream to the rapids where the city of Montreal was afterward built. Cartier and Sieur de Roberval attempted to found a French colony in 1540–43, but were compelled to abandon it, and many years passed before affairs at home allowed the French to resume their efforts at colonization in America. One such attempt, however, was made in 1562–65, when the Huguenots, under the lead of Jean Ribault formed a settlement in Florida. This was the one whose inhabitants, as already stated, were massacred, root and branch, by the infamous Spaniard, Menendez. The pretext for this slaughter was that the French were invaders of Spanish territory. In 1568, a private expedition slaughtered the Spaniards in turn. Menendez was in Spain, but he returned to Florida in 1570, and his countrymen retained their grip upon the land. In 1604, the French effected their first permanent settlement in America at Port Royal, in Nova Scotia. A second was made in 1608 at Quebec by Samuel de Champlain, who is known as the founder of Canada.

Cartier.

Huguenots in Florida.

Champlain.

England, however, was the great colonizer of America. After the failure of several attempts, King James I. granted a charter to a stock company formed for the settlement of the region known as Virginia, whose northern boundary was the 45th parallel of latitude (the northern boundary of New York and Vermont), and the southern limit the 34th parallel, near Cape Fear. This company was composed of two branches, one consisting mainly of London and the other of Plymouth merchants. The London Company owned the coast from Cape Fear to the mouth of the Potomac; the Plymouth Company from Long Island to Nova Scotia. Between the two territories was a region of three degrees, which was open to both companies, with the condition that neither should plant a settlement within a hundred miles of one already begun by the other. This, it will be noted, made the tract a prize to be won by the company which first colonized it. The western boundary of these grants was the Pacific Ocean, which at that comparatively late day, was supposed to be at no great distance away. Each company promptly sent out colonists. Those of the Plymouth branch established themselves at the mouth of the Kennebec River, and spent the winter of 1607–8 in their huts, whose chimneys just peeped through the tops of the snow

The London and Plymouth Companies.

The Popham Colony.

drifts. Freezing and starving, the survivors seized the first chance to take ship to England, content to leave the frigid region to wild beasts and Indians. This colony is known as the Popham Colony, because Sir John Popham of England was the main promoter of it.

Better fortune attended the efforts of the London Company. Three ships, containing 105 men and no women, were sent out early in 1607, and, in the month of May, ascended the James River for some fifty miles, and began the settlement of Jamestown, which was the first permanent English settlement in the New World. Most of these pioneers were "gentlemen," who had no taste for labor and expected to gather enough gold to enrich themselves, and then to return to England to spend it. As a consequence, the colony suffered dreadfully and more than once was near its last gasp. That it did not die was due to the resolute vigor and sound sense of one man, Captain John Smith. He was a great boaster (and certainly has more namesakes to-day than any other person), and it is quite likely that many of the stories he told were imaginary, but his manly character, his unselfishness and his sturdy virtue, were the salvation of the colony. The two years he spent at the head of affairs won him the deserved title of the Father of Virginia. An impressive proof of this was furnished in 1609, when, in the winter and spring after his departure, out of the 500 colonists all perished except 60.

Settlement of Jamestown, Va.

Captain John Smith.

But the colony was strengthened by the furnace of affliction. The London Company increased its capital and members and was made a corporation distinct from the Plymouth Company. A council in London was the controlling authority and appointed the governor in Virginia. Each man was allowed to reap the benefits of his own toil, instead of sharing it in common as at first, and good order was established.

Improvements in the colony.

The discovery was made that tobacco could be cultivated with the fullest success. Climate and soil could not have been more favorable, and the culture of the plant quickly became so profitable that the settlers raised barely enough of the cereals to meet their necessities. The weed was grown on the streets of Jamestown, and hundreds of enterprising settlers came to Virginia and devoted their energy to raising tobacco. In a little more than half a century after the beginning of the industry, Virginia exported 6,000 tons annually.

Tobacco.

In the summer of 1619, a Dutch man-of-war anchored off Jamestown with a number of negroes that had been kidnapped in Africa. Twenty of them were sold to the colonists and set to work cultivating tobacco. Thus it was that the hideous institution of African slavery was introduced into our country to grow until it threatened our national existence, and not to be slain until it had cost the lives of a million men.

Introduction of African slavery.

When African slavery was established in Virginia, the population was about 4,000, divided among eleven settlements or boroughs. Their prayer for a representative government was granted, and each borough sent two representatives or "burgesses," who came together in the little church at Jamestown, on July 30, 1619. From that day to the present, the assembly of Virginia has been known as the House of Burgesses. King James was not pleased with these proceedings. He had long been dissatisfied with the growing power of the London Company, which was politically opposed to him. He brought about the annulling of its charter in June, 1624, and Virginia became a royal colony directly subject to the authority of the king.

A representative government.

Virginia made a royal colony.

In 1642, Sir William Berkeley was made royal governor of Virginia and held the office for thirty-five years. He was an intense partisan of the king, and refused to recognize Cromwell, when he had overthrown the monarchy in England. He was a tyrant, a bigot, a foe to popular government, but able, and brave. In 1676, when the colony contained nearly 50,000 white people, and the Indians were committing many outrages, Berkeley refused to call out the militia, through fear that they would turn against him, because of his oppressive rule. Nathaniel Bacon, a young planter, led the volunteers against the Indians, because of which the enraged governor proclaimed him a rebel. When everything promised the success of the uprising, Bacon fell ill and died. Left without a leader, his followers were speedily overcome and more than twenty of them were hanged. Berkeley was recalled to England, where his chagrin and grief hastened his death. During the civil war, Jamestown was burned and never rebuilt.

Bacon's Rebellion.

The next settlement in order of time was made by the Dutch. The wealthy Dutch East India Company sent out Captain Henry Hudson in the spring of 1609 to search for a shorter route to India. He sailed from Amsterdam with a crew of only twenty men. He first headed for Nova Zembla, but was turned back by the immense quantities of ice. He then crossed to the American coast, and finally entered the mouth of the Hudson, which he ascended to the present site of Albany. The narrowing shores had already told him that he never could reach Asia by following that river. Upon his return to England, the Dutch claimed the territory which he had explored. Hudson was sent out again the following year with another small crew. He entered the strait and bay which are named for him, but his men mutinied and set him, his son and eight others adrift in an open boat. They were never heard of again.

Captain Henry Hudson.

The Dutch lost no time in taking advantage of Captain Hudson's discovery. Their vessels sailed up the Hudson and opened a profitable fur trade with the Indians. They located on Manhattan Island and erected a fort and a few huts. This was in 1613, and these primitive cabins formed the foundation of the metropolis of the New World. A few years later, some of the settlers crossed into Bergen County, New Jersey, and established several trading stations. The territory claimed by the Dutch was called New Netherland. Within the ten years following, the first settlement, trading posts were located as far north as Albany, and as far south as Fort Nassau, near the present city of Philadelphia. The settlement on Manhattan Island was called New Amsterdam, and in 1664, contained 1,500 inhabitants.

Settlement of New Netherland.

Of all the Dutch governors of New Netherland, Peter Stuyvesant was the ablest. He came over in 1646, and ruled with an iron hand. He was stern, tyrannical, hot tempered and impatient of opposition. Because of the silver rings around one of his wooden legs, he was nicknamed "Old Silver Leg," but those who used the term took care that he was beyond hearing at the time. The colony flourished under his wise though severe rule, but in 1664, an English fleet suddenly appeared off New Amsterdam and compelled the surrender of the town. It almost broke the heart of Stuyvesant, but he could not help himself, and the new rulers treated the people generously. The name of the town was changed to New York. In the summer of 1672, the Dutch recaptured it, but on the conclusion of the war between England and Holland, New York was ceded to England (1674) and remained in her possession until the Revolution.

Colonial history of New York.

New Jersey was an offshoot of New York, forming from the first a part of New Netherland. The territory between the Hudson and Delaware, and north to forty-one and a half degrees latitude, was granted to Lord Berkeley and Sir George Carteret by the Duke of York, and named New Jersey in honor of Carteret's defense of the Island of Jersey in the English Channel, against Cromwell, in 1649. A few years later, several Dutch and Swedish families settled in New Jersey, but their records are meagre. Captain Philip Carteret, the new governor arrived in 1665, and began the settle-

New Jersey.

ment of Elizabeth. The site of the present city of Newark was bought from the Indians a year later. It will be noted that Carteret made his settlements in the east, while Berkeley's were in the southwest. Later Berkeley sold his share to the Quakers, who organized the province into East and West Jersey, a distinction which to some extent is still preserved. There was much confusion over the question of land titles. In 1682, East Jersey was bought by William Penn and several associates, and thus all New Jersey came into the possession of the Quakers. In 1702, it was made a royal province, and attached to the government of New York, each province retaining its separate territorial organization. In 1738, New Jersey became independent and so remained. Its location kept it free from all trouble with the Indians, and down to the Revolution, its history was uneventful.

Religious persecution in England.

At the time of the founding of Jamestown, Virginia, and for a number of years later, there was a good deal of religious persecution in England. Believing the Established Church had become corrupt, many good people withdrew from it. These were known as Separatists or Independents. Others thought it was their duty to remain in the church, while trying to reform it. Such people were called Puritans. Because of their wanderings, members of both divisions are often referred to as Pilgrims.

Landing of the Pilgrims at Plymouth.

Persecutions at home led the Independents and Puritans to turn their attention to the New World, as the only country in which they could secure full liberty of conscience. Negotiations were opened with the London Company, and on the 6th of September, 1620, the *Mayflower* sailed from Plymouth, with one hundred and two persons, besides her crew, to found a new home on the other side of the Atlantic. After a tempestuous voyage the Pilgrims landed at Plymouth, December 21 (December 11, Old Style).

Other colonies in New England.

Those men and women were stern, austere, God-fearing people and of the right stuff for pioneers. Their sufferings from the arctic climate and the lack of food were so severe that half of them died before spring. The survivors held grimly to their work and there was no thought of returning to England. Conditions improved with the coming of milder weather. Crops were planted, friendly relations were maintained with the Indians, and new additions were made to the colony. In 1629, the Puritans crossed the ocean and formed the Massachusetts Bay Colony. Many of the members were wealthy, and all were of a high character. They settled near Salem in the year named and founded Boston two years later. Everything seemed prosperous and the population rapidly increased.

"Tall oaks from little acorns grow."

Governor Winthrop of the Massachusetts Bay Colony brought a single apple cutting from England. This was the parent of the vast apple industry of to-day, amounting to almost 200,000,000 bushels annually, of which the State of Maine alone has exported half a million barrels in one year. The apple is the best all round fruit in existence, no product of the tropics equalling it. Scientific evolution has carried it to perfection. The entire crop of some growers — such as of the "Albemarle pippin" of Virginia — are purchased in England before the fruit is in blossom. No country in the world produces such fine apples as ours.

Puritan intolerance.

Although the Pilgrims came to the New England wilderness to escape religious persecution, they showed at times an intolerance toward those of a different faith. Because Roger Williams preached too plainly, he was banished and fled to the Narragansett Indians, who gave him welcome. He and several friends, in 1636, began a settlement which is now the city of Providence.

A short time previous, Massachusetts settlers passed into the Connecticut valley, the first real settlement being made in the autumn of 1635. A fort was built at Saybrook, and held against the threats of the Dutch. Hundreds of emigrants made their way thither from Massachusetts. Hartford was founded the same year, and other towns were soon settled. There was a good deal of trouble with the Indians. The Pequots, having committed many outrages, were exterminated in 1636, and forty years later, King Philip, one of the greatest Indians that ever lived, threatened the existence of New England. Six hundred white people were killed, many more wounded, a dozen towns laid in ashes, and five hundred buildings burned during the war. In the end, King Philip was slain and the power of the red men broken.

Settlement of Connecticut.

It is worth noting that Harvard College, founded in the same year as the Pequot War, was opened in 1638, and incorporated in 1650. The printing press attached to the college in 1639, was for a long time the only one in America.

Harvard College.

The first settlements in "Laconia" were made at Dover and Portsmouth, soon after the region was granted to Captain John Mason, in 1623. Mason died before he could enforce his claims, and the few sparsely settled towns were added to Massachusetts in 1641. In 1679, they and the surrounding wilderness were created into the royal province of New Hampshire, by King Charles II.

New Hampshire.

The United Colonies of New England included Plymouth, Connecticut, New Haven and Massachusetts and was formed in 1643. The district of Maine was joined to Massachusetts in 1652–53. This league lasted until 1684.

The United Colonies of New England.

A charter secured by Roger Williams in 1644, united Providence, Newport and Portsmouth under the name of the "Incorporation of Providence Plantations, in the Narragansett Bay, in New England." In 1663, a charter established the province of "Rhode Island and Providence Plantations." The form of government thus created continued in force for about two hundred years.

The Rhode Island and Providence Plantations.

The arrival of several Quakers at Boston in 1656 caused a persecution of the sect, who, it must be admitted, gave great provocation. Four of them were put to death before the laws were made less rigorous. In 1688, the witchcraft delusion broke out in Salem, and before it ran its dreadful course, twenty persons were executed. This craze was one of the strangest that ever afflicted a civilized community.

Persecution of the Quakers.

The Witchcraft delusion.

In 1684, Massachusetts, after a long dispute with England, lost her charter and became a royal province. When news reached America in 1689 that James II. had been dethroned, and his nephew William III., Prince of Orange, had been made king of New England, New England and New York rose in revolt, the tyrannical Governor Andros was thrown into prison, and the old government restored. King William, however, was not wholly pleased with what had been done. He allowed Connecticut (1692) and Rhode Island to keep their old charters, annexed Plymouth to Massachusetts, made New Hampshire a separate province, and united Maine and Nova Scotia (the latter recently captured from the French) to Massachusetts, which was permitted to retain her system of free government. The bone of contention, however, lay in the governorship. Hitherto the ruler had been elected by the people, but the crown insisted upon appointing him. It remained for the war of the Revolution to settle the dispute.

Subsequent history of New England.

By this time, Massachusetts was the real New England, as Virginia was the real South. France and England had become the rival powers in the New World, as they had been for centuries in Europe. France had settled Canada to the north and the representative colonies on this side of the Atlantic warred with each other, when-

King William's War.

ever the nations at home were involved. The French were wiser than the English in that they cultivated the friendship of the Indians, who served as their allies in devastating the frontiers. King William's War broke out in 1689 and lasted for eight years. There were no decisive successes by either party in this country, but many cruel outrages were perpetrated.

In 1702, France and Spain joined in a war against England, which was maintained until 1713. The New England border suffered greatly at the hands of the red allies of France. An attempted invasion of Canada in 1711 resulted in crushing disaster. Previous to this, Port Royal had been captured and its name changed to Annapolis. The treaty of peace ceded Nova Scotia to England.

Queen Anne's War.

England and France went to war again in 1744, and maintained hostilities for four years. The English colonies gained a brilliant success in the capture of Louisburg, one of the strongest fortresses in the world (1745). So magnificent was this achievement that England was illuminated with bonfires, and France appalled by the stupendous catastrophe, and yet, when the treaty of peace was signed, England gave Louisburg back to France. This restoration was one of the innumerable illustrations of the folly and curse of war.

King George's War.

We must now turn our attention again southward. We remember that William Penn, the good Quaker, and several of his sect became the owners of New Jersey. Penn's father was a British admiral to whom, at his death, the government owed eighty thousand dollars. The son accepted as payment for this debt the grant of forty thousand square miles of land, which now forms the State of Pennsylvania. The English king signed this grant, March 4, 1681.

William Penn.

William Penn founded one of the most beneficent governments ever organized. Its foundation was the Golden Rule. Although he had paid his sovereign for the territory, one of his first acts upon reaching the province, was to call the leading Indians together and pay them, the real owners, for their lands. This secured the friendship of the red men, who in their ferocious warring against the invaders of their country, invariably spared the Quakers. Perfect freedom of conscience was granted to all and justice secured to every one by Penn, whose own life was that of a practical and consistent Christian.

Philadelphia was laid out in 1681 and prospered from the beginning. Schools, chapels and a printing office were soon established, and the city remained the chief one of the colonies until after the Revolution. In 1701, Penn signed a new constitution which allowed the three lower counties, now forming the State of Delaware, to have a separate government. A few Swedes and Finns had settled on Delaware Bay in 1638. They were joined by others, and in a few years quite a thriving settlement existed a short distance below the site of Philadelphia. This was an eyesore to Governor Stuyvesant of New Amsterdam, who stormed and threatened. Finally in 1655, he captured the offending posts and Swedish rule in America was ended. The Swedes who remained were indifferent to the change and easily became Dutch, with the name of the province altered to New Amstel.

Delaware.

The Roman Catholics, like the Separatists, suffered cruel persecution in England. In order to secure a refuge for those of his faith, Sir George Calvert, or Lord Baltimore, asked King James for a grant of land in America. Sir George died soon after and the grant was issued to his son Cecil, in June, 1632. He named the new province Maryland, as a compliment to Queen Maria. It included at that time the present state of Maryland, Delaware, and portions of New Jersey and Pennsylvania. This, it will be observed, was about a half century before Pennsylvania was granted to William Penn.

Maryland.

The first settlement was made at St. Mary's in 1634. The Indians were treated as kindly as by Penn, and their friendship was thus obtained from the start. All would have gone well, but for the resentment of the Virginians at what they considered an intrusion upon their territory. The angriest of all the Virginians was William Clayborne, amember of the council, who carried on a thriving trade in the country to which Lord Baltimore possessed a good title. When Clayborne sent his little vessel upon its usual trading voyage in 1635, the Marylanders seized it. Clayborne hurried out an armed boat to recapture it. In the fight which followed, Clayborne's captain and two of his men and one of the Marylanders were killed. Lord Baltimore demanded the surrender of Clayborne, and Virginia was so indignant that she turned her governor out of office, because he insisted that Clayborne should go to England to meet the charges of Lord Baltimore. The governor and Clayborne went to England on the same ship. The king sustained the action of the governor and sent him back to Virginia, whose council was sharply rebuked for its illegal action.

Lord Baltimore and the Catholics were so liberal in their treatment of all faiths that a good many people removed to Maryland from Virginia. Not only that, but they flocked thither from New England and all were cordially welcomed. So many indeed came that they soon caused trouble. Clayborne roused such enmity against Calvert that he had to flee from the colony and a Virginian was elected as his successor. But Calvert was not the man to submit meekly to such injustice. Although in Virginia, he gathered a strong party of friends, dashed into Maryland, captured St. Mary's, and placed himself at the head of affairs, in August, 1646. Clayborne made his exit from Maryland as hurriedly as Calvert had done some time before.

Civil war in Maryland.

There was continual strife between the Catholics and Protestants. The former, as we remember, had been liberal toward other faiths, but when the Protestants came into power they treated the Catholics with harshness. Peace came in the latter part of 1657, when a mutual amnesty was declared by Virginia and Maryland and liberty of conscience guaranteed. The proprietary rights were taken from Lord Baltimore in 1691, and Maryland remained a royal province for a quarter of a century. Then their rights were returned to the Baltimore family and retained by them until the Revolution.

Religious troubles.

In 1663, the territory lying between the St. John's River in Florida and the southern boundary of Virginia was granted to a number of noblemen by the king of England, the grant being extended two years later to half a degree north and a degree south. In the year named, a tract thirty-two miles square, at the mouth of the Cape Fear River was bought from the Indians by a party from Barbadoes. The little colony planted there was joined a year later by others, while immigrants from Bermuda, Virginia, and New England, were scattered along the northern shore of Albemarle Sound. In 1670, a settlement called Charles-town was begun three miles above the mouth of the Ashley River. The site proved unhealthful and ten years later, a removal was made to the present Charleston. Matters were in a continual turmoil, and the Carolinas were often afflicted with rogues for governors. Finally, the disgusted proprietors, in 1729, returned seven-eighths of the land and the right of government to the crown. The colonies were separated into North and South Carolina, as they have remained ever since.

The Carolinas.

Within less than a hundred years any man in this country, who was unable to pay his debts, could be thrown into prison for a longer or shorter term. It was ten-fold worse in England, where the head of a family who had become poor through illness or no fault of his own, could be cast in jail and kept there until he died, while his wife and children starved. The condition

Georgia.

of the debtor classes became so pitiful that a general sympathy was aroused, in which the king shared. General James Edward Oglethorpe, a wealthy member of Parliament, secured a grant of land which he named Georgia, in honor of his sovereign George II. Thither he shipped one hundred and twenty of the most deserving debtors, who founded the city of Savannah, in February, 1733. Oglethorpe was an able governor, a brilliant general and one of the best of men, but of colonial Georgia, it may be said that it was killed by too much kindness. It was nursed and coddled, many of the laws were unwise, and the settlers were often treated as if they were so many children. At the end of twenty years, there were less than two thousand people in the whole colony, and industry was at an end. In 1752, the discouraged trustees surrendered the patent to the crown. Georgia has made such strides since then, and especially since the War for the Union, that she is known as the Empire State of the South.

There were now thirteen colonies planted along the Atlantic coast, stretching from New Hampshire to Georgia. The settlements nowhere extended far into the interior, the vast bulk of the American continent being an unknown wilderness, in which lived only Indians and wild animals. All the colonies were English, united by common ties and aims, and all were loyal to the mother country, despite the fact that she gave more than one just cause for grievance.

While Spain, Holland and other nations had declined, England and France had steadily increased in power. They were rivals in the New World as well as in the Old. Because of the discovery of the Cabots, England claimed the entire country to the Pacific. France planted her settlements in the valley of the St. Lawrence, and pressed not only westward but southward. Her eyes were fixed upon the Gulf of Mexico, and her dream was the establishment of a mighty empire in the valley of the Mississippi, stretching from the Great Lakes to the Gulf. She guarded this long line by more than sixty military posts, and pushed her occupation with resolute vigor. Should England attempt to extend her settlements to the Pacific, she would confront a mountain wall before half the distance was passed. The projected French empire split the projected English kingdom in twain.

England and France rival nations in the New World.

Between the settlements of the two nations, lay an immense area which both claimed, and both began colonizing. The rightful owners were the Indians, but neither side gave any thought to them. Their province was to furnish furs in exchange for the white men's trinkets. After a time, the English traders who made excursions among the Indians, came upon French traders engaged in the same business. This was in the territory which Virginia claimed by virtue of her old charter. To shut out the intruders, the Ohio Company was formed and granted a half million acres to be located in the Ohio valley. The king ordered that settlement within the territory should be begun at once, but the French were first on the ground.

The impending conflict.

Before long, collisions took place between these advance parties, and the situation grew more threatening. Duquesne, the French governor of Canada, in the spring of 1753, sent a large number of men down the Allegheny to colonize the region. There could be no mistaking the meaning of this invasion, and Virginia was roused to indignation. Governor Dinwiddie drew up a courteous but earnest remonstrance and sent it to the French commandant at Erie, five hundred miles distant from Williamsburg, the capital of Virginia. This letter was carried on horseback, through many perils, by GEORGE WASHINGTON, twenty-one years of age and lately appointed major and adjutant-general of the militia of Virginia.

George Washington.

The French officer replied that he was at his post by order of his superior officers; that he could not discuss the questions raised by Governor Dinwiddie, but held it his duty to expel all intruders into the disputed territory. This meant war and Virginia did not hesitate. The assembly voted ten thousand pounds, and, in the spring of 1754, a party was despatched with orders to build a fort at the junction of the Allegheny and Monongahela rivers, on the site of Pittsburg. The French, however, were ahead of the Virginians, drove them off, and built Fort Duquesne. Washington was approaching with two hundred men, with Colonel Frye as his superior officer. They collided unexpectedly with the French, of whom ten were killed and twenty-one taken prisoners. In this fight, Washington carried a musket at the head of his men, and it is claimed he fired the opening shot of the French and Indian War. Succeeding Colonel Frye, who was mortally wounded, Washington withdrew to Great Meadows, where he hastily built Fort Necessity. He was soon attacked by a thousand French and Indians and compelled to accept terms which forced him to leave the country.

The first collision.

There are few wars in which there is perfect unanimity of sentiment on each side. New England favored the conflict because her border settlements had suffered greatly at the hands of the French and their allies, the Indians; New York reluctantly voted an appropriation of ten thousand pounds; Maryland was equally tardy in appropriating six thousand pounds; New Jersey and Pennsylvania did nothing, and even in Virginia, whose territory had been invaded, the sentiment was not unanimous. England, however, was in earnest and began formidable preparations for the struggle whose prize was the American continent.

Divided sentiment.

On June 19, 1754, delegates from the four New England colonies and from New York, Pennsylvania, and Maryland, assembled at Albany, N. Y. The chief purpose was to affect an alliance with the Six Nations that would hold them neutral in the impending war, for, if that powerful league joined the French, as there were good reason to fear they would do, the consequences would be appalling to our frontier settlements. Providentially the alliance was made and the threatening cloud dissipated. The delegates then gave their attention to plans for a more perfect union of the colonies. Benjamin Franklin submitted an ingenious scheme, but it was rejected by the king, who plainly saw the shadow of INDEPENDENCE looming in the background.

Colonial convention.

It is a singular fact that fighting on sea and land went on for two years before England and France would admit that perfect peace did not prevail between them. Then they threw off the mask and plunged into the prodigious struggle. In the spring of 1755, General Braddock arrived from England with two regiments of regulars, to which were added enough provincials to increase the force to more than two thousand men. Braddock made Washington a member of his staff, and the young Virginian warned him of the nature of the fighting before him. Braddock scorned the advice, and bitter was the penalty he was forced to pay. While marching against Fort Duquesne, and when within ten miles of the fort, he was furiously attacked by Indians who fired from behind rocks and trees, and were securely protected from the volleys of the regulars. After Braddock had had five horses shot under him, he was brought dying to the ground. Twenty-six officers were killed and thirty-seven wounded out of a total of eighty-two, while one-half the soldiers were slain or disabled. The loss of the French was only three officers and thirty men. Washington took command and brought off the survivors, else none would have escaped.

Braddock's massacre.

Under the plea of military necessity, a force of New England troops landed in Nova Scotia, or Acadia, in 1755, and gave the people the choice between taking the oath of allegiance and leaving the country. There was so much disaffection among these people, who had recently been conquered from the French, that there

Expulsion of the Acadians.

was some justification for the harsh step of England. None the less, the picture of six thousand Acadians turning their backs forever upon their native land, and of the breaking up of families and friends, many of whom never met again, is one of the most pitiful in all history.

The first two or three years of the war were more favorable to the French than to the English. War was formally declared between England and France in May, 1756. The two nations at that time were engaged on opposite sides of the Seven Years' War, one of the most stupendous that ever shook Europe to its foundations. William Pitt, the foremost statesman of his time, became prime minister of England and infused a vigor and skill in the management of affairs which soon brought decisive results. Twenty-two thousand regulars were sent to America, and the colonies raised twenty-eight thousand troops to aid in the prosecution of the war. The French abandoned Fort Duquesne, and Washington himself planted the English flag on the ramparts. The place was named Pittsburg in honor of England's great minister.

Turning of the tide.

The vigorous blows of Pitt told in every quarter. Louisburg, after a comparatively brief siege, was captured, and Fort Frontenac, on the site of Kingston, Lake Ontario, was taken, the one disaster being the defeat of the English in their assault upon Ticonderoga.

The year 1759 brought the decisive triumphs of the British arms. Forts Niagara and Ticonderoga were wrested from the French, and General Wolfe laid siege to Quebec, defended by Montcalm. Nearly three months passed before Wolfe was able to find a path by which his men could climb to the plain in front of the city, known as the "Heights of Abraham." His men made their way up this steep path in the darkness of night, and at daylight on the 13th of September, the astonished Montcalm saw the 5,000 British troops drawn up in battle array in front of Quebec. The valiant commander lost no time in leading out his garrison and attacking the enemy. The French were defeated, both Montcalm and Wolfe being mortally wounded in the battle. Montreal was captured the following year, and the treaty of peace between England and France gave all the possessions of the latter in America to England, except two insignificant islands near Newfoundland, and the settlement of New Orleans to the eastward of the Mississippi. The battle of Quebec, slight as it was compared to many of more recent times, ranks among the great struggles of history, for its result was to change the face of a continent.

Triumph of England.

Let us note the great changes that followed the crowning triumph of England. Western New Orleans and the vast region beyond, known as Louisiana and extending to the Rocky Mountains, were ceded to Spain, which at the same time gave Florida in exchange for Cuba and the Philippines, which she had conquered during the Seven Years' War. It is well to remember that Spain restored Louisiana to France in 1800, and three years later the United States bought it from Napoleon Bonaparte for fifteen million dollars.

The Partition of a continent.

It has been shown that from the beginning neither France nor England paid the slightest heed to the rights of the Indians, who naturally showed their resentment. The French, as we know, cultivated the good will of the red men, who, as a rule, were their allies. At the conclusion of the French and Indian War, the French were obliged to transfer all their western posts to the English. The garrisons of the latter took possession of these forts, with no effort on their part to win the good will of the neighboring red men. They were soured and revengeful, and Pontiac, chief of the Ottowas, a man of marked ability, formed a conspiracy among the principal tribes for a simultaneous attack upon all the posts. These assaults, made in May and June, 1763, were successful in nearly every case, except at Detroit and Fort Pitt, which were warned in time to make preparation. Detroit was besieged by Pontiac in person for more than six months, and was saved through the arrival of reinforcements. Colonel Henry Bouquet by his skill, vigor and daring, defeated the Indians in one of the fiercest of battles and prevented the fall of Fort Pitt. Like King Philip, nearly a century before in New England, Pontiac saw all his hopes vanish in air, and, like the famous Wampanoag chieftain, he was killed by one of his own race, who was bribed to do the deed by an English trader, in 1769. Before this, the Indian confederacy had been shattered, and England had taken undisputed possession of the vast region ceded to her by France.

Pontiac's conspiracy

II. The Revolution.

Benjamin Franklin, the best authority, estimated that in 1766, there were 300,000 males, between the ages of sixteen and sixty years, in the American colonies. Many of them had received military training in the French and Indian War, which closed about a dozen years before the breaking out of the Revolution. It may be said that the former served as a West Point for the latter.

Strength of the colonies.

The continuous oppression of England goaded the colonies to revolt. Following the policy of making them dependent upon the mother country, manufactures were forbidden in America. The Carolinas were not allowed to make tar, and turpentine, nor was one colony permitted to manufacture hats to be sold in another colony. The printing of the English Bible was an act of piracy, and legally a man could not fashion a horseshoe nail without the consent of Parliament.

Oppressive acts by England.

The first of the Navigation Acts passed in 1651, ordered all English products to be carried to the colonies in English or colonial vessels. In 1663, it was decreed that all our imports should come from English ports. The acts became almost a dead letter and smuggling was common. When George III. came to the throne, vigorous steps were taken to enforce the bad laws. Ships of war lay off the coast to stop trade with the French and Spaniards. In Boston and other towns, the king's officers broke into merchant's shops and houses in search of smuggled goods. Angry protests were made but were useless.

During the French and Indian War, the colonies spent $16,000,000, of which England repaid about one-third. Then she placed a tax upon the colonies, and, since they were not permitted to have any members in Parliament, this was "taxation without representation." The intolerable blow was the passage of the Stamp Act, in March, 1765. This ordered that stamps should be bought from the British government and put on all newspapers, pamphlets, legal documents, etc. It caused so much indignation, marked by rioting, that England repealed the act the following year. She did not give up her claim to the right to tax the colonies, however, and quartered troops upon them at their expense, in order to compel obedience to her unjust laws. This added fuel to the flame, and in a collision, March 5, 1770, in Boston, between the soldiers and citizens, three of the latter were killed and eight wounded. This is remembered as the Boston Massacre.

The Boston Massacre.

England now removed the tax from all articles except tea. The colonies refused to use or to receive the tea, and, in Boston, December 16, 1773, a number of citizens, disguised as Indians, broke open the chests on one of the ships and threw the tea into the harbor. England was so angered by the news that she closed the port of Boston, and sent General Gage there as military governor of Massachusetts. This roused the colonies, and they began making ready for the struggle which all saw was at hand. The First Continental Congress met at Philadelphia, September 5, 1774, with every colony represented, except Georgia, the weakest of all. This Congress, sometimes forced to fly to other towns; was in session until the close of the war. At its first meet-

The Boston Tea Party.

First Continental Congress.

ing, it praised the course of Massachusetts and condemned that of England.

At that time, and for one or two years later, the majority of Americans were not aiming for independence: they strove rather to compel the mother country to be just to them, and she had only to be so in order to hold them loyal for many years to follow. A few, however, clamored from the first for independence, and this number grew, as the chasm widened between England and the colonies. As has been said, the Revolution was the work of an aggressive minority.

General Gage sent a military force from Boston to Concord a few miles away, to destroy some military stores. The Americans had been warned and hastily gathered at Lexington, where, April 19, 1775, they were fired upon and eight killed and several wounded. This caused a hurried gathering of the patriots, who opened so hot an attack upon the retreating British, that, had they not been reinforced, they would have been cut off before reaching Boston. The news of the battle of Lexington was carried by men on horseback to the other colonies and a general uprising followed.

Events of 1775.

Thousands gathered at Boston and began throwing up intrenchments to shut in the British. Finding that the works on Breed's Hill commanded the city, General Gage sent a strong force, June 17, to dislodge the Americans. The latter made a desperate defence, but their ammunition gave out and they were driven from the defences. Meanwhile, Congress had appointed General George Washington commander-in-chief of the American forces, and he hurried to Boston, where, on July 3, he assumed command. Later in the year, General Richard Montgomery and Benedict Arnold led an expedition into Canada, which, as usual, ended in disastrous failure.

Washington pressed the siege of Boston with such vigor that on March 17, the British sailed away for Halifax, Nova Scotia. In June, a British fleet attacked Charleston but was repulsed. On July 4, Congress in Philadelphia, adopted the Declaration of Independence, which was received with rejoicing throughout the whole country. Henceforward the war was for independence.

Events of 1776.

Hostilities which had opened in New England, gradually moved southward. A superior force of the enemy defeated a body of Americans on Long Island in August, and Washington was compelled to withdraw from New York to White Plains, where he was repulsed October 28. Soon after, he began retreating through New Jersey toward Philadelphia, the British closely pursuing. Those were the darkest days of the Revolution and many of the patriots gave up in despair. Washington, however, never lost hope of final triumph and a devoted band clung to him. Most of his men were in rags, with scant food, no pay and without shoes, so that they left bloody tracks in the snow through which they plodded. The leader, when the fortunes of his country were at the lowest ebb, thrilled all patriotic hearts with renewed hope, by suddenly attacking a strong Hessian force at Trenton and making most of them prisoners. This memorable victory was gained on the morning of December 26.

Washington was in a critical position, with the ice-choked Delaware behind him and Cornwallis hurrying down from Princeton. But he slipped away, and on January 3, surprised and defeated the enemy stationed in that college town. Then he marched to Morristown, where he stayed in camp until May. The British now attempted to divide New England from the rest of the colonies, by forcing a large army like a wedge between the sections. It was under the command of General Burgoyne, but he was so hard pressed that, at Saratoga, October 17, he was compelled to surrender his whole force. This was the most decisive victory thus far of the war, and caused France to lend her assistance openly to the Americans.

Events of 1777.

Elsewhere matters had gone ill for the patriots. Washington could not drive back the force which landed on the Chesapeake Bay and marched overland against Philadelphia. He was attacked September 11, on the Brandywine and defeated. The enemy took possession of Philadelphia, and repelled an assault made October 4, upon them at Germantown. Nothing could be done, and Washington and his ragged, starving soldiers huddled together in the huts at Valley Forge, through the winter of 1777–78, while the British held high revel in Philadelphia, a few miles away.

In February, France made a treaty with the United States, by which she agreed to give them help. She loaned money, sent military stores to the Americans and began making a fleet ready to render still more important aid. It should be stated that French military assistance amounted to little until the closing years of the war. The fear of being shut up in Philadelphia by a French fleet caused the British to withdraw from the city, and to march overland to Sandy Hook, there to embark for New York. Washington followed, and, overtaking them at Monmouth Court House (now Freehold), New Jersey, he fought a sharp battle in a flaming temperature, June 28. The advantage was with the Americans, but the enemy continued their withdrawal to New York. The British were successful in the South, capturing Savannah, and overrunning the colonies there.

Events of 1778.

General Wayne captured Stony Point from the British in July, but a combined French and American attack on Savannah in September failed. In the same month, John Paul Jones fought one of the most terrific sea fights in history, defeating a large force of the enemy and winning imperishable glory for himself.

Events of 1779.

The winter of 1779–80 was unusually severe and stopped military operations for the time. The most notable event was the treason of Benedict Arnold. He agreed for a large bribe to surrender West Point and its valuable stores to the enemy. The shameful crime was defeated by the capture of Major André, the messenger, who (October 2) was hanged as a spy. Arnold escaped to the British lines and afterward died in deep disgrace in England. Although there was much partisan fighting in the South, it remained in the possession of the British.

Events of 1780.

The year 1781 saw the end of the struggle and the achievement of American independence. Disregarding Clinton, who was in New York, expecting and prepared for attack, Washington marched rapidly southward. He was after Cornwallis, the ablest of the British generals, who had formed an intrenched camp at Yorktown on the peninsula between the York and James rivers. A French fleet, more powerful than the English, was approaching the Chesapeake Bay from the West Indies. Its coming was no accident, for it was a part of the grand campaign. The fleet arrived August 30, and the English naval force appeared six days later. The latter was so crippled by an attack that it returned to New York, and the French transports from Newport hurried in with the transports containing the artillery for the siege. On the 28th of September, the allied French and Americans took position before Yorktown. Cornwallis made the best defense possible, but his position was hopeless, and on the 17th of October, he raised the white flag. Two days later, he gave up his sword and surrendered 7,247 English and Hessian soldiers and 840 sailors, including 75 brass and 31 iron cannon. This victory marked the birth of American independence.

Events of 1781.

Surrender of Cornwallis.

No sooner was this momentous surrender completed, than Washington sent a courier, mounted on a fleet horse, to bear the news to Philadelphia, where Congress was in session. The rider frequently changed horses and did not spare himself. As he thundered through the towns and villages, while speeding northward, he shouted the thrilling news, sometimes adding an emphatic expression of opinion, and, it is to be feared, that in some instances, he exaggerated the tidings.

The news in Philadelphia.

It was past midnight several days later, when he dashed into Philadelphia, proclaiming the joyous news with almost every leap of his steed. Windows flew up and heads were thrust out; lights twinkled from all the windows, and people half-clothed swarmed into the streets; then the clangor of bells rang through the city; men danced, embraced one another, flung their hats in air, and sang and shouted over the glorious tidings. The national capital went wild in its happy excitement. Congress met early and solemnly marched to church to give thanks to God for his signal favor. In the midst of the flurry and greetings, the aged doorkeeper tottered and fell to the floor, where he died from excess of joy.

George III. would have continued the war for the conquest of America, had not Parliament forced him to give up the hopeless effort. The preliminary articles of peace were agreed upon, November 30, 1782, and the final treaty, which was the former unchanged, was signed on the 3d of September, 1783, and ratified by both governments. Meanwhile, on the eighth anniversary of the battle of Lexington (April 19, 1783), Washington had officially declared the war at an end. The last British troops evacuated New York, November 25,—an event which has been commemorated ever since in the metropolis of our country. Washington bade farewell to his officers, on December 4, and then set out for Annapolis, where he surrendered his commission and became a private citizen. Human annals do not record a nobler career than that of GEORGE WASHINGTON, whose lofty patriotism, spotless character, military skill, wise statesmanship and unselfish devotion, won the reverential admiration of the civilized world, the undying gratitude of his countrymen, and a fame that shall continue undimmed through the coming ages.

Peace.

III. FORMATION OF NATIONAL GOVERNMENT.

It is true that the United States had won their independence, but in doing so they passed to the very brink of ruin. Commerce, manufactures, trade and industry had been destroyed; the currency was worth no more than the flimsy paper upon which the crude design was stamped; the gaunt, ragged soldiers, who tottered to their desolate homes, had not been paid, even in the miserable currency, for many months; thousands of hearthstones were darkened by the shadow which could never be lifted in this life; the future seemed to offer little or no hope, and anarchy and destruction impended

A critical period.

A common aim and common peril held the States together during the Revolution, and no real authority existed anywhere. All that the Continental Congress could do was to recommend certain specified legislation to the States; the States did as they chose about following the advice and quite often disregarded it altogether. In 1776, each State formed its own government, and on March 1, 1781, adopted the *Articles of Confederation*. These authorized Congress to declare war, make peace, issue money and maintain an army, but that body had no power to levy a single tax or enforce a single law. Any company of men can frame laws without limit, but when they have no means of enforcing them, legislation becomes a farce. The *Articles of Confederation* soon proved to be absolutely worthless.

No strong central authority.

The States were jealous of one another and all dreaded a strong, central government, without which national existence must come to an end. In their desperation some of the States began issuing paper money, as if the mere printing of promises to pay, gave any real value to such slips of paper. Rhode Island prescribed severe penalties for all who refused to accept such stuff in payment of debts. The merchants were defiant, and throughout the summer of 1786 the State was a vast, silent workshop, where all business was dead. Massachusetts, having defeated the proposed paper money law, Daniel Shays, who had been a captain in the Continental army, placed himself at the head of two thousand indignant farmers, dispersed the supreme court sitting at Springfield, attacked the arsenal, and demanded the abolishment of taxes and a general issuance of paper money. Congress sent a strong military force to the disaffected section, and the revolt was suppressed after slight bloodshed.

Shays's Rebellion.

These and other acts of disorder roused the thoughtful people of the country to the gravity of the danger which threatened the national existence. Washington, Franklin, Hamilton, Jefferson and other able patriots gave many anxious hours to a consideration of the great problem. Virginia, in January, 1786, had invited commissioners from all the States to meet at Annapolis in September to consider the necessary legislation regarding trade. Only five States sent commissioners. They, however, adopted an address, urging all the States to name new commissioners to meet in Philadelphia in the following May, to consider, not only the commercial situation, but to "devise such further provisions as shall appear to them necessary to render the constitution of the federal government adequate to the exigencies of the Union."

The Annapolis convention.

It was a notable body of men that came together in the same room in Independence Hall, where the immortal Declaration of Independence had been signed. Washington was the presiding officer, and among the members were Franklin, Madison, Randolph, Robert Morris, the financier of the Revolution, Gouverneur Morris, author of our decimal coinage, and others of great ability. The masterful personality of Washington did more than anything else to bring the deliberations of the convention to a successful issue. There was seemingly no end to the conflicting views, and time and again the convention was on the eve of hopeless adjournment. But, slowly and carefully the great work was forged into definite form, and at the end of four months, was evolved the CONSTITUTION OF THE UNITED STATES, one of the wisest and most statesmanlike systems of government ever framed by the wisdom of man.

The constitutional convention.

Twelve states were represented in the Constitutional Convention of 1787, Rhode Island being the only one that refused to send delegates. The Constitution was signed September 17, 1787, with the provision that it should go into effect March 4, 1789, if ratified by nine States. The following is the order of such ratification:

Ratification of the Constitution.

1787.	Delaware, December 7.
	Pennsylvania, December 12.
	New Jersey, December 18.
1788.	Georgia, January 2.
	Connecticut, January 9.
	Massachusetts, February 6.
	Maryland, April 28.
	South Carolina, May 23.
	New Hampshire, June 21.
	Virginia, June 26.
	New York, July 26.
1789.	North Carolina, November 21.
1790.	Rhode Island, May 29.

The Constitution divides our government into three branches,—legislative, judicial and executive. The first is Congress, composed of the Senate and House of Representatives, which makes the various laws governing the United States. One would naturally suppose that the members of Congress should be based upon the population of the respective States, but this would work a grievous injustice to the States with sparse populations; they would be virtually helpless in the way of legislation as against the more populous ones. As a check to such a wrong, the Constitution provides that every State shall be represented in the United States Senate by two Senators, chosen by the respective State legislatures, for a term of six years. Thus Nevada has the same representation in the Senate as New York whose

The legislative branch of government.

population is one hundred and seventy times as great. Still the population of each State should have a distinctive representative value in Congress, and it is provided that the members of the House of Representatives—chosen every two years by popular vote—shall be based upon the population of the different States. For this reason, while Nevada is entitled to only three electoral votes, New York has thirty-six. No more equitable system could be provided. The Senate represents the States; the House of Representatives, the people.

Slave representation.

Although the slaves were not citizens, the South insisted that they should be counted in the Congressional representation. The North opposed, but a compromise was effected by which three-fifths of the slaves were represented. Another compromise was a shameful one: the African slave trade was authorized until 1808. Truth compels the statement that while New England favored this immoral bargain, the leading Virginians opposed it.

The judicial and executive branches.

The judicial branch of the government is vested in a Supreme Court and in such inferior courts as Congress may from time to time establish. The executive power resides in the President, whose term is four years. He is chosen by electors, each State being entitled to the same number of electors as its Senators and Representatives in Congress. Congress makes the laws, the Supreme Court decides their constitutionality, and the President enforces them.

Powers of Congress.

The government of each state is modeled on that of the United States, but Congress alone has the power to form treaties, coin money, lay duties on imports or exports, make war or peace, provide for the raising and supporting of armies and a navy, regulate commerce with foreign nations and among the several States, establish post-offices, punish piracy and counterfeiting, call out the militia to suppress insurrections, grant copyrights and patents, and govern the District of Columbia, in which is situate the capital of the United States. The Constitution should be carefully studied by every youth and adult in the country.

The Northwestern Territory.

Before the old Continental Congress passed away it performed one of the most important acts in the history of our country. This was the passage in July, 1787, of an ordinance, organizing the Northwestern Territory, from which the States of Ohio, Indiana, Michigan, Wisconsin and Illinois were afterward formed. The ordinance encouraged schools, guaranteed freedom of conscience, and shut out slavery and involuntary servitude, except for the punishment of crimes.

One of the strange difficulties which confronted Congress at the close of the Revolution was the division of this immense region, which was claimed by several States. In some of the original grants, the western boundaries were clearly defined, but in the case of others, they were not. Six of the States were supposed to extend to the Pacific, but in 1763, the Mississippi became the extreme boundary in that direction. The disputes became irreconcilable and, as the only way out of the tangle, all the States in the controversy ceded their claims to the United States. The result was the formation of the western boundaries of New York, Virginia, Massachusetts, Connecticut, South Carolina, North Carolina and Georgia, as they are at the present time.

Settlement of the Northwest.

A stream of navigation set in toward the Northwest Territory, for the lands were fertile and inviting, a governor had been appointed and 17,000,000 acres of land had been purchased from the Indians and thrown open to settlement. Most of the pioneers floated down the Ohio in flatboats to their destination, and villages and towns rapidly sprang into existence. The flourishing city of Marietta was begun in 1788, and Losantiville afterward grew into the metropolis of Cincinnati. For years there was more or less trouble with the Indians, who, in many cases, fiercely resisted the inroads of the white people. Hundreds of settlers fell before the tomahawk and rifle ere peace came to the harried frontier.

First Presidential election.

It was provided that when nine States had ratified the Constitution, it should go into effect. This took place in time for the Presidential election to be held in 1789. North Carolina and Rhode Island were too late to take part and New York failed to pass a law providing for the mode of choosing electors. As a consequence, only ten States took part in the first Presidential election. Of the sixty-nine electoral votes cast, George Washington received every one for President, while those for Vice-President were: John Adams, of Massachusetts, 34; John Jay, of New York, 9; R. H. Harrison, of Maryland, 6; John Rutledge, of South Carolina, 6; John Hancock, of Massachusetts, 4; George Clinton, of New York, 3; Samuel Huntingdon, of Connecticut, 2; John Milton, of Georgia, 2; James Armstrong, of Georgia, Benjamin Lincoln, of Massachusetts, and Edward Telfair, of Georgia, one vote each. Four votes were not cast. John Adams, therefore, became Vice-President. At that time, a majority of votes was necessary to elect a President, but it was not required in the case of a Vice-President. The two consequently might belong to different political parties. This law was changed in 1804, by a constitutional amendment. The time for the counting of the electoral votes by Congress was fixed for the first Wednesday in March, which, in 1789, was on the 4th. This has remained the date of each Presidential inauguration, except when it falls on Sunday. In that case, the 5th of March becomes the important day.

Washington's journey to New York.

The city of New York was chosen for the meeting place of Congress, but no quorum appeared until the 6th of April. Washington loved the life of a gentleman farmer at Mount Vernon, and when he returned to his estate, at the close of the Revolution, it was with the hope that he would be permitted to spend the remainder of his days there; but he was too exalted a patriot to disregard the call of his country. He left his home, April 16, and reached New York a week later. He was welcomed at every stage of his journey by joyous shouts, songs and honors. Men, women and children united to do reverence to the foremost American, whose eyes repeatedly filled with tears at these proofs of the universal love in which he was held. He was indeed the Father of his Country, "First in peace, first in war, and first in the hearts of his countrymen."

The inauguration of Washington took place April 30, in Federal Hall, on the site of the present subtreasury building. An immense multitude cheered the great man, when in full view of them, the oath was administered by Chancellor Robert R. Livingston, of New York. The wisest of men needs counsellors, and Washington lost no time in choosing his cabinet. The names confirmed by the Senate were: Thomas Jefferson (he would have been chosen Vice-President had he not been a Virginian, like Washington), Secretary of Foreign Affairs (afterward changed to Secretary of State); Alexander Hamilton, Secretary of the Treasury; Henry Knox, Secretary of War; and Edmund Randolph, Attorney-General. Washington also nominated John Jay as Chief Justice of the Supreme Court, and John Rutledge, James Wilson, William Cushing, Robert H. Harrison, and John Blair associates. All were confirmed except Rutledge.

The first cabinet.

A gigantic task confronted the first administration, for it was necessary to set the complicated machinery in motion and provide immediate cure for the ills of the country. The most urgent need was the financial one. The United States was bankrupt and unable to borrow money anywhere. Providentially, Washington had chosen the ablest financier of his time as his Secretary of the Treasury. Alexander Hamilton was not only honest to the core, but he was wise and far-seeing beyond most men. He set out with the self-evident

The wise measures of Alexander Hamilton.

truth that it is the moral duty of every nation, as it is of every individual, to pay its debts. His first proposition, therefore, was to pay every dollar of the foreign and domestic obligations of the government with interest. It was a herculean task, but Congress agreed to it.

The next proposition of Hamilton staggered Congress and alarmed many, for it was that the Federal government should assume the debts of all the States. Jefferson led the opposition, which was so powerful that a concession had to be made regarding the location of the national capital. The South were eager that it should be in their section. It was agreed that it should remain in the city of New York until 1790, then be transferred to Philadelphia, and thence in 1800 to Washington on the Potomac.

The potent objection to this assumption of the State debts, as well as the establishment of a national bank, was that it would give too great power to the Federal government, which would thus be strengthened at the expense of the different States. The opposition to Hamilton's policy came from the North as well as the South. Hamilton, as has been stated, won in the end, but the debates in Congress were persistent and earnest, and resulted in the formation of the Federal and Republican parties. The Federalists, whose leaders were Washington, Hamilton, Madison and Adams, favored giving to the national government all the authority and powers permitted by the Constitution; the Republicans held that all such powers, unless specifically accorded to the government by the Constitution, should inhere in the respective States. Thomas Jefferson was the foremost Republican of his day.

Federalists and Republicans.

Congress, upon the recommendation of Hamilton, passed an important act in February, 1792. It provided that while the material from which goods were made should not be taxed, the importation of the goods which competed with those manufactured in this country should be prohibited. This was the first protective tariff. As we know, the questions of free trade, high protection, and tariff for revenue only, have occupied, more or less, the attention of Congress from that time to the present, as it is sure to engage its attention for an indefinite time to come.

A protective tariff.

Mention has been made of the stream of emigration which flowed westward, and of the troubles with the Indians. The outrages became so numerous, that General Harmar was sent with a considerable force to punish the red men, but was defeated (October, 1790). President Washington then despatched General Arthur St. Clair, the first governor of the Northwest Territory, and an officer of the Revolution to chastise the red men. Washington understood Indian warfare perfectly, and warned St. Clair against being ambuscaded. Yet that officer led his men into an ambush and was routed with dreadful slaughter (November, 1791). The news filled Washington with a tempestuous rage — a very rare occurrence with him — but when the storm passed, he declared, with his usual magnanimity, that perhaps he was unjust, and he would not condemn St. Clair until he had heard his explanation. The President, however, made no mistake, when he sent General "Mad Anthony" Wayne to the West. That skilful and daring leader crushed so completely the combined Indians at Fallen Timber, in August, 1794, that they did not rally for years. Over a thousand chiefs and warriors met the United States commissioners at Fort Greenville, some months later, and signed a treaty of peace and gave up their rights to a large territory, now forming a part of Indiana and Michigan.

Indian troubles.

The Constitution requires that a census of the United States shall be taken every ten years. The first enumeration was in 1790. This showed that the total population was 3,929,214. Virginia had the greatest, with 747,610; Pennsylvania, with 434,373, ranked next; North Carolina, with 393,751, third, while Tennessee, with 35,691, stood at the foot of the list. In 1800, Virginia was still in the lead and the total population had risen to 5,308,483.

First census of the United States.

Washington longed to retire to private life, but his countrymen would not permit, and he was chosen unanimously for a second term, while John Adams once more became Vice-President. By this time, party differences were strongly defined. Hamilton was the leader of the Federalists and Jefferson of the Republicans, and it often required all the tact and sternness of Washington to prevent an open rupture between these two brilliant members of his cabinet. It has been said of Washington that in him were displayed the sanity of genuis and the genius of sanity. He was always cool, thoughtful and calm in his judgments, of matchless poise and of perfect self-control. The greatest of his contemporaries were sometimes betrayed into impulsive acts or words, but it was never so with the Father of his Country. The "Citizen Genet" incident was an instance of his clear sense and intuitive perception of the right thing to do. France was plunged into the bloodiest revolution of modern times during the closing years of the eighteenth century. The Federalists as a whole sympathized with England in 1793, when she and France went to war, because England represented law and order, but the Republicans favored the revolutionists in France, until their excesses appalled the civilized world. It was natural that the "democrats" of that country should expect the aid of the United States against England, not only because of the help given to us during the Revolution by France, but because of the similar aims and aspirations of the two peoples. In 1793, the French democrats sent "Citizen Genet" (all titles being abolished) as their minister to this country.

Second Presidential election.

The "Citizen Genet" incident.

The insolence of this man approached the sublime. His first grossly discourteous act, after landing at Charleston, S. C., was to fail to present his credentials to our government. He began enlisting recruits and fitting out privateers to serve against England. This was a flagrant breach of neutrality, and many prominent Americans, who knew better and ought to have been ashamed of themselves, encouraged Genet in his high-handed course. Even Jefferson sympathized with him at first, but soon resented his unpardonable impudence. Washington sternly quenched the marplot, and gave his government to understand that he was *persona non grata*. France cancelled his commission and ordered him to return home. Genet knew that if he obeyed, the guillotine awaited him, so he stayed in this country, married an excellent lady, became a respectable citizen and lived to old age.

The first State admitted into the Union was Vermont, March 4, 1791. The name signifies "green mountains," and the region was first visited by Champlain in 1609. It was settled by emigrants from Massachusetts. New Hampshire and New York claimed the territory, and the king decided in favor of the latter. Kentucky came into the Union, June 1, 1792. It was originally a part of Virginia, and was organized into a Territory in 1790. The name is of Indian origin, but does not have the meaning of "dark and bloody ground," so often given to it. The famous pioneer Daniel Boone settled in Kentucky in 1769, and the section was the scene of many encounters between the red men and the whites. Tennessee became a State, June 1, 1796. A short time before the Revolution, a number of defeated "Regulators" passed from North Carolina and settled on the Watauga and Holston rivers, where under the lead of John Sevier and James Robertson, and with a community mostly of Scotch-Irish stock, an independent commonwealth was formed. The first representative sent to Congress by Tennessee was Andrew Jackson.

Admission of new States.

There was so much friction, owing to a variety of causes between England and the United States, that Chief Justice Jay was sent to London to negotiate a treaty. This was signed in November, 1794, but

the public did not learn of its provisions until it had been ratified by the Senate more than six months later. It provided for the payment of debts in dispute to British creditors, and of indemnity for illegal captures of American ships. The ports of this country were opened to British ships in return for privileges in the British West Indies of slight value to us; no compensation was provided for slaves taken out of the country by the British during the Revolution, nor was England bound to stop the impressment of seamen from American ships. When the terms of this treaty became known, a storm of indignation swept over the country at what was considered a cowardly surrender to England. Jay was burned in effigy, and several of the Federal leaders assaulted, but, as passion cooled, and a calm review of all the circumstances was had, it was seen that although the treaty failed to accomplish what was desired, it was an important step in the right direction, and reflected credit upon the author.

The Jay Treaty.

IV. Social Life and Customs.

We have traced the history of our country from its discovery and colonization to the establishment of a national government. Through hardships, trials and self-sacrifice, we have seen it planted upon a foundation of rock, and have noted the principal events of the administrations of Washington, the first President,—the peerless pilot who guided the ship of state through the breakers which threatened its destruction. The peace that succeeds war is often more dangerous to a people than war itself, but the immortal Father of his Country was no less great as a statesman than as a warrior. His matchless poise, his unerring judgment, his far-seeing sagacity, his prevision, which saw with marvelous clearness into the future, his lofty patriotism, and whole-souled devotion to the highest interests of his countrymen, proved that he was the instrument chosen by heaven to create and launch the greatest nation in history.

The work of Washington.

It is well before tracing the historical events of the United States to the present time that we should study the social characteristics of our ancestors. No study can be more interesting and instructive, for, lacking such knowledge, none can understand our real history. During the colonial period the thirteen colonies crystallized into what may be termed three divisions,—New England, the South, and the middle section originally settled, with the exception of Pennsylvania, by the Dutch. Each had its distinct features, as manifested in the industries and social life of the people themselves.

The three colonial divisions.

We know that the New England pioneers were sturdy, robust, God-fearing people, who, having left the mother country to escape religious persecution, faced all possible sufferings unflinchingly. We cannot help believing that when many died from disease, starvation, or by the tomahawk of the vengeful red man, the survivors felt a pang of homesickness, and sighed for the old days, beyond the stormy ocean, where, if they were scorned and spat upon, they had food, clothing and comparative safety. But never was a murmur heard, nor did any stricken father or mother speak of going back to England. They grimly held fast, ready to lie down and die in the dismal wilderness, if need be, were it the will of God.

Heroic endurance of the New England pioneers.

Such pioneers cannot fail of success, as history proves, but their training makes them austere and harsh. Unalterable in their conviction that they and only they were right, they extended little or none of that sweet charity to others which is the foundation of the Christian religion. They drove Roger Williams away, banished Anne Hutchinson, persecuted the Quakers, would not tolerate the Catholics, and among the score whom they slew on the charge of witchcraft, was one miserable victim who suffered the penalty of being crushed to death. When one of the governors came upon a party of children, having a merry time around a May-pole, he angrily beat the ground with his cane, ordered them to their homes to meditate upon the sin of their frivolity, and lost no time in having the pole chopped down. Human nature, however, has always been the same, and such senseless severity does no good but much harm. It need hardly be said that novel-reading, dancing, and dramatic entertainments were looked upon as sins that were almost unpardonable.

Their uncharitableness.

The earliest houses were small cabins of logs, made to resist attacks by Indians. Oiled paper was used in the windows, because glass was costly. The interior generally consisted of two or three rooms, the upper being open, so as to receive the warmth from below, and was reached by a sloping ladder. The fireplace occupied all or the greater part of one side of the lower story, and the roaring blaze sent four-fifths of the heat up the chimney. This fire was made to do all the cooking and baking for the family. For a long time, no carpet was seen, and in many cases the floor was the cold earth, worn smooth by the incessant tramping of feet. The furniture was scant and consisted of a few stools, chairs and a bench or two. The latch of the door was raised from the outside by means of a leathern string, passing through a hole over the latch. To lock the door at night, the latch string was drawn in. Even now, when a man wishes to tell a friend he is welcome as a visitor, he sometimes says: "You will find my latchstring outside." Forks at first were not used and blocks of wood often served for plates. Pewter plates appeared after a time, and were scrubbed so bright that they served for mirrors. Many boys and girls learned the alphabet from the letters stamped around the rim of their plates. Coffee and tea gradually came into use, and nearly every family brewed its own beer. Hard cider and rum were common and there was no objection to a church member drinking all he wished, so long as he did not became intoxicated.

The houses.

Until well into the nineteenth century, the men's trousers ended at the knee. The rich wore silk stockings, velvet trousers, and ornamented their shoes with gold or silver buckles, as they did their knees. The long coats of the wealthy were of brilliant color, and were ornamented with gold lace; the caps were of silk or velvet and broad-brimmed; the cloak of red, and the wigs were powdered or bleached. Perfumes were more popular than they are to-day. There was little or no difference between the costumes of the boys and girls and that of their parents.

The dress.

Little money was seen, business being mostly done by barter. Massachusetts, beginning in 1652, was the only colony for a long time to coin money. Because of the emblem of a pine tree on the die, the pieces were known as pine-tree sixpences, shillings, etc. As a matter of economy, the same date was stamped upon the coins for thirty years.

The currency.

Steamboats did not come into use until the nineteenth century was well advanced, and locomotives appeared still later. For short distances, the people walked or rode on horseback. The bridges were few and streams were forded or ferried. Communication along the coast was by means of sloops and vessels. When the wind was favorable, the voyage between New York and Philadelphia was made in two or three days. The well-to-do had their lumbering chaises and big-wheeled gigs.

Methods of travel.

We have already referred to the religious strictness of the Puritans. Attendance on divine service was compulsory, and the minister was supreme. None dared gainsay him, and a "church reproof" was dreaded above all things. Profanity was punished by standing the offender in a public place, with his tongue held as if in a vise by a cleft stick. If his offense was especially heinous, he was fined, imprisoned or set in the stocks.

Modes of punishment.

The woman convicted of being a scold was gagged and publicly exposed in front of her own home. If that did not cure her, she was ducked, by which time she was sure to be ready to place a check upon her unruly member.

The meeting-houses were small barns, without carpets, instrumental music or fire, even in midwinter. An invalid woman was allowed to bring a warming pan for her feet. The introduction of a stove split more than one congregation asunder. Men and women sat apart, and the boys were placed in the galleries or on the pulpit stairs. The sermon was an hour and often more in length, and the constable or tithing man kept a sharp lookout for nodding heads. If a man or boy became drowsy, he was roused by a smart tap from the end of a stick in the hands of the mentor. If the drowsy one was a woman, the stick was reversed, and the downy tail of a rabbit tied thereto was softly passed over her forehead. The flint and steel were used to start a fire, the lucifer match being an invention of the nineteenth century, which also saw the introduction of Sunday Schools.

At Church.

The people of New England were mainly agriculturists, but they sent large quantities of salted fish, lumber and furs to England, in exchange for such articles as they needed. Ship-building and coast trade soon grew into important industries. As might be supposed, the New Englanders did not neglect the interests of education. We have learned of the founding of Harvard College in 1636. The Public Latin School had been opened the year previous in Boston, and other public schools rapidly followed. An all-important step was taken in 1647, when the general court ordered that in every township containing fifty householders a school-teacher should be appointed to instruct "all such children as shall resort to him to write and read."

Education.

The Dutch of New York in their thrift, tidiness and morality resembled the New Englanders, but they were more easy-going in their ways and fonder of the good things of life. They welcomed all creeds and were contented, law-abiding, peaceful and happy. The traffic in furs first drew the Hollanders to the New World, and for years the trade was very profitable. After a time, agriculture received attention. This was chiefly due to the action of the New Netherland Company, which promised an estate of sixteen miles frontage on the Hudson to every member who brought fifty permanent settlers into the province. The owners of these extensive estates were called "patroons," and were given manorial privileges, which afterward caused the "Anti-renters" war, marked by violence and bloodshed. The first public school was established in New Amsterdam in 1633.

The Dutch.

While New England was settled mainly by Englishmen fleeing from religious persecution, the major portion of the Virginian pioneers, or Cavaliers, belonged to the Church of England, and were members of the sect that persecuted the Independents and Puritans. A large number came to Virginia after the execution of Charles I. and the establishment of the Commonwealth. They were brave, chivalrous and hospitable, fond of horse-racing, cock-fighting, and the amusements which were looked upon with horror in New England. Every stranger was welcomed by the planter to whom he presented himself, and treated as a gentleman, so long as he proved himself one. Indeed, in the olden times, the planter sent out his servants to bring in such travelers as were passing through the neighborhood, and his home was at their disposal, no matter how long they chose to remain. This spirit of hospitality remains one of the most pleasing traits of the southerners of to-day.

The South.

There were no manufactures in the South until a comparatively recent period. The men of means were planters, whose work was done by slaves. Climate and soil were favorable to the production of sugar, cotton and tobacco, and slavery, which existed at first in all the colonies, finally became a structural part of society in the South. The efforts of England to suppress all manufactures in the colonies incited the people to greater efforts, so that, when the Revolution came, New England and some sections of the middle colonies were able to provide their own clothing. This, it must be noted, was not true of the South, where, as has been stated, no manufactures existed.

At the opening of the Revolution it is estimated that the number of slaves in Virginia was 165,000; in South Carolina, 110,000; in Maryland, 80,000; in North Carolina, 75,000; in Georgia, 16,000; in New York, 15,000; in Pennsylvania, 10,000; in Delaware 9,000; in New Jersey, 7,600, with 13,400 distributed through New England. Virginia would have stopped the slave trade in 1769 had she not been forbidden by royal authority. Rhode Island, Massachusetts and other northern colonies took a leading part in the shocking traffic, and the crime of human slavery therefore rests upon the North as well as the South.

Slavery.

V. Growth and Progress.

Shortly after the States had organized under the Constitution, a number of amendments were found necessary. The first ten of these were declared in force, December 15, 1791. These guaranteed religious freedom, liberty of the press, and the right of petition; the right of each State to maintain a militia; forbade the quartering of soldiers upon any house without the consent of the owner, and unreasonable searches; gave protection in the case of capital crimes; the right of speedy trial; of trial by jury; prohibited excessive bail, fines and unusual punishments; declared that the enumeration of Constitutional rights shall not exclude others retained by the people; and reserved to the States all the rights not delegated to the United States by the Constitution, and not prohibited by it to the States. The eleventh amendment, regarding the judicial power of the United States, became operative January 8, 1798. The twelfth amendment, regulating elections, assumed force, September 28, 1804. The remaining three amendments were ratified after the close of the Civil War.

Amendments to the Constitution.

Hamilton's favorite scheme of a national bank went into effect, in 1791, the Bank of the United States having been chartered for twenty years. Its capital was $10,000,000, one-fifth being owned by the government. The faith of the people in the stability of the government was proved by their eagerness in subscribing for the remainder of the capital. It would have been quickly taken had it been five times as great. The bank was located in Philadelphia and opened branches in the principal cities. It was to retain the public revenues and help in making governmental payments. A mint was ordered to be established, also in Philadelphia (where it is still located), and coinage began in 1792. All that the owner of gold, silver or copper, in any form, had to do was to bring the metal to the mint, which turned it into money without cost to him. This constituted "free coinage."

Establishment of a national bank and mint.

Free coinage.

No man can ever retain or gain the confidence of the American people to the extent of George Washington. Had he been willing, he would have been President to the close of his life, even had that been extended to fourscore. He was urged to accept the office for a third term, but he insisted upon the right he had fully earned. He felt the weight of increasing years and longed for his tranquil home at Mount Vernon. Thither he went, at the close of his second term, followed by the loving gratitude and prayers of his people, and there he quietly breathed his last, December 14, 1799. It may be truly said that he was mourned by the whole nation. All possible honors were paid to him, and his remains were

Washington's retirement and death.

placed in their present receptacle at Mount Vernon, in 1837.

As evidence of the warmth of the Presidential contest of 1796, we give the full electoral vote: John Adams, Federalist, 71; Thomas Jefferson, Republican, 68; Thomas Pinckney, Federalist, 59; Aaron Burr, Republican, 30; Samuel Adams, Republican, 15; Oliver Ellsworth, Independent, 11; George Clinton, Republican, 7; John Jay, Federalist, 5; James Iredell, Federalist, 3; George Washington, John Henry, and S. Johnson, Federalists, 2 votes each, and Charles C. Pinckney, Federalist, 1 vote. It will be noted that the result, already named as probable, took place in the election of 1796; the President and Vice-President belonged to different political parties.

Presidential election of 1796.

John Adams, the second President, was born in Massachusetts in 1735, was a graduate of Harvard College, a lawyer and one of the most influential and industrious members of the first and second Continental Congresses. He was a devout Christian, but afflicted with an impatient temper. He died at the age of ninety, surpassing in that respect all other Presidents. A remarkable fact was that his death occurred July 4, 1826, just a half century after the signing of the Declaration of Independence, with whose adoption he had more to do than any other man.

The second President.

The cloud that darkened the administration of Adams was war with France. That country had been turned topsy-turvy by the appalling revolution and reign of terror, and felt resentful toward the United States because we refused to help her in her war with England. When Charles C. Pinckney was sent thither as our minister, the republic not only refused to receive him, but ordered him to leave the country. Then the French cruisers began preying upon our commerce. President Adams received news of this outrageous action in the same month that he was inaugurated, and called Congress together to decide upon the course of the government. The assaults upon our shipping became so exasperating that a general clamor for war arose; but the President and the prominent leaders in Congress remained calm, for none knew better than they the national weakness and unpreparedness for war with a leading power. Congress authorized the appointment of John Marshall and Elbridge Gerry to be associated with Pinckney on his return to France, in the effort to bring about a reconciliation with that hot-headed people.

Threatened war with France.

It is proper to record that the French marine, in their attempts to destroy our commerce, received several humiliating lessons. The 38-gun frigate, *Constellation*, Captain Thomas Truxtun, was attacked by the 38-gun frigate, *L'Insurgente*, in the Caribbean Sea, in February, 1799. The result was the capture of the French frigate. The same American commander, after a fierce battle with the 54-gun frigate, *La Vengeance*, compelled her to strike her flag.

Hostilities on the ocean.

When our envoys reached France, they were informed that no negotiation could be considered until a large money gift had been made to Talleyrand, to be divided by him among the members of the Directory, then constituting the government of France, in addition to which our government would have to loan several millions to that country. To this intolerable insult, Pinckney made the reply which has been quoted many times since: "Millions for defence, but not one cent for tribute!" The report of these proceedings added flames to the war spirit in the United States, and President Adams, despite his well-known peace sentiments, was forced to begin vigorous preparations for hostilities. Commercial intercourse with France was stopped, and he was authorized to detach 80,000 men from the militia and to organize a naval department. A messenger was despatched to Mount Vernon, with a commission to Washington as commander-in-chief. Washington was found superintending work on his estate, and when the paper was handed to him, he adjusted his spectacles and carefully read it. He replied that, though he was an old man, he was ever ready to serve his country in every way possible.

"Millions for defence, but not one cent for tribute."

War preparations.

The period will be recognized as marking the meteoric career of that marvelous military genius, Napoleon Bonaparte. He found himself arrayed against the armed coalition of all Europe, and with enough on his hands without engaging in a struggle with the lusty young republic on the other side of the ocean. To him was due a satisfactory treaty between his country and the United States made in 1800.

Peace.

The Federalists had favored the war, and borne down the opposition of the Republicans. The former now proceeded to unconstitutional lengths by passing, in 1798, the Alien and Sedition Laws. The first extended the period of naturalization to fourteen years, and authorized the President to expel any foreigner whom he thought dangerous to the public peace and safety. This power was never used, but the passage of the law caused general alarm. The Sedition Act was still more unpopular, for it was a blow at the liberty of the press and suggests the offense of "*lese Majestie*," which is in force to-day in Germany. It was made a crime to conspire in opposition to any measure of the government directed by proper authority, or to utter or publish "any false, scandalous, and malicious writing or writings against the government of the United States, or the President." There were several prosecutions under this law, which was bitterly denounced in every part of the country. Vice-President Jefferson dictated a series of resolutions, sent to the various State legislatures, and adopted by Kentucky, which declared the States absolved from obedience to Congressional enactments, when, as in this instance, they were not authorized by the Constitution. Similar resolutions, written by Madison, were adopted by Virginia, though the authorship of neither set was publicly known until several years later.

The Alien and Sedition Laws.

The Alien and Sedition Laws were fatal to the Federal party. In 1800, Thomas Jefferson and Aaron Burr, Republicans, received 73 votes each; John Adams, Federalist, 65; Charles C. Pinckney, Federalist, 64; John Jay, Federalist, 1 vote. Jefferson and Burr, being tied, the choice devolved upon the House of Representatives. There the contest was prolonged, but on the thirty-sixth ballot, Jefferson received the votes of ten States, which was the largest vote cast, while four States supported Burr, who became Vice-President. The twelfth amendment to the Constitution, declared in force September 28, 1804, required each of the electors to vote for a President and Vice-President. Thus the two officers always belong to the same political party.

Presidential election of 1800.

Although defeated in the representative and executive branches of the government, the Federalists retained a great man in the judiciary, in the person of John Marshall, as Chief Justice. He was a native of Virginia, and served when hardly out of his teens, as a soldier in the Revolution. He carried the Virginia convention with him in ratifying the Constitution in 1788, served as Congressman, and was Secretary of State in 1800–01, when President Adams appointed him Chief Justice of the Supreme Court, which office he held until 1835. He was the most profound of American jurists, and did more than any man before or since in "interpreting" the Constitution.

Chief Justice Marshall.

Thomas Jefferson was born in Albemarle County, Virginia, in 1743, and was graduated from William and Mary College, the second institution of its kind established in this country (1692). He early displayed marked ability, and served his country in Congress, in the Virginia legislature, as minister to France, as Secretary of State and as Vice-President, before his election to the Presidency. To him belongs the immortal honor of having been the author of the Declaration of Inde-

The third President.

pendence. He was the foremost Republican of his time, and is universally accepted as the founder of the Democratic party, which succeeded to the title first used. When Jefferson, like John Adams, died on the fiftieth anniversary of American independence, the coincidence was so wonderful that many saw a sacred significance in the event.

It will be remembered that the Federal government was removed to Washington in 1800. Jefferson was therefore the first President to be inaugurated in that city. He was the first also to adopt the present practice of sending his message to Congress, instead of appearing in person to read it. Jefferson was a learned scholar, the master of several languages, a splendid marksman and horseman, an excellent violinist, an inventor and no mean scientist. His manual for the government of the Senate is still an authority. He aided in creating our decimal currency, and was prouder of being the founder of the University of Virginia than of having written the Declaration of Independence. Though his Kentucky resolutions justified nullification, his declaration in 1784, that our government has the power and right to prohibit African slavery in all the national territory not formed into States, was the doctrine upon which the present Republican party was founded, seventy years later.

The most important measure connected with Jefferson's administrations, was the Louisiana Purchase. This region was far more extensive than the State which now bears that name, for it embraced all the territory between the Mississippi and the Rocky Mountains, and reaching from British America to Texas. Its exact area was 875,025 square miles, which is greater than that of the sixteen States, that composed the Union at the time of the purchase. This territory, as we remember, was ceded to France in 1801 by Spain, which had acquired it at the conclusion of the French and Indian War, in 1763. Napoleon had in mind the old scheme of founding a grand empire in the Mississippi valley, with the control of that mighty river to the Gulf of Mexico; but he saw, that, in a war with England, the region would become an element of weakness rather than strength. Moreover, Napoleon was notified that the United States would never permit the ownership of the Mississippi to pass to France. Before doing so, our country would make an alliance with England, with whom the continent would be shared. In these circumstances, Napoleon willingly sold Louisiana to the United States, April 30, 1803, for the sum of $15,000,000.

The Louisiana Purchase.

So little was known of the enormous region, that Congress, upon the recommendation of President Jefferson, made an appropriation for sending an exploring expedition thither. It was placed under the command of two young Virginians, Captains Meriwether Lewis and William Clark, and left St. Louis, May 14, 1804. The explorers ascended the Missouri to the Rocky Mountains, crossed them, and then passed down the Columbia to the Pacific. After an absence of two and a half years, the expedition returned to civilization, bringing valuable and interesting information of the country, from which have since been formed the States of Louisiana, Arkansas, Missouri, Iowa, Nebraska, Kansas, Montana, Wyoming, North and South Dakota, and portions of Minnesota and Colorado, the Indian Territory and Oklahoma.

The Lewis and Clark Expedition.

This expedition gave us a good claim to the territory consisting now of the States of Oregon and Washington. Captain Robert Gray of Boston discovered the Columbia in 1792, and a trading post was established at the mouth of the river, in 1811, by John Jacob Astor of New York.

It has been said that politics make strange bedfellows, and not the least interesting part of this prodigious purchase of real estate was the shifting of views on the part of the political leaders of the country. Jefferson was a strict constructionist, and admitted that the Constitution gave him no authority for buying territory, but he thought such an amendment should be made. He was warned that France was likely to withdraw the offer before the amendment could be secured. Still, insisting that he was doing a technically unwarranted thing, Jefferson yielded, because of the measureless advantage that would accrue to his country.

Hamilton was about the only leading Federalist who approved the act. To be consistent, all his party should have supported it. Their chief strength lay in New England, and there they fought the project to the end, for they saw that with the expansion of the Union westward, their prestige and influence would diminish if not wholly pass away. They maintained that the assent of every State was necessary to the acquisition of new territory, and threatened secession, if the purchase was carried out. Nevertheless, the transaction was completed and the necessary legislation secured. The present State of Louisiana was organized as the "Territory of New Orleans," the rest of the domain forming the "District of Louisiana." It was first joined, for the purposes of government, to the Territory of Indiana, then made the "Territory of Louisiana," and finally, in 1812, became the "Territory of Missouri."

Divergent views regarding the Louisiana purchase.

It seems hardly necessary to say that one of the first acts of Jefferson's administrations was the repeal of the obnoxious Sedition Act, while the Alien Law was so modified as to reduce the term of naturalization to five years.

Repeal of the Sedition Act.

At the opening of the nineteenth century, the United States contained nearly five and a half millions of people. Mason and Dixon Line (so called because two surveyors, Charles Mason and Jeremiah Dixon ran the boundary line between Maryland and Pennsylvania in 1763–67) was accepted in time as the dividing line between the North and South. To the north of this line were 2,600,000 white people, with 4,000 less blacks than in 1790; to the south were 1,700,000 whites and 200,000 more slaves than ten years previous. Pennsylvania was the most prosperous State and Philadelphia the largest city. The Mississippi Territory was formed in 1798, in the southwest, embracing the region claimed by Georgia.

Distribution of population in 1800.

The Americans are the most inventive people in the world as is proved by the fact that three-quarters of a million patents have been granted in this country since 1837. The first American patent was taken out in 1790. Modifications were made in the law in 1793. Down to 1836, the issuance of a patent did not guarantee its novelty: that had to be established in the courts. The defect was remedied in the year last named.

Invention.

One of the greatest industrial inventions ever made was the cotton-gin ("*gin*," abbreviation of "engine"). It was the work of Eli Whitney, a New England school-teacher, living in Georgia. The separation of cotton from the fibre was so expensive and tedious, that the culture was insignificant. No cotton was exported in 1790. Three years later, Whitney produced his invention which did the work of a thousand slaves, and made the raising of cotton the leading industry of the South. A half century after the invention of the cotton-gin, we exported nearly two and a half million bales, each bale averaging 487 pounds. This has grown five-fold. The enormous increase in the value of slave labor smothered the sentiment in favor of emancipation that had been growing in the northern slave States. It is probable that, but for the invention of the cotton-gin, there never would have been any war for the Union, for the South would not have been rich enough to enter upon the stupendous struggle.

The cotton-gin.

It will be a blessed day, when arbitration shall take the place of war and nations shall cease trying to destroy one another. We should all pray and strive for the time when it may be said:

"The war drum throbs no longer, and the battle-flags are furled
O'er the parliament of nations, o'er a reunited world"

But that happy period is still in the future, and no man can say when the sun of lasting peace shall dawn upon mankind. President Jefferson believed we could compel other nations to do us justice by withholding trade from them. Referring to this method, he declared: "I believe we have in our hands the means of peaceable coercion." This seemed to contain good reasoning, and the President soon had the opportunity to put it to a test.

"Peaceable coercion."

The Barbary States of northern Africa had been an intolerable nuisance among nations for hundreds of years. Their pirates swarmed over the Mediterranean and robbed Christian ships and murdered their crews or held them for ransom. Instead of wiping the miscreants from the face of the earth, as any one of the leading powers could have done, they paid tribute or blackmail to the swarthy wretches on condition that they would not harm the Christian vessels when they ventured upon the Mediterranean. It was cheaper to do this than to send a fleet thither and exterminate the pirates. Hardly had we won our independence, when we joined the other nations in buying protection from the Barbary States. The insolence to which we submitted sounds incredible. When our tribute was a little tardy in reaching them, they clapped on a heavy fine to teach us a lesson, and we meekly paid it, and promised to be more prompt in the future. Sometimes they took the whim to have the payments made in naval stores, and we complied without protest. Then they insisted that it was their right to set the valuation for themselves. We did not say "nay," even when we knew they reduced the valuation by one-half. Captain William Bainbridge could hardly contain his indignation, when upon his arrival in Algiers, he was ordered to lower his flag and run up that of the foreign country. "You are my slaves," said the Dey; "for, if you were not, you would not pay me tribute." The American consul urged Bainbridge to obey, and, as he was under the guns of the Algerine forts, he had no choice. "I hope," said the angry officer, "to deliver my next tribute from the mouths of my cannon."

The war with Tripoli.

The Bashaw of Tripoli cannot be blamed for thinking himself a mighty potentate, when all the Christian nations obeyed him. Why should he not hold them in contempt? One of our tributes to that ruler was less than he thought it ought to be, so he declared war against the United States!

President Jefferson had no chance here of bringing "peaceable coercion" into play, and no news could be more pleasing to our young navy, by whom the war would have to be waged. In August, 1801, the *Enterprise*, with twelve guns, attacked an enemy's vessel of fourteen guns. The Tripolitans were so roughly handled that they hauled down their flag, but renewed the firing when the Americans attempted to take possession. This gross outrage was repeated a second time, when the indignant officer riddled the other vessel, killing and wounding fifty men. To prove that his third surrender was genuine the Tripolitan commander threw his flag into the sea. He was compelled to dismantle his ship and was then allowed to limp home, taking with him the ironical compliments of the victor to the Bashaw. The Americans did not lose a man.

Naval victories.

Several naval victories followed, but a serious mishap occurred when the fine frigate *Philadelphia* ran upon a reef while chasing a blockade-runner. A fleet of gunboats, seeing her helplessness, flocked around her, and Captain Bainbridge was compelled to surrender. When the tide lifted the *Philadelphia* off the reef, the Tripolitans refitted and remanned her, and were in high glee over the magnificent prize they had secured.

Loss of the *Philadelphia*.

One night a small vessel slowly approached the frigate. When warned to keep off, an interpreter replied, pretending to be the captain, that he had lost his anchors in a storm. He seemed to have only two or three men on board, and a few minutes later, touched the side of the *Philadelphia*, and made fast. Instantly scores of Americans scrambled through the port holes and over the gunwale, and furiously attacked the Tripolitans. They were under the lead of the intrepid Lieutenant Stephen Decatur, who scattered the barbarians like chaff, many in their panic, leaping into the sea. Then Decatur set fire to the *Philadelphia*, and departed with his gallant comrades. The frigate was totally destroyed.

A gallant exploit.

In the latter part of 1804, the American squadron was increased to ten vessels, and a few months later, Derne, one of the principal seaports, was bombarded and stormed. Then a force of Americans began marching toward the city of Tripoli. But the Bashaw, scared almost out of his wits, made haste to sign a treaty of peace (June 3, 1805). As usual our government was more magnanimous than any other nation would have been in the circumstances. After a full exchange of prisoners, and an agreement that no more tribute should be demanded, the Bashaw was paid $60,000 for the captives in his hands, though it is hard to understand why any money at all should have been given to the vanquished barbarian.

The Dey brought to terms.

The first administration of Jefferson made so fine a record that his re-election was certain. In 1804, he received 162 electoral votes to 14, cast for Charles C. Pinckney, Federalist. George Clinton was chosen Vice-President in place of Aaron Burr.

Re-election of Jefferson.

Burr had made himself the most odious man in America, by his duel with Alexander Hamilton, fought at Weehawken, New Jersey, July 11, 1804. Hamilton penetrated the thoroughly corrupt character of Burr, and foiled so many of his treacherous schemes that Burr challenged him. Hamilton refrained from firing at Burr, but was mortally wounded himself, and died after great suffering. His death caused profound regret throughout the country, and did much to check the senseless and criminal practice of duelling. Burr afterward engaged in a treasonable scheme against the United States, involving the formation of an independent State in the southwest. He was tried and acquitted of the charge, and died after a lonely life on Staten Island in 1836.

The Hamilton-Burr duel.

The second administration of Jefferson saw the successful introduction of steam navigation. Respecting this question, credit must not be denied John Fitch, a native of Connecticut, who was a soldier in the Revolution. Possessed of much mechanical ingenuity, he constructed a boat, which, under steam propulsion, ascended the Delaware for more than twenty miles above Philadelphia. The speed of the craft was so slow, and the machinery so inefficient, that the scheme was a failure and was soon abandoned. Fitch always insisted that Fulton had access to his papers and learned what he knew about steam navigation from him. The courts, to whom the question was submitted, declared in 1817, that Fitch's contention was true. All, therefore, that can be justly claimed for Fulton is that he made the invention practicable. He went to England, in 1786, when a young man, to study painting, but was more interested in invention. Robert R. Livingston (who administered the oath to President Washington in 1789), was minister to France, whither Fulton had gone, and gave encouragement and assistance to the young American. Fulton returned to the United States in 1806, and began work on his steamboat. Such projects cannot be kept secret, and few schemes suffered more ridicule than "Fulton's Folly," as it was universally called. The inventor named his craft the *Clermont*, and she made her start up the Hudson, August 1, 1807. An immense multitude had assembled at the dock, and enjoyed themselves, as such assemblages do, by jests and prophecies of all kinds of disaster. A hush fell upon the throng, when, as the craft headed up stream, it was seen to be moving with smooth, moderate speed which soon carried it beyond view. The *Clermont* was about a hundred feet in length, and made the voyage to Albany — one hundred and fifty miles —

The first practical steamboat.

in thirty-two hours. This was the introduction of steam navigation, which rapidly spread to other portions of the Union and aided greatly in the settlement of the West.

Admission of Ohio.

The thirteenth State, Ohio, was admitted into the Union, February 19, 1803, being the first formed out of the Northwest Territory. The emigration westward, after General Wayne's conquest of the Indians, in 1794, peopled the fertile section with many enterprising settlers and its prosperity has been continuous to the present time.

Varying interests of the different sections.

Nearly half a million inhabitants had settled to the west of the Alleghany Mountains, the principal number being in Kentucky and Tennessee. The Northwest Territory contained fifty thousand, Detroit being the only settlement on any of the Great Lakes. In 1800, as we have learned, the Territory of Indiana was formed from the immense region. Railways, canals and good roads were yet to come; consequently the outlets of trade were in the southwest, and there was little in common between the East and West. The North had become mercantile, manufacturing and maritime. New England was naturally Federalist, while the South, being the opposite in her interests, grew Republican, as the name was then used, in her political sentiments. State sovereignty, popularly called "State rights," crystallized into a fixed doctrine in that section of the Union. President Jefferson broadened in his views. Since the revenues of the government promised soon to extinguish the public debt, he recommended in his annual message of 1806, a constitutional amendment, which would apply the surplus to the extension of public education, and to the construction of roads, rivers, canals and other objects of public improvement. Thomas Jefferson was a statesman in the highest sense of the term.

Prosperity of the country.

The prosperity of the country continued through the last term of Jefferson and the first of Madison. The cheapness of government lands and the easy terms of payment drew a ceaseless stream of emigration westward. Commerce and domestic manufactures grew rapidly. The construction of a national turnpike from Cumberland, Maryland, to Wheeling, West Virginia, was begun in 1806. Congress in 1807 in accordance with a provision of the Constitution forbade the importation of slaves. The charter of the United States Bank, expiring in 1811, was not renewed. This led to a large increase in State banks, the number rising from twenty-six in 1812, to two hundred and eight in 1814, which was more than was needed.

Injuries to our commerce by Great Britain and France.

During these years Great Britain was involved in a tremendous war with Napoleon Bonaparte, the greatest military genius that ever lived. In 1806, England ordered the blockade of the ports of those nations that had taken the side of France. Napoleon retaliated by decreeing the blockade of the British Islands. Then England forbade American vessels to enter any ports in Europe, except her own and those of Sweden, her ally. Napoleon promptly ordered the capture of all American vessels that had previously entered an English port.

Impressment of American seamen by England; affair of the *Leopard* and *Chesapeake*.

The exasperating course of Great Britain would have exhausted the patience of almost any nation. With her commerce crippled, the vessels of the United States were stopped and searched on the high seas by British men-of-war, who forcibly took off such sailors as they claimed were English subjects. These outrages were repeated many times, and more than one seaman, thus torn from the decks of our ships, were American subjects. The British frigate *Leopard*, in June, 1807, fired several broadsides into the frigate *Chesapeake*, because her captain refused to be searched. When three men had been killed and eighteen wounded, the *Chesapeake*, which was in no condition to fight, struck her flag.

The Embargo; the Non-Intercourse Act.

Such an infamous act would had brought an instant declaration of war at any other time, but President Jefferson only demanded reparation from Great Britain, and asked Congress to declare an embargo, or restriction upon our commerce. England disavowed the action of the captain of the *Leopard*, and promised reparation which was never made. Moreover, she refused to give up her claim to the "right of search."

Amid the excitement, the country could not close its eyes to the fact that we were in no condition to go to war with so mighty a naval power as Great Britain. The Embargo Act, passed in 1807, forbade all vessels entering or leaving American harbors except for the coast trade. The only nation that suffered from this measure was the United States. In 1809, the Non-Intercourse Act took the place of the Embargo. This let our vessels trade with all nations except England and France.

Repeal of the Non-Intercourse Act; Indian troubles.

Thus matters stood, when James Madison of Virginia and George Clinton of New York, Democrats, were elected President and Vice-President. The Non-Intercourse Act worked so ill, that it was repealed in 1810. President Madison did all he could to stave off war, without dishonor, but it looked as if events united against him. British agents stirred up the western Indians to hostility. Tecumseh, the greatest of them all, used his wonderful gifts of oratory to bring the red men into a league against the United States. During his absence on a tour among the tribes his warriors made a fierce attack upon General Harrison, November 7, 1811, at Tippecanoe, but were disastrously defeated. Tecumseh went into Canada, and entered the British service, where his ability raised him to the rank of brigadier-general.

The *President* and *Little Belt*, declaration of war.

Some months previous, the British war-vessel *Little Belt* fired into the American frigate *President*, which happened to be ready for her. When the furious battle ended, the *Little Belt* had eleven killed and twenty-one wounded and was unmanageable. Naturally each government approved the action of its officer, and the breach widened between the two countries. The forbearance of the President angered the people and they showed it by electing an overwhelming majority to Congress, which met on December 11. The President could not resist the pressure, and on June 18, 1812, in answer to a message from him, Congress declared war against Great Britain.

Divided sentiments.

It must be remembered, however, that a strong minority opposed the war. They were mainly Federalists from New England, who foresaw the ruinous effect upon their commerce. Many of their shipping half-masted their flags upon receipt of the news. The legislatures of Massachusetts, Connecticut and New Jersey protested against the war, but New York, Philadelphia and Baltimore by resolution favored the action of the government. The general enthusiasm swept away all opposition, and the country girded itself for the struggle, but it was in a deplorable condition to engage in so gigantic a conflict.

Events of 1812.

The opening event was a disgrace to American arms. General William Hull, governor of Michigan Territory, crossed the river to Detroit and invaded Canada. General Brock advanced to meet him, whereupon he fell back to Detroit. While the enemy were preparing to attack, he ran up the white flag and surrendered his army and all of Michigan.*

Late in the summer, an invasion of Canada was set on foot. A victory was gained at Queenstown

* After Hull's exchange, he was court-martialed and sentenced to death. Because of his services in the Revolution, his age, and what was thought to be extenuating circumstances, the President pardoned him. Of late years, there have been attempts to excuse the offence of Hull. Under the mellowing influence of time, posterity is prone to close its eyes to the wrongdoings of its ancestors. But charity, carried to an extreme, is maudlin weakness, as has been proved still more recently by the effort to find partial excuse even for the treason of Benedict Arnold.

Heights, October 13, but the New York militia refused to go to the help of their comrades, who were forced to surrender. General Alexander Smyth succeeded to the command but proved worthless and was removed.

There was a different story to tell of events on the ocean. On August 19, Captain Isaac Hull, nephew of the disgraced general, with the frigate *Constitution* riddled the British frigate *Guerriere* near Newfoundland; the *Wasp* defeated the *Frolic*, October 13, off the coast of North Carolina; the *United States* captured the *Macedonian*, August 31, and the *Constitution* the *Java*, December 29. These naval defeats were intensely humiliating to Great Britain.

General Dearborn made another ill-starred invasion of Canada, and after some minor successes, returned to New York and resigned. General W. H. Harrison was given command of the Army of the West and failed to recover Detroit. On September 10, Captain Oliver H. Perry defeated the British fleet on Lake Erie and by one of the most brilliant of naval victories opened the way for General Harrison to invade Canada. At the Thames, October 5, he routed the army of British and Indians, Tecumseh, the famous chief, being among the slain. This victory regained Michigan and the Northwest and closed the war in that section.

Events of 1813.

The naval victories were not always with the Americans. The dashing *Argus*, after destroying more than a score of British vessels in the English Channel, was captured August 14; the *Essex* ran up a brilliant series of victories, and, doubling Cape Horn, was playing havoc in the Pacific, when she met her end. Two British frigates, contrary to the rules of war, attacked her in a neutral port, and after a desperate conflict, compelled her to surrender. Captain James Lawrence, while his frigate *Chesapeake* was undergoing repairs at Boston, unwisely accepted a challenge from the *Shannon* and was forced to strike his colors. Captain Lawrence was mortally wounded, and in his delirium, often shouted, "Don't give up the ship!" This thrilling cry has served many a time since as the motto of the American navy.

In July, General Winfield Scott, with an army crossed the Niagara River, defeated the enemy at Chippewa, and drove them to Lake Ontario. The reinforced British were attacked at Lundy's Lane, within sound of the roar of Niagara Falls. The contest was a furious one, but the British were driven from the field. An attack by them upon Fort Erie was repulsed. The enemy then attempted to invade New York by way of Lake Champlain, but suffered decisive defeat by Commodore MacDonough and his fleet.

Events of 1814 and 1815.

Great Britain was so angered by her repeated defeats upon the ocean, that she sent an immense number of war ships across the sea and declared our whole coast in a state of blockade. In July, an army was landed near the mouth of the Patuxent River, and marched upon Washington. The city was unprepared and could offer no effective resistance. The British entered, August 24, and burned the Capitol and most of the government buildings. They then advanced against Baltimore, but were repulsed at North Point, a short distance below the city. The bombardment of Fort McHenry was a failure.*

We have learned how unpopular the war was in New England. Her disgust so deepened at sight of her idle ships, the destruction of trade, and the repeated failures of our land forces, that twenty-six delegates, representing Massachusetts, Connecticut, Rhode Island and portions of New Hampshire and Vermont, held a secret session for three weeks at Hartford, opening December 15. Since all the delegates were Federalists, the odium of what many looked upon as treason gave the death-blow to that party.

The Hartford Convention; treaty of peace.

It is not known what was really agreed upon behind those closed doors, but the general belief is that the delegates favored the withdrawal of New England from the Union unless peace was made. Be that as it may, peace was declared before the committee appointed to confer with the government reached Washington.

Russia, though her system of government is the opposite of ours, has always been our friend, and tried several times to mediate between England and us. Early in 1814, five commissioners were appointed to go to Europe for the purpose of treating with England. A meeting was held at Ghent, Belgium. After long discussion, the commissioners agreed upon a treaty, December 24, 1814, which was promptly accepted by England and sent to the United States for approval. Our country was heartily tired of the war, and though the treaty was not what was desired, it was ratified without delay. The sound of saw and hammer rang through the decaying shipyards within twenty-four hours after the reception of the news.

But there was no Atlantic cable in those days, nor any "ocean greyhounds," to bring us the tidings in less than a week. Before the news of peace reached the United States, Captain Stewart, with the lucky *Constitution*, captured the *Cyane* and *Levant*, off the coast of Brazil, February 20, 1815, and several other engagements took place upon the ocean. General Jackson won the battle of New Orleans, the most important land victory of the war, January 8.

Battles after peace was agreed upon.

As regarded the treaty itself, the Americans could have secured a better one before a gun was fired. Matters were simply put back as they were before. There was not a word of reference to the "right of search," and the important questions of the Mississippi and the Newfoundland fisheries were left to the future. The two nations agreed to do what they could to break up the slave trade, and England never attempted to enforce the right of search.

Terms of the treaty.

The War of 1812 cost us the lives of more than 18,000 men, the loss of 1,683 vessels, and created a debt of a hundred million dollars. Trade and commerce had ceased, the banks had suspended specie payments, and the country was bitterly divided regarding the struggle itself. Never was a more striking proof given of the senseless folly of war.

Cost of the war.

When the Dey of Algiers learned that fighting was going on between England and the United States, he thought it a favorable opportunity to renew his piratical raids. Commodore Decatur was sent thither with a squadron to repeat the lesson of a few years before, and he did it most effectually. He made a football of the Algerine navy, and compelled the Dey to release all his captives, and sign a treaty on Decatur's deck, by which he paid an indemnity and renounced all claim to future tribute or blackmail. Since then, the only dispute we have had with Algiers is when one of her robber chieftains kidnapped an American and British citizen in 1904.

War with Algiers.

President Jefferson's second term closed before the breaking out of the second war with England. Many of his friends wished him to be a candidate again, but he declared that none should hold the office longer than Washington, and not unwisely declined. In 1808, the Republicans, as has been stated, elected James Madison by 122 electoral votes, and George Clinton as Vice-President by 113 votes. Charles C. Pinckney was again the Federalist candidate, but only 47 votes were cast for him. In 1812 Madison was re-elected by a vote of 128, to 89 given to De Witt Clinton of New York.

Presidential elections of 1808 and 1812.

James Madison, like the first and third Presidents, was a native of Virginia, where he was born in 1751. Graduated from Princeton, he was engaged in the practice of law when the Revolution made an armed patriot of him. He received political honors at home, and, in 1780, became a member of the Continental Congress. It will be

The fourth President.

*It was while watching this bombardment that Francis Scott Key wrote our national song, "The Star Spangled Banner."

remembered that originally he was an ardent Federalist, but became an equally ardent Republican, and was Secretary of State through both administrations of Jefferson. He was held in such high regard in his native State, that the law was changed so as to permit him to serve a fourth term in Congress. His private character was without a stain. The charm and graces of "Dolly Madison," his wife, are a part of the pleasant social legends of Washington.

The Federalist party, which had held a doddering existence for nearly twenty years, was killed by the War of 1812, the death blow being the Hartford Convention. As we shall presently see, its Presidential candidate received less than one-sixth of the electoral votes cast in 1816, while in 1820 there was not even a nomination made by the Federalists.

The census of 1810 showed that our total population was 7,239,881. Virginia was still in the lead with 974,600 inhabitants, but New York was a close second, with 959,049.

James Monroe was elected President in 1816, by an electoral vote of 183 to 34, cast for the Federalist, Rufus King of New York. Daniel D. Tompkins of New York was chosen Vice-President, a number of votes being divided among other candidates. The fifth President was born in Virginia in 1758, and was a graduate of William and Mary College. He was an excellent soldier in the Revolution, and won the commendation of Washington by a notable exploit at Trenton, in capturing a battery from the Hessians, and by his fine services at Brandywine, Germantown and Monmouth. He was governor of his native State for three years, was re-elected in 1811, and shortly after, was appointed Secretary of State by President Madison. While Monroe was not a brilliant statesman, he was able and patriotic, and was fortunate above all other Presidents in attaining his high office at the beginning of a most prosperous era, during which political sentiment became more nearly unanimous than ever afterward. He died in New York city in 1831.

The fifth President.

The reaction from the depression caused by the War of 1812 had fairly begun, as we have intimated, when President Monroe assumed office. The United States possesses illimitable resources, and all that its people need is the opportunity to develop the natural wealth of the country. That this is as has been stated is proved by the fact that to-day we are the wealthiest nation in the world.

Causes of the general prosperity.

Various causes united to bring about this unexampled prosperity. France and England stopped fighting, and their respective partisans in this country, who were often at bitter enmity with each other, allowed their passions to cool, and became more American than ever. They saw that true wisdom demanded that foreign peoples should be left to quarrel among themselves and settle their own affairs, while we attended exclusively to our own matters.

The West was growing at an unexampled rate. It requires a long term of years for a community to evolve what may be termed *castes* or different classes of society, though strictly there are no classes in the United States. There was nothing of the kind in the newly settled sections. Wealth and culture made no difference; a breezy, honest, whole-souled comradeship prevailed everywhere, and pure democracy was universal. While a property qualification was required for the franchise in most of the eastern States, it was not necessary in the West. This leaven gradually worked its way toward the Atlantic, until in time all the older States were released from the restriction.

A powerful factor in the development of our country at this time was steam navigation. The year 1811 marked an era, for it saw a steamer leave Pittsburg and make its way to New Orleans. Five years later another steamer made its appearance on the Great Lakes, and a third in 1818 began regular trips between Detroit and Buffalo. A still greater triumph came a year later, when the *Savannah* crossed the Atlantic. She could not carry enough fuel to furnish steam for the whole voyage, and part of the distance was made under sail. Ocean navigation by steam had been proved feasible, though it was not successfully established for nearly twenty years. The busy craft, however, began puffing, in rapidly increasing numbers, on the western rivers, carrying passengers and freight, often engaging in trials of speed, with now and then a boiler explosion to make matters lively. These steamers helped in making people of different sections acquainted with one another, and in developing trade to a remarkable extent.

Steamboat navigation.

Let us briefly note the new States that were formed during the era of prosperous reaction. Louisiana had come into being, April 30, 1812, after the general carving up of that enormous territory. Indiana was admitted December 11, 1816. Several French posts were established within its limits as early as 1702, among them being Vincennes, the early capital of Indiana Territory.

Admission of new States.

Mississippi became a State December 10, 1817; Illinois, December 3, 1818; Alabama, December 14, 1819; Maine, March 15, 1820; and Missouri, August 10, 1821. Mississippi was originally settled by the French in 1716, was joined to Georgia in 1763, and organized into a Territory in 1798. Illinois was settled by the French at Kaskaskia, in the same year that William Penn made his famous treaty with the Indians (1682). Fort Dearborn, on the site of Chicago, was a trading post for years after the admission of the State. A fort was built on Mobile Bay by Frenchmen under Bienville, and Alabama became a part of Georgia and afterward of the Mississippi Territory. Maine, one of the earliest settled sections of the Union, remained a part of Massachusetts until able to "go alone." Missouri was settled in 1720, and was part of the Louisiana purchase. We shall find it necessary to refer more at length to its admission into the Union. The census of 1820 showed that our population was 9,633,822. New York had forged to the front with her 1,372,111 people, while Virginia with 1,065,116 inhabitants, was closely followed by Pennsylvania and her 1,047,507 population.

The census of 1820.

General attention was given to common school education in nearly every part of the country. At the opening of the nineteenth century, the following colleges and universities had been founded: Bowdoin, 1794; Brown University, 1764; Charleston, 1785; Columbia University, 1754; Dartmouth, 1769; Dickinson, 1783; Franklin and Marshall, 1787; Georgetown University, 1789; Greenville and Tusculum, 1794; Hampden-Sidney, 1776; Harvard, 1636; Princeton, 1746; Rutgers, 1766; St. John's, 1784; University of Georgia, 1785; of Nashville, 1785; of North Carolina, 1789; of Pennsylvania, 1740; of Tennessee, 1794; of Vermont, 1791; Washington and Lee, 1749; Washington College of Md., 1783; Washington College of Tennessee, 1795; Western University of Pa., 1787; William and Mary, 1693; Williams, 1783; Yale, 1701.

Colleges and Universities.

Of the similar institutions added to this list during the first quarter of a century, the following were founded from 1815 to 1825: Allegheny, Auburn Theological Seminary, Central University, Colby, Colgate University, Columbian University, Franklin, General Theological Seminary, Maysville, Newton Theological Institute, Cincinnati University, and the University of Virginia. The most famous school for the education of women was established by Mrs. Emma Willard, in 1821, in Troy, N. Y. Similar institutions soon followed in different parts of the country. The American Bible Society was organized in 1816, and in the same year, the first savings bank was started in Philadelphia.

It inevitably followed that the stoppage of the importation of foreign goods led to the establishment of many factories. Full success was checked by the foreign goods which were sold

Tariff measures.

cheaper than they could be manufactured in this country. This obstruction was removed by the imposition of a tariff or tax upon such goods, though, as has been said in another place, there will never be a unanimity of sentiment as to the degree of protection that ought to be extended to manufacturers, or whether they should be given any protection at all.

When the electoral vote of 1820 was counted it was found that every one of the 232 was for Monroe. This unanimity had not occurred since Washington, nor, in the nature of things, can it ever occur again. Profound as was the respect in which Monroe was held, there was a general feeling that he was encroaching upon ground that was sacred. "The honor of a unanimous election to the presidency," said the elector from New Hampshire, "should be bestowed upon none after George Washington; I therefore cast my vote for John Quincy Adams." The delegate was applauded, and so the record stands. Surely the "era of good feeling" had dawned, but it was impossible that it should last.

Presidential election of 1820.

One fact should be noted regarding our flag, which was patterned in 1777. The first decision was that with the admission of each new State, another stripe and another star should be added to the emblem. This was done until the stripes numbered eighteen, when, without any official action thereon, the increase of the stripes was stopped, for it was evident that the symmetry of the incomparably beautiful design would be destroyed if the additions continued. Think how the flag would look to-day with forty-five stripes, and a further increase close at hand! On April 4, 1818, Congress reduced the number of stripes to thirteen, and decreed that that should always be the number, but on the 4th of July, succeeding the admission of every new State, a star should be added to the blue field as its representative. Nine days after the passage of this act, the first flag of the new pattern was unfurled to the breeze over the Hall of Representatives.

The Stars and Stripes.

Florida proved a thorn in the side of our country. It was sparsely settled, and belonged to Spain, and the inhabitants consisted mainly of Seminole Indians. Touching the States of Georgia and Alabama, Florida, with its vast swamps, morasses, streams, and impenetrable forests, became a veritable Mecca to runaway slaves. The overseer might chase his property to the edge of the wild region, but, if the negro succeeded in plunging into it, pursuit was useless. The Seminoles welcomed these panting Africans, the two races intermarried, contented in their crude way with living beyond the reach of their former owners. The mongrels were a degraded, vicious people, and they joined the Seminoles in committing many atrocities upon the exposed settlements. A good many believed that the Spanish officials were responsible for these outrages, and that the Seminoles would have caused no trouble had they not been instigated thereto by the white men. Such was the opinion of General Andrew Jackson, the hero of New Orleans, who, when given command of a military force, for the punishment of the Seminoles, urged that he should be allowed to go to the fountain of the trouble and conquer Florida, where the Spanish authority was weak. He was *officially* ordered to refrain from such conquest, but there is reason to believe that our government secretly approved his scheme, as he always vehemently insisted was the fact. No one ever questioned "Old Hickory's" truthfulness. If it was done in his presence, the doubter was certain to regret it.

The first Seminole War.

General Jackson descended like a cyclone upon the Seminole towns, burned them to the ground, slew many of the warriors, and then captured Pensacola and several towns. In Pensacola he found two British subjects, one a Scotch trader named Arbuthnot, and the other a former British officer, Ambrister, both of whom were arrested on the charge of inciting the Seminoles to commit their outrages. A court martial established their guilt, and Ambrister was sentenced to receive fifty lashes and a term of imprisonment, while hanging was prescribed for the trader. Jackson, not only carried out the sentence of the latter, but hanged Ambrister also.

An unjustifiable act.

We Americans are too ready to approve an act that is unwarranted by law, if it only smacks of vigor and resentment toward another nation. There was no justification for Jackson's execution of these two men. No nation in the world is so prompt in the protection of her citizens as England, and she sternly demanded reparation for the outrage. Had this been refused, she would have declared war. A Congressional committee of investigation censured Jackson, whose act was disavowed by our government. Then Congress acquitted him of blame, and he became more popular with his countrymen than before. The incident strengthened the sentiment in favor of annexing Florida, and, since the chief occupation of Spain, for the last century and more, has been that of parting with her territory, she sold Florida to the United States, in February, 1819, for five million dollars, the formal transfer taking place two years later. The population was so sparse that it was not admitted as a State, until more than twenty years later. The price named was accepted by Spain in satisfaction of claims against her for previous war damages. An important corollary of the purchase of Florida was the first definite establishment of the boundary between the American and Spanish possessions. The line passed the Sabine, Red, and Arkansas rivers, with meridian lines between, northward to the 42d parallel, and thence westward to the Pacific.

Cession of Florida to the United States.

A prolonged dispute took place with Great Britain over the ownership of the Oregon country. The fur trade was very valuable, and it was vigorously carried on by the citizens of both countries. We have learned that John Jacob Astor was early in the field, but his enterprise was checked by the War of 1812. Captain Gray, an American, had ascended the Columbia for a considerable distance in 1792, naming the stream for one of his vessels, and Lewis and Clark entered the region about a dozen years later; but, before the conclusion of the war with Great Britain, her subjects had taken actual possession of Oregon, and we all know how difficult it is to oust a nation in such circumstances. In October, 1818, Great Britain and the United States agreed that our northern boundary should be the 49th parallel from the Lake of the Woods to the Rocky Mountains, the country west of the mountains to be held jointly by the two nations for ten years. The controversy, however, was by no means settled and remained a bone of contention for nearly a generation.

The Oregon controversy.

Spain is the worst colonizer among nations. Three centuries and more ago her dominance threatened the world. Her colonial possessions were prodigious, and her grandeur recalled in some respects the Roman empire of ancient times. But her policy toward her colonies was not only cruel and treacherous, but idiotic to the last degree. It followed, as effect follows cause, that the kingdom steadily declined in power, and her dependencies began falling away from her. The nineteenth century was still young when her South American countries set rebellions on foot, which resembled the proverbial sheep leaping over a wall. In fact those "republics" formed such a taste for revolution that it has been their principal occupation since that time. Naturally, Americans felt a strong sympathy with the colonies fighting for independence. Early in 1822, Congress recognized them as sovereign nations, which was a decisive help to the struggling peoples. A year later, all the colonies, except the Spanish West Indies, gained their independence.

Revolt of the Spanish-American colonies.

One of the gravest of perils threatened our national existence about this time. In 1815, after the crushing of Napoleon Bonaparte, Russia, Prussia and Austria entered into the compact known as the Holy Alliance. Its purpose

The "Holy Alliance."

was to stamp out all republican risings of the people in their respective dominions, and to make monarchial rule absolute. Probably they intended to help Spain in subduing Mexico and other of her colonies. Then there would have been apportionments of territory among the different nations in payment for their services, and new footholds would be gained by more than one European nation upon our continent. This momentous peril was clearly foreseen by American statesmen. In December, 1823, President Monroe, in his annual message to Congress declared that the American continents "are henceforth not to be considered as subjects for future colonization by any European powers." This constituted the "Monroe Doctrine," which is one of the most cherished articles of our political faith. The policy which had crystallized long before in the hearts of the people, was put into words by John Quincy Adams, Monroe's Secretary of State. England was our ardent ally in the declaration of this policy, for she had good reason to distrust the Holy Alliance. That fantastic league, which like all such organizations, exhaled professions of love for law and order and claimed to be acting as the instrument of heaven, did not dare to offend the lusty young republic of the West, when Great Britain stood behind her, and the Holy Alliance soon became a memory only.

The "Monroe Doctrine."

Now there is a good deal of misapprehension regarding the scope of the Monroe Doctrine. It will be seen that not only Latin America, but Great Britain and even Continental Europe are the beneficiaries of this admirable policy. The establishment of outposts of foreign nations on our mainland would be an intolerable nuisance; but we are bound by the Monroe Doctrine to prevent the spoliation of England's possessions in the West Indies, and in Central and South America, and to guard against Canada being wrested from her by an enemy. England itself may be invaded by a European coalition, but such coalition must keep its hands off the Western Hemisphere. Moreover, though a few nations sneer at the Monroe Doctrine, they must see that they are guarded from endless temptations to conquest and from jealousy of the expansion of their neighbors on this side of the ocean. Should we disavow our policy, the leading powers of Europe would soon be wrangling over the division of Spanish and Portuguese America.

World-wide benefit of the policy.

On the other hand, it cannot be denied that the assertion of the Monroe Doctrine imposes certain responsibilities upon us. We cannot interpose to prevent the deserved punishment of a Latin-American republic, where civil war and anarchy are the normal condition, when it grossly violates the rights of a European nation. We are not the policemen of the Western Hemisphere, but we have the right to interpose and say to what length such punishment shall be carried. Obviously, we could not permit any European power to despoil the offending state of any of its territory, in the way of chastisement. Thus, for instance, if Venezuela refuses to pay an honest debt to Germany, that power has the right to confiscate the republic's revenues, but not to the extent of utter ruination.

Scope of the Monroe Doctrine.

It is on this point that much misconception prevails in Europe. The right of any government to punish vigorously the crimes of assassination, imprisonment, personal injury, kidnapping or robbery is unquestionable. There is danger, however, in the use of fleets and armies to compel the payment of debts; for it is not difficult to conceive of a case where the public debt might be so great that its ultimate collection would involve a prolonged occupation of that country's custom houses, and the debtor would lapse into the condition of Egypt, which has become a virtual possession of England, through its inability or unwillingness to pay its just debts. The same is to be said of Morocco. More than one European power has intimated that our declaration of the Monroe Doctrine does not preclude its virtual annulment through the means just outlined. Such a view on their part, however, is erroneous,—a fact which they are certain to learn the moment they approach forbidden ground. When the Roman Senator confronted the armies of Antiochus and Ptolemy, he drew a line with his staff upon the sand and said: "Thus far shall ye come and no farther!"

While Monroe's election was really unanimous, this unanimity of sentiment, in the nature of things, could not continue long. Too many questions divided public interest, to permit the 'era of good feeling" to continue. One of these questions, respecting which a wide diversity of sentiment arose, was that of internal improvements. Monroe, like his predecessors, Jefferson and Madison, believed that a constitutional amendment was necessary before Congress could comply with the demand, arising from the rapid increase of inland settlement, for improvement in the means of travel and traffic. The demand has been since met, without such constitutional amendment, to a degree, of which the original advocates never dreamed.

The question of internal improvements.

Another question has divided the people from the organization of national government. As we know a protective tariff was enacted in 1816, but the manufacturers were not satisfied with its provisions, which they did not think went far enough. Their clamor was satisfied for the time in 1824, when various industries were protected by a high tariff. Henry Clay, the leading champion of the "American system," in the course of a speech in Congress, proudly called the attention of the members to the fact that the tasteful coat, trousers, and vest, which he wore were the production of his Kentucky plantation.

Tariff measures.

The burning question which forced itself to the front, however, was slavery. The student of American history will not fail to note a significant fact regarding the peculiar institution. When Alabama was admitted as a State in 1819, the whole number was 22, of which one-half were free, and one-half slave. This was not accident, but the result of an understanding that the balance should be preserved between the two sections in the Senate. But the vast region opened up to settlement by the Louisiana purchase would attract a far greater free labor than a slave population. The alarmed South saw that the only way to preserve their equal power in Congress, was by continuing to offset the increase of population with the increase in the number of States. It must be borne in mind, that the United States government never had the right to interfere with slavery in any State where it had been established. But for the invention of the cotton gin, it soon would have been abolished in the northern tier of Slave States, and, in the course of time, must have disappeared from the extreme South. From the cause named, the States below Mason and Dixon's line became more devoted to slavery than before, and more jealous of any checks to the spread of the institution.

The slavery question.

Although the States themselves were secure against governmental interference, as affecting slavery, it was maintained that the Territories were not, and that the Constitution authorized legislation thereon. The next State admitted after Alabama (1819) was Maine (1820), a free State. The southern members would not agree that Maine should be made a State, unless the northern members consented that Missouri, which applied for admission in 1819, should be admitted with slavery. The quarrel became bitter, threats of disunion were heard, and many saw the sure ripening of the crimson harvest that was garnered in 1861–65.

The end of the quarrel was the Missouri Compromise, the work of Henry Clay. Enacted in 1820, this allowed the admission of Missouri (August 10, 1821), as a slave State, but prohibited slavery forever after, north

The Missouri Compromise.

of the parallel of 36° 30′, which forms most of the southern boundary of the State. It seems strange that the question of what was to be done in the case of the admission of a State lying partly north and partly south of that line, was not considered, and yet, in less than a generation, it had to be met.

In the election of 1824, four candidates were put forward, all ostensibly Republicans: Andrew Jackson of Tennessee, John Quincy Adams of Massachusetts, Henry Clay of Kentucky, and William H. Crawford of Georgia. Jackson received 99, Adams 84, Clay 37, and Crawford 41 electoral votes, while on the popular vote, Jackson had a plurality of over 50,000. Still he lacked a majority of the electoral vote, and once more the election was thrown into the House of Representatives, which chose Adams for President, and John C. Calhoun of South Carolina for Vice-President. The disappointed friends of Jackson charged that this election was brought about by a corrupt bargain between Clay and Adams, and when the latter appointed Clay his Secretary of State, the belief became more widespread. Adams and Clay were the most honorable of men, and declared that nothing in the nature of such an agreement had ever been made between them. The recognition by important appointments of his ablest opponents in the same party, is a graceful act and is quite common, on the part of the successful candidate.

Election of 1824.

The sixth President was the son of the second, and was born in Massachusetts in 1767. He received every advantage and was highly educated. Washington appointed him minister to The Hague, his father transferred him to Berlin, he served as United States senator, as minister to Russia, was our commissioner at the treaty of Ghent, and Monroe's Secretary of State throughout both his terms. After retiring from the presidency, he represented his district in Congress, and was stricken with apoplexy and died while a member of that body, February 23, 1848. John Quincy Adams was one of the most unpopular of our Presidents. His integrity, his ability, and his patriotism were of the loftiest character, but he lacked winsomeness of manner, and never tried to gain the good will of any one. Where a few graceful words would have made a friend, he remained mute (being the exact opposite of Clay in that respect); where a little patience would have conciliated, he was impatient; where silence would have been golden, he spoke; where a little trimming of sail might have been advisable, he did not swerve a hair's breadth; and, at the time when our Presidents, as a rule, are making all possible combinations, plans, and pledges to secure a second term to themselves, Adams refused to lift a finger or to do or say a thing that could improve his chances. He was foreordained from the first to be a one-term President.

The sixth President.

Although Adams held office only four years, these years were marked by several important events. The first was the completion of the Erie Canal. This grand work, 387 miles in length, with 72 locks and a depth of 7 feet, connects Lake Erie with the Hudson at Albany, thus opening the seaboard by water communication to the western extremity of the Great Lakes, and establishing a new and favorable route for western emigration. It may be said that it brought the extensive and rich agricultural region of New York into the open market of the world. The cost of freight transportation from Albany to Buffalo dropped in a short time to one-twelfth of what it was in 1820. Cities and towns sprang up along the route, and the population of the State of New York leaped past that of Virginia, — a pre-eminence that it has maintained ever since.

The Erie Canal.

Governor De Witt Clinton turned the first spadeful of earth at Rome, July 4, 1817, and the canal was opened October 26, 1825, the cost of construction being $10,000,000. Since then the improvements have made the total amount expended $52,540,800, and, despite the competition of the railways, it still does an immense traffic.

A still more important step in the development of our country was the introduction of steam railways. The first railway by a coincidence was laid, in 1826, near the home of President Adams in the granite quarries of Quincy, Massachusetts. It was only two or three miles long, however, and was operated by horse power. A few months later a similar but longer line was constructed to connect the coal mines of Mauch Chunk, Pennsylvania, with the Lehigh River. The first steam locomotive to turn a wheel in America was on the Delaware and Hudson Railroad in August, 1829. Thus the real introduction of this important invention did not take place until after President Adams retired from office.

Introduction of railways.

It has been explained why the South determinedly opposed the increase of tariff duties, since the inevitable result to that section, which practically had no manufactures, was to make it pay higher prices for goods. In 1828, an act was passed, which was so oppressive to the South, that it was termed "The Tariff of Abominations." It caused hot indignation, was bitterly denounced, and South Carolina advocated nullification. All that she waited for was a leader, and he presented himself within the following four years.

The "Tariff of Abominations."

In the closing months of Adams' term, those of the same political principles with him and Clay, assumed for the first time, the name of *National Republicans*. It may be added that the term *Whig* was not used until 1834, when it was adopted by all the political factions opposed to Jackson, his wing of the Republican party having taken the name of *Democratic-Republicans*, or plain *Democrats*. In the election of 1828, Jackson received 178 electoral votes to 83 cast for Adams. John C. Calhoun, of South Carolina, one of the leading statesmen of our country, but ardently in favor of State sovereignty, was chosen Vice-President.

Presidential election of 1828.

Andrew Jackson is one of the most unique figures in American history. He was born in North Carolina in 1767, his father dying before the son's birth, and his mother passing away while he was still a boy. Both his brothers lost their lives during the Revolution, and when only thirteen years old, Andrew fought in the patriot ranks. He pursued the study of law in a crude way, and when a young man settled in Tennessee. His aggressive nature led him to plunge into the wars with the Indians, who were committing many atrocities and he punished them with remorseless rigor. He filled several political offices, and won the admiration of his countrymen by his personal daring, his burning patriotism, his incorruptible honesty and rugged Americanism. No one is so popular with us as the military hero. General Jackson's victory at New Orleans made him President and the most popular man with the masses, since Washington's time. The faults of such a man, though they may be fewer in number, are as potent as his virtues. Jackson had a fiery temper, and nothing could convince him that the judgment or views of any one else were right, if they chanced to be different from his views. The slightest act of dishonesty, no matter by whom committed, was unpardonable to him: thenceforward he was that person's unrelenting enemy. He turned men out of office by the wholesale, because they disagreed with him in politics; no opposition or argument could abate his resolution that matters should go as he thought they ought to go. He regarded the members of his cabinet as simple clerks, and had a number of cronies with whom he discussed, while smoking his corncob pipe, the affairs of his nation. Prominent and able as were the men who composed his "Kitchen Cabinet," they were the only ones who possessed any influence with "Old Hickory," and that influence, when analyzed, was insignificant. He died a tranquil Christian death, June 8, 1845.

The seventh President.

President Jackson believed that the United States Bank had done all it could to defeat his election.

That belief, for which there was certainly warrant, made him the relentless enemy of the institution. Aside from the personal element in his enmity, he thought the corporation was a superficial stimulus to business and the cause of speculation and corruption. In justification of these views, it should be stated that when the bank was reorganized in 1817, it gave many facilities for extravagant ventures. The officers of the branch bank in Baltimore drew over two million dollars beyond its securities from the bank, and but for prompt measures, the Bank of the United States would have gone into bankruptcy. The first charter expired in 1811, and was not renewed until 1816, when another charter for twenty years was granted. A bill for its renewal having passed Congress in 1832, was vetoed by Jackson. The following year he ordered that all deposits of public money should be removed from the national bank, and distributed among certain State banks. It cannot be denied that in taking these summary measures, Jackson exceeded his constitutional powers, but they added to his popularity with the masses. In the election of 1832, he received 219 electoral votes, against 49 for Henry Clay, National Republican; 11 for John Floyd, Independent; and 7 for William Wirt, Anti-Masonic candidate. Jackson was now the foremost Democrat, as Henry Clay and Daniel Webster were the foremost Whigs.

The Bank of the United States.

Election of 1832.

Reference has been made to the trouble with the Seminole Indians of Florida. Georgia, in 1802, had ceded portions of the present States of Alabama and Mississippi to the national government on its pledge to remove the Indians, who were Creeks and Cherokees, as fast as it could be done. The red men, learning the object of the frequent purchases of land from them by Georgians, refused, in 1824, to sell any more land. They were tricked into making a few additional sales, some time later, and the Georgians, impatient with the delay of the government, attempted to remove the Indians forcibly. This was unwarrantable and President Adams interfered. Georgia was defiant, and a collision was imminent between the State and Federal governments. A new treaty was made with the Creeks, who consented to remove west of the Mississippi. The Cherokees, however, stayed in Georgia, as they had a right to do, and the Seminoles did the same in Florida, as they also had the right to do. Jackson was a believer in the doctrine enunciated not many years later, to the effect that the only good Indian is a dead one, and he backed Georgia in her determination to drive out the Cherokees, regardless of treaty pledges. They were forced to accept a goodly sum for their lands, and were driven out by a military force in 1838, and compelled to start for the Indian Territory. One-third of them died on the long, cheerless journey.

Troubles with the Creek and Cherokee Indians.

The rich lead mines of Illinois and Wisconsin drew thousands into that section, where the Winnebagoes, Sacs, and Foxes were the owners of the lands. Under the leadership of the chieftain, Black Hawk, the Indians offered a venomous resistance, but in the end were compelled to sell their territory in 1832, for an annuity in money and in annual supplies.

The Black Hawk War.

The Seminoles in Florida steadfastly refused to leave their inaccessible swamps, and there seemed no way of driving them out. Several of their minor chiefs were plied with liquor and bribed into signing away their lands. The enraged leaders killed a number for their treachery, and began a war which promised to last forever. It was marked by frightful atrocities. In the latter part of 1835 Major Dade with one hundred men was ambushed, and all slain excepting two, who afterward died from their wounds. On the same day, Osceola, the famous mongrel leader, fired a volley into a house where General Thompson was dining with several friends, and killed him and four officers. Osceola was induced to enter the American lines under a flag of truce, was made prisoner, and died in Fort Moultrie, where he was confined, in 1838. It was not until 1842 that the war was finally brought to an end. Then the Seminoles yielded and followed the other tribes across the Mississippi, where the Indian Territory had been set apart for them in 1834.

Last Seminole War.

Hardly had President Jackson vetoed the new charter of the United States Bank, when a new tariff measure was enacted. Its author was Henry Clay, the champion of protection. The bill retained high duties on articles that competed with home products, and lowered or removed them on articles produced in the United States. President Jackson signed the act which was to go into effect, March 3, 1833.

South Carolina flamed up anew. The legislature called a State convention which met in November, 1832, and was presided over by the governor. An ordinance was passed which declared that the tariff acts of 1828 and 1832 were unconstitutional and therefore null and void; that the duties should not be paid and any attempt to collect them by the government would be resisted, and South Carolina would secede from the Union. This startling ordinance was to go into effect, February 1, 1833.

Perhaps the most fervent sentiment of which Andrew Jackson was capable was his love for the Union. The best side of his nature now asserted itself. His proclamation of December 10, 1832, was an admirable document. He argued with the South Carolinans gently but firmly, and closed by warning them that he had no discretion in the matter; that disunion by armed force is treason, and he should execute the laws, with all the military power necessary.

The nullification flurry.

The appeal was thrown away upon the hot-headed State, "child of the sun," and she never slackened her war preparations. General Scott, with the sloop-of-war, *Natchez*, and several revenue cutters were sent to Charleston harbor, the troops being kept out of sight, but within easy call in the various forts. General Scott was an officer of remarkable discretion. He mingled with the leading citizens, and cultivated their good will and that of their families. His exquisite tact had much to do with soothing the resentful anger of the people. At the same time, other Southern States remonstrated with South Carolina, some of whose leaders began asking themselves whether they were not going too far toward disunion. Henry Clay saw that the time had come for a concession on the part of the government. He introduced his "Force Bill" and "Compromise Tariff," which were under discussion in Congress when the date fixed by South Carolina for action arrived. She decided to await the fate of the two bills. They were signed by President Jackson, March 2, 1833. These measures provided for a general reduction of duties until June 30, 1842, when they were to attain a level of twenty per cent. This gradual scaling down gave the manufacturers time to adjust their business to the new conditions, and satisfied the nullifiers, who repealed their ordinance, and all became tranquil for the time.

President Jackson displayed his fervent Americanism, whenever occasion justified it. We had a just claim against France, amounting to five million dollars for the spoliation of our commerce during the Napoleonic wars. The matter had dragged on for nearly twenty years, with the prospect of settlement as far off as ever. Jackson ordered our minister to withdraw from France and advised Congress in 1834–35, to authorize reprisals. France flared up, but paid the money, and similar bills were promptly settled by Spain, Portugal, Denmark, and Naples.

Troubles with foreign governments.

Two States were admitted into the Union during Jackson's administration, Arkansas, June 15, 1836, and Michigan, January 26, 1837. The former was settled by the French in 1685, and came to us through the Louisiana purchase, in 1803. Michigan was settled still earlier at St. Mary's Falls, in 1668, and Detroit was

founded in 1701. It was set off in 1805 from the Indian Territory.

The prosperity of the country under Jackson was amazing. Nothing of the kind had ever been seen before, and in many respects it has never been equalled since that time. This was mainly due to extensive internal improvements, and the introduction of a number of important inventions. The Erie Canal was fairly in operation, its prodigious impulse permeating the whole country. Railways, as we have learned, were born in this country under John Quincy Adams, but they did not attain anything like vigorous growth until Jackson's time. In November, 1830, the first locomotive to pull a train regularly, made its trial trip over the road connecting Charleston and Hamburg, South Carolina, a distance of one hundred and thirty-six miles. The Mohawk and Hudson railroad, uniting Albany and Schenectady, began operations in the summer of 1831, and was rapidly followed by others in different parts of the country. There were virtually no railways in the United States when Jackson came into office; when he retired more than 1,500 miles were in operation. To-day, our railway tracks, if joined, would girdle the earth eight times.

Growth of railways.

In December, 1833, Obed Hussey of Maryland, patented a reaping machine, and in the following year, Cyrus H. McCormick of Virginia took out a patent for another reaper. Both did their work well, but McCormick made the greater improvements, and his machines, in the course of time, were in demand in every civilized country. William H. Seward declared that McCormick's invention carried the line of civilization westward at the rate of thirty miles a year.

Reaping machines.

There were a few people here and there, who had discovered that anthracite coal gave a more intense and concentrated heat than wood. It came slowly into general use, however, and was adopted by a few steamboats, and on a number of railways in 1836. In 1805-6, a resident of Newport, R. I., made a gas apparatus from which he lighted his house. The means of illumination was introduced in Baltimore in 1816, the other cities gradually adopting it, Philadelphia not doing so until 1835. Among the minor, and yet important inventions, were friction matches in 1829, steel pens in 1830, and the American revolver in 1835.

Introduction of illuminating gas.

Other inventions.

It must be remembered that not only were railways rapidly extending, but steamboats were increasing very fast. The lonely pioneer, who lived too far from his nearest neighbor to see the smoke of his chimney, was startled by the sound of a whistle or the ringing of a bell, and, looking out upon the stream in front of his cabin, saw the little steamer churning the water into foam, as she puffed past, in quest of passengers and freight. Regular lines were established upon the principal rivers, between important towns, some of the craft being of palatial elegance, while the contests of speed kept up the steamboat explosions to a degree that would have been permitted in no other country.

Increase of steamboats.

The prosperity was universal. Population quadrupled between 1790 and 1830, and the 75 post offices grew to more than 8,000. The government receipts from the sales of western lands increased from one million to twenty-five million dollars yearly, so that in 1836, not only was the national debt paid, but a surplus had accumulated and continued to accumulate. Congress passed an act for the distribution of this surplus, amounting to nearly $40,000,000, among the different States, as a loan without interest. The apportionments were to be made in four quarterly payments, but for reasons, soon to appear, the distribution was not completed.

Payment of the national debt.

One striking and yet natural result of this great prosperity must be noted. The increase in the means of travel and intercommunication brought the inhabitants of different sections nearer one another. They exchanged commodities and became acquainted. The convenience and novelty of the new methods of travel tempted thousands to make journeys, such as they had never made before. When the young married couple bade their parents and friends goodbye, preparatory to taking up their homes in the West, it was not looked upon as probably the final parting in this world. The two expected to make a trip eastward in the course of a year or two, and perhaps the parents would indulge in an excursion themselves to the Far West — well to the east of the Mississippi — traveling by train, steamboat, or stage. The man who had made the voyage to Europe and back was no more pointed out on the streets as an object of wonder, as was the case in earlier times. Such ventures were becoming too common to cause remark.

Unifying of interests.

This mingling of the people of different sections had a unifying effect. Diverse as were their industrial interests, all were proud of the fact that they belonged to the same family and had a single glorious past and present and future. Fashions, customs, and habits were modified. Old things were put away, and, if not all, certainly a great many things, became new. The changes in these respects during the administrations of Jackson were greater than during any preceding or succeeding half century of our history.

Although the prosperity of our country was great, yet it was not wholly real. It had dangerous factors. The wholesale westward emigration started an era of speculation in lands. Thousands believed they could locate the sites of populous towns and cities, which, owing to the improved means of travel, would speedily spring into existence. The distribution of the United States Bank deposits among various State banks added vastly to the number of the latter. The majority had only meagre capital with which to redeem their notes, but they issued the latter by wholesale, some of them so poorly printed that they were inferior to their crude counterfeits. The possessor of such flimsy stuff could well afford to outbid the purchasers of western lands, who offered gold and silver. When the time came for redeeming their notes, many of the banks failed, changed their location, and renewed their swindling operations. The disastrous effects of this "wild cat" banking were not felt until the succeeding administration.

False prosperity.

The distribution of the national surplus added to the mania for speculation. The monetary crash was precipitated by Jackson's stubborn course in July, 1836, taken against the advice of his cabinet, and in pursuance of his unshakable belief that he was the only man who was invariably right on any and all questions of public policy. He issued his "specie circular" which ordered that only coin would be accepted in payment for public lands. Congress saw the general ruin that was coming, and, at the earliest possible hour in 1837, repealed the specie circular. Jackson held back the bill against the urgent arguments of his friends and the moneyed interests of the country, until it failed to become a law.

Jackson's "specie circular."

With the clouds darkening the skies, the time for a new presidential election came around. Five candidates entered the field: Martin Van Buren, Democrat, of New York; William Henry Harrison, Whig, of New York; Hugh L. White, Whig, of Tennessee; Daniel Webster, Whig, of Massachusetts; and Willie P. Mangum, Whig, of North Carolina. It will be observed that this was the first entrance of the Whig party into national politics. Of the electoral votes cast, Van Buren received 170; Harrison, 73; White, 26; Webster, 14; and Mangum, 11. There was no choice of a Vice-President, and the Senate chose Colonel Richard M. Johnson of Kentucky. One of his chief claims to recognition was the distinction — never clearly established — of having shot the famous Indian Chief Tecumseh, at the battle of the Thames, in October, 1813.

Presidential election of 1836.

Martin Van Buren was born in Kinderhook, N. Y.,

December 5, 1782. He was the first President, therefore, not born a subject of Great Britain. He was one of the most adroit politicians ever evolved in the State pre-eminently noted for such rulers of organizations and men. He has been called the "Little Magician," and was chief of the band of able politicians in New York, known as the "Albany Regency," which ruled the State, much after the manner of Tammany's present dominance of the city. After serving as United States senator and governor of New York, Van Buren resigned the latter office to become Jackson's Secretary of State. In 1831, Jackson nominated him as minister to England, but the Senate refused to confirm the nomination. Becoming Vice-President in 1832, he had the satisfaction of presiding over the dignified body that had put this slight upon him. He was Jackson's choice as his successor, and, as was the rule, "Old Hickory" had his way. Van Buren died, July 24, 1862.

The eighth President.

The financial tempest broke in all its violence with the coming in of Van Buren. Sometimes such panics are inexplicable, and sweep over the country with the appalling wilfulness of a hurricane or cyclone. But there could be no mistake as to the cause of the panic of 1837. It may have been partially due to conditions beyond the control of the stern, self-willed patriot, but to him, more than to any other man, or any score of men, was due those woful days, when during the first two months of his successor's administration, the failures in New York and New Orleans amounted to $150,000,000, and nearly three hundred houses in the metropolis suspended payment. The condition of the country became so bad that eight States failed wholly or partially (Mississippi repudiating her entire debt), and, by and by, the national government itself could not pay its debts. Thousands of shops and manufactories were idle, bread riots occurred in the city of New York, and nearly all industry was at a standstill. The most fortunate people were the farmers, for, though they had little or no money, they could compel the soil to yield them a sustenance.

The panic of 1837.

Van Buren was a man of marked ability, who saw the blunders of his predecessor, though he lacked the moral courage at the time to withstand them. He called Congress together in September, 1837, and laid before it a clear, forcible statement of the real condition of the country. Since the universal bank suspension, the Treasury had retained its own funds, and the President urged that this should be the future policy. Subtreasuries should be established, thus making the government the custodian of its own funds. This would exclude politics from any interference with what should be a simple business arrangement of banking affairs. The Senate passed such a bill, but the House rejected it. The President persisted and an Independent Treasury was formed in 1840.* Meanwhile, Congress had authorized the Secretary of the Treasury to issue $10,000,000 to meet the immediate demands of the government.

An Independent Treasury established.

Oppressive government in Canada caused a revolt in 1837–38, with which Americans naturally sympathized. This was well enough, but a good many sympathizers were resolute to go to unlawful lengths, by aiding the "Patriots." This was almost certain to involve us in a war with England, and the President issued a proclamation, forbidding American citizens to take part in the revolt in any way, and warning all who did so that no protection would be given them by their own government. Notwithstanding this proclamation, a party of Americans seized Navy Island in Niagara River, and chartered a steamer to carry supplies to the insurgents. They were attacked by British troops, twelve killed, and the steamer was set on fire and carried over the falls. It was not until a strong military force was sent to the frontier by our government that order was established.

The "Patriot War" of 1837–38.

The American public, whether justly or unjustly, holds an administration chiefly responsible for the evils that occur under it. President Van Buren performed his high duties with intelligence and honesty of purpose, but he was unpopular and his defeat was inevitable. In 1840, the candidates were Van Buren, W. H. Harrison, Whig of Ohio, and James G. Birney, the Liberty Party candidate of New York. Harrison received 234, Van Buren 60, and Birney no electoral votes; John Tyler of Virginia was chosen Vice-President.

Presidential election of 1840.

The presidential election of 1840 was one of the most remarkable in our history. There were no inflammatory questions to divide the Democrats and Whigs, but rather the sentiment for and against a change. John Tyler, the Whig nominee for Vice-President was known to be a follower of Calhoun and an opponent of Jackson's bank and tariff views, but his political principles were vague, and he was nominated to win the southern vote. It has been proved in quite recent times that the most trivial incident may produce decisive results in a presidential struggle. The canvas was bitterly personal. A Democratic paper, in a sneering reference to Harrison, said that if he were pensioned with a few hundred dollars and given a barrel of hard cider and a log cabin, he would be content for the rest of his life. This slur was taken up by the Whigs, and ran through the country like wild fire. Log cabins, of all sizes from a toy to a dwelling house were carried in hurrahing processions, and, sad to say, enough hard cider was drank to set back the cause of temperance for years. General Harrison had won the battle of Tippecanoe, and the slogan was —

"Tippecanoe and Tyler too," though, as has been said, not much was known of the political sentiments of Tyler, but he was in good company, and that was sufficient. There was no end to campaign songs, which were sung with unexampled ardor by men, women, and children. Bonfires turned night into day, and the enthusiasm seemed to turn the country upside down.*

General William Henry Harrison was a native of Berkeley, Virginia, where he was born February 9, 1773. His father, Benjamin, was a signer of the Declaration of Independence, and governor of Virginia. The son studied medicine, but was drawn to a military life, and made an excellent record on the frontier and in the War of 1812. He was appointed secretary of the Northwestern Territory in 1797, and two years later was its first delegate to Congress, and afterward its governor. He was also a United States senator and minister to Colombia, South America. While possessed of fine ability, he never would have been President except for his victory at Tippecanoe, in 1811.

The ninth President.

President Harrison was verging upon three-score and ten when he assumed office. He was in feeble health, and having been accustomed to outdoor life, he found the change unbearable. Then he was driven almost out of his senses by the clamor of office-seekers. He broke down and died just one month after his inauguration.

John Tyler was another Virginian, having been born March 29, 1790. That he possessed great ability is proved by the fact that he was a member of the Virginia legislature at twenty-one, governor at thirty-five, United States senator at thirty-seven and President at fifty-one. He died January 18, 1862.

The tenth President.

Tyler was the first Vice-President to succeed to the presidency, and, although elected on the Whig ticket,

* This bill was repealed the following year, re-adopted in 1846, and is still in operation. The public revenues are paid on demand to the treasury department by the collectors and are not deposited in any bank. The system has long since proved its value.

* [It is recorded that at a largely attended religious meeting, in one of the Western States, presided over by a venerable clergyman, the hymns, after a time, unconsciously but irresistibly swung over into the most vigorous of campaign songs, and the minister afterward naïvely explained that, finding he could not stem the current, he swam with it, and sang as ardently as the deacons and brethren themselves.]

he soon let it be known that he was by no means in accord with many of that party's cherished principles. He was opposed to high tariffs, internal improvements and a United States Bank. He would not have gone as far even as Jackson in using a military force to suppress nullification. His views exasperated the Whigs, some of whose leaders insisted that a Vice-President succeeding to the presidency as Tyler had done, was constitutionally bound to carry out the policy of his predecessor, and had no right to frame a different one. This contention, however, was idle. All the prerogatives of the exalted office belong to whomsoever holds it.

President Tyler's quarrel with the Whigs.

Congress met in special session in June, 1841, with both branches in the hands of the Whigs, under the leadership of the eloquent Henry Clay, whose principles were in direct opposition to those of Tyler. The latter signed the bill which abolished the Independent Treasury, enacted under Van Buren. Then the pet measure of Clay and the Whigs — chartering a United States Bank — was passed, and went to the President for his signature. He vetoed it for reasons which seemed easy to overcome. The question was discussed with him and a new bill passed. To the dismay and indignation of the Whigs he vetoed that also. One of two explanations is possible: the President was misunderstood at the conference, or he changed his views. Be that as it may, no other attempt has been made to organize an immense national bank, holding a semi-official relation to the United States government. Moreover, subsequent history leaves little doubt that in vetoing the measure, President Tyler did a wise thing.

Resignation of the cabinet.

The Whigs openly broke with the President. The most contemptuous expression they could employ regarding a man was that he had become "Tylerized." He had retained all of Harrison's cabinet, but every member resigned, excepting Danial Webster, Secretary of State, who retained office only long enough to complete certain negotiations upon which he was engaged when he also resigned his portfolio. These negotiations related to the Maine boundary over which there had been discussion for several years. Lord Ashburton and Daniel Webster consulted in a commendable spirit, and settled the dispute in a manner that reflected the highest credit upon both. The agreement was made in 1842, our northeast boundary as far west as the Rocky Mountains, being fixed as it is to-day.

Settlement of our northeast boundary.

Tyler's numerous cabinet changes.

No President ever had such a varied cabinet as Tyler. During his single term his Secretaries of State were: Daniel Webster, Hugh S. Legaré, Abel P. Upshur, and John C. Calhoun; Secretaries of the Treasury, Thomas Ewing, Walter Forward, John C. Spencer, and George M. Bibb; Secretaries of War, John Bell, John McLean, John C. Spencer, James M. Porter, and William Wilkins; Secretaries of the Navy, George E. Badger, Abel P. Upshur, David Henshaw, Thomas W. Gilmer, and John Y. Mason; Postmasters-General, Francis Granger, and Charles A. Wickliffe; Attorneys-General, John J. Crittenden, Hugh S. Legaré, and John Nelson.

A shocking accident.

Some of the changes noted above were due to a sad accident which occurred, February 28, 1844. While Commodore Stockton was firing an immense piece of ordnance, on the steamer *Princeton*, for the entertainment of a number of distinguished guests, the cannon exploded and killed Gilmer, Secretary of the Navy, Upshur, Secretary of State, Virgil Maxey, formerly Minister of The Hague, Commander Kennon and others, besides wounding several sailors so grievously that they died.

Rebellion in Rhode Island.

We have not forgotten that in 1663, Roger Williams secured a charter for Rhode Island. This charter allowed no one to vote, who did not own a certain amount of property. The dissatisfaction over this restriction grew until 1842, when it reached a climax. Thomas W. Dorr called a convention, which adopted a new constitution and elected him governor. The regularly elected governor resisted when Dorr attempted to take possession of the capital. The quarrel assumed threatening proportions, but finally ended without bloodshed. Dorr was convicted of treason and sentenced to imprisonment for life. He remained defiant and in the end, was released and restored to citizenship. Rhode Island adopted a more liberal constitution, which became effective in May, 1843.

The Anti-rent troubles in New York.

We learned long since of the patroon system, founded by the New Netherland Company, by which enormous grants of land were made to certain persons as a reward for forming settlements upon them. The plan failed and was abandoned in 1638, but among the estates already granted was one to Lillian Van Rensselaer, which was twenty-four miles wide and had a frontage on the Hudson of forty-eight miles. The vast extent of this tract can be understood, when it is recalled that there is room for only three with the same boundaries between New York and Albany. These grants, with their feudal privileges, passed from father to son, and were not affected by the Revolution, though more than one member of the Van Rensselaers fought on the side of England during the war for independence. The rent charged against the tenants was the veriest trifle, — one day's work each year, two or three chickens, or a few pints of flour. Stephen Van Rensselaer was an easy-going landlord, like many of his ancestors, and allowed his tenants to do as they pleased about paying their rent. If they chose not to pay at all he would not allow them to be disturbed, and the majority took advantage of his kindness. So it came about that when he died in 1840, his heirs found a large sum due them for back rents, and being of a different mind from him, they set about collecting it. The tenants fiercely resisted, the military were called out, and in 1844, a virtual state of civil war existed throughout the disaffected region. There were incendiarism, violence and bloodshed one of those killed by the "Anti-renters," being a deputy Sheriff. The troubles were not fully ended until 1846. In that year, a constitutional amendment abolished all feudal tenures, and concessions enabled nearly all the tenants to buy the lands occupied by them.

The rise of Mormonism.

A preacher named Solomon Spaulding, a native of Connecticut, but living in Ohio, wrote a weird romance, whose chief aim was to prove that the American Indians were the descendants of the Lost Tribes of Israel. It was a habit of his to read portions of the manuscript to those who cared to listen, and he wound up with the declaration, as he folded the sheets, that, when published, it would cause a profound sensation and make him wealthy. He removed to Pittsburg, and placed the manuscript in a printing office for publication, but he never saw it again. In answer to his inquiries, he was told that it had been lost. Most likely it was stolen. Several years after his death the *Book of Mormon* was published. When some of Spaulding's former neighbors came to examine this curious work, they agreed that they had heard the clergyman read the same extracts from his manuscript.

In 1827, Joseph Smith of Palmyra, N. Y., publicly declared that an angel of the Lord had presented him with a new Bible, written on golden plates, and three years later, he published his *Book of Mormon*, which, there is every reason to believe, was the Spaulding manuscript, revised to suit Smith's purposes. No new faith, however farcical, fails to produce converts. Smith was soon able to establish a church, and he removed with his followers to Kirtland, Ohio. Their practices made them so odious to their neighbors that they were driven out, and they crossed to Illinois, where, in 1840, they founded the city of Nauvoo. It was there that the shocking system of polygamy was established. The Mormons again made themselves execrated by the outside world. In June, 1844, during a furious riot, Smith and his brother were shot. Brigham Young now came to

the front, and, determined to place himself and people forever beyond reach of the United States and its civilization, he led them to Utah, where, in 1848, was founded a city, which, as regards cleanliness and attractiveness, has no equal anywhere in the world. In this distant country the Mormons were almost lost and forgotten, until 1848, when thousands of emigrants began hurrying across the plains in quest of gold in California. Investigation proved that more than one of the so-called Indian massacres were instigated and led by disguised Mormons. Twenty years after the Mountain Meadow slaughter, the guilt of several of these miscreants was so clearly established, that they were convicted and hanged.

The present great State of Texas formerly belonged to Mexico. It became a sort of "city of refuge" to fugitives from justice, adventurers and desperate men, with a considerable number who went thither to develop the great natural resources of the country and improve their own condition. In 1835, this scattered, mongrel population revolted against Mexican rule, under the leadership of an eccentric character "Sam" Houston (he would never acknowledge the name "Samuel"), and gained their independence at San Jacinto in 1836. Texas became the "Lone Star" Republic, and was recognized as such by the United States, England, France, and Belgium. Houston was its first President.

Texas.

The student of American history has perceived before this how rapidly and surely the baleful question of African slavery was forcing itself to the front. Texas had become independent; inevitably she would ask for admission into the Union; Mexico would resist; war with her would follow, with it also equally inevitable that Texas would be wrenched from her and formed into an American State. Thus a new domain, imperial in its dimensions, would be added to our slave territory. The South was sure to urge, and the North to oppose the admission of Texas. On March 1, 1844, Congress passed a joint resolution for the admission of Texas, which was not formally admitted until December 29, 1845, when Tyler was no longer President. The only State admitted during Tyler's term was Florida, March 3, 1845, the day before he went out of office. We have already become acquainted with its previous history.

The slavery question.

Admission of Florida.

Texas, the bone of contention between the North and South, was visited by Spanish missionaries as early as 1524. The people called the region "Mixtecas," from which the present name probably came. Late investigations prove that Texas to the Rio Grande should have been included in the Louisiana purchase. The population for a long time was sparse, but, at the time of its independence, it had grown to about 20,000. President Tyler, in 1844, made a secret treaty with the Texan authorities, providing for the admission of Texas, but the Senate indignantly rejected it.

Early history of Texas.

Benjamin Lundy, in 1815, founded an abolition organization known as The Union Humane Society, and afterward issued a newspaper, devoted to the same cause, called *The Genius of Universal Emancipation*. No marked effect accompanied his efforts, but the small band of agitators slowly grew in numbers. William Lloyd Garrison became the leader and was powerfully supported by the eloquent Wendell Phillips and the able preacher, Theodore Parker. These men were determined in their efforts, and often roused angry opposition in the North, where, more than once, they were mobbed. The abolitionists were disunionists; they demanded the rooting out of slavery wherever it existed, and denounced the Union as a covenant with Satan and a "league with hell." The controversy could not be kept out of Congress, where the quarreling sometimes culminated in violence and bloodshed. Blind indeed was the man who did not see the awful tempest that was gathering in the sky.

The abolitionists.

Reference has been made to the balance that was preserved in the admission of free and slave States. When, however, Michigan came in (1837) the area for southern expansion was exhausted. The Indian Territory, organized three years before, absorbed all the territory remaining south of the Missouri Compromise line, while above it was enough land to form ten or fifteen States. The North was steadily forging ahead of the South, which had good cause to feel alarmed for the stability of its peculiar institution.

Shrinkage of southern expansion.

Such being the situation, the reason why the North opposed and the South passionately favored the admission of Texas, is clear. The question became a national issue and resulted in a curious mixture of nominations. Henry Clay announced his opposition to annexation and was quickly nominated by the Whigs. The dream of his life was to become President, but the effect of his declaration was to alienate the South. His attempts to "explain" did not win over the southerners and drove away the anti-slavery vote. Van Buren made a similar declaration and thereby lost the Democratic nomination. James K. Polk of Tennessee was an ardent annexationist, became the standard bearer of the Democrats, and received 170 electoral votes to 105 for Clay. James G. Birney had been put forward again by the abolitionists, and though he had a popular vote of 62,500, none of the electoral votes went to him. George M. Dallas of Pennsylvania was chosen Vice-President.

Presidential election of 1844.

Polk was nominated in Baltimore, May 29, 1844. As soon as the fact was known, a rush was made to a waiting train, which steamed away at full speed for Washington. When the occupants scrambled out nearly two hours later, to tell the important news, they were met with the astounding statement that Washington had received the tidings "long before." In truth, the news had been carried thither by electro-magnetic telegraph, that being the first public telegram ever sent over a wire. It was the invention of Prof. S. F. B. Morse, who had conceived the idea in 1832, and underwent poverty, privation and no end of ridicule in bringing the idea to perfection. The honor of this important invention is justly shared by Prof. Joseph Henry, of the Smithsonian Institute. *

The electro-magnetic telegraph.

One of the popular Democratic war cries was "Fifty-four forty or fight!" This was alliterative and had a very catchy sound, but that is all that can be said in its recommendation. The grounds upon which we claimed Oregon have been stated. England insisted that she had explored and settled the territory previous to the visit of Captain Gray in 1792. The missionary Marcus Whitman visited the section in 1835, and came back with so encouraging a report that the Board of Missions sent him and several others to Oregon. Hurrying after him, were so many emigrants, that the English fur companies took the alarm and sent thither a large number of settlers from Canada. Whitman saw what was certain to follow and started for Washington to warn the government of the certainty of its losing Oregon, unless prompt measures were taken to save it. In referring to the valuable services of Whitman, his arduous journey must not be forgotten, even though, as has been lately maintained, his chief interest was mission business. In those days such a journey, across vast prairies and raging torrents, over stupendous mountains, and through a dismal almost interminable solitude, inhabited by hostile Indians, was enough to turn back the bravest hunter. But the indomitable Whitman accomplished it, covering most of the distance in the depth of a severe winter. He reached Washington in March, 1843, and so impressed the government by his statements, that he was promised that no settlement of the boundary question should be made,

Oregon saved by Marcus Whitman.

* The first message (now in the possession of the Connecticut Historical Society) was dictated by Prof. Morse in Washington to Annie Ellsworth, and was received by Alfred Vail, in Washington, forty miles distant. It was "what hath God wrought."

until a party of emigrants were led to Oregon. With the same energy, Whitman instantly set to work to rouse public enthusiasm in the new country. He succeeded so well, that before the end of three years ten thousand Americans were settled there, while the English occupants were clustered about the few posts of the Hudson Bay Company. The claim of neither England nor the United States to Oregon was clear, and a compromise was made. The 49th parallel of north latitude, which was our boundary from the Lake of the Woods to the Rocky Mountains, was extended to the coast, but Vancouver Island remained in the possession of Great Britain.

The eleventh President.

James K. Polk was born in North Carolina, November 2, 1795, but while still young removed to Tennessee, with whose interests he became identified. He represented the State for seven terms in Congress, and was elected governor in 1839.

War with Mexico.

As everyone knew would be the case, war with Mexico quickly followed the admission of Texas. The weak but proud government, harried and torn by revolution and civil strife, would neither acknowledge the independence of Texas, nor accept the Rio Grande as the southern boundary. She claimed that the Nueces River was the right dividing line. On July 4, 1845, the Texan legislature notified our government of the act of annexation, and, knowing of the Mexican sentiment, asked the United States to protect her. The President sent General Zachary Taylor into the disputed territory with a military force of 4,000 men, and dispatched a naval squadron to the Gulf.

General Taylor assumed possession between the Rio Grande and the Nueces, and built Fort Brown, opposite Matamoras. While there he was notified by the Mexican commander that war had begun.

The first hostilities.

This was in the month of April, 1846, and in the same month, Captain Thornton and his dragoons were compelled to surrender to a much larger force of Mexicans. This gave Congress the pretext for which she was waiting, and that body lost no time in declaring that war existed by the act of Mexico, in attacking an American force, while on American territory. In his message to Congress, President Polk tried to fire the patriotism of his countrymen, by declaring: "Mexico has passed the boundary of the United States, has invaded our territory and shed blood upon the American soil." Senator Benton, in his *Thirty Years' View*, condemned the action of our government as an "unparalleled outrage." It must be admitted that in our war with Mexico, while might was on our side, *right* most certainly was not.

The President called for 50,000 volunteers, and the arrangement and prosecution of the campaigns were entrusted to General Winfield Scott, the head of the army since 1841. General Taylor left a small garrison at Fort Brown, and collided, May 8, with a much larger force than his own at Palo Alto, and after a fierce battle defeated it. The next day he engaged a strong body of Mexicans at Resaca de la Palma. The issue was doubtful for a time, but was decided for the Americans by a gallant cavalry charge of dragoons, led by Captain May. The Mexicans fled in a panic across the Rio Grande, whither Taylor followed them a few days later, captured Matamoras and then waited for reinforcements.

When sufficient troops had been provided, General Scott set three campaigns on foot: General Kearny,

Plan of campaign.

with one division was to pass the Rocky Mountains and seize the northern provinces of Mexico; General Taylor was to conquer and hold the Rio Grande region, while Scott himself was to advance from the coast directly upon the capital of the country.

The Mexicans were far inferior to the Americans as soldiers. They displayed a headlong bravery at times, but lacked the steady valor, the grim persistency, and the cool courage, which rarely or never was stampeded Their officers were much the inferior of ours in training and military skill, and the final issue of the war was certain from the first.

Thoroughness of Gen. Scott's preparations.

General Scott deserved credit for the thoroughness of his preparations. As usual, the newspapers felt it their duty to instruct him as to the proper conduct of the campaign, but he paid not the slightest heed to their clamor, and refused to allow his ships to leave the wharfs until the last ounce of supplies was on board. The difficult landing on the Mexican coast was made without the loss of a man, and the advance into the interior was equally deliberate and careful. An officer who served under him remarked to the writer: "From the time we left New York, including our march inland, I was not ill an hour, nor did I (and this includes all the officers and privates, so far as my knowledge extends) miss a single meal."

Capture of Monterey.

General Taylor received sufficient reinforcements to increase the number of his men to 6,600, when he advanced upon Monterey, which was defended by a garrison almost twice as great. The city was invested and captured, September 24, after desperate fighting. The Mexicans were pursued over housetops and through dwelling houses, where numerous sanguinary hand-to-hand encounters took place. In one of these a young lieutenant, fresh from West Point, named George B. McClellan, had a narrow escape with his life. Many other of his comrades won distinction in the subsequent war between the States.

General Scott ordered General Taylor to join in the advance from the Gulf. While marching to do so, he was vehemently assailed at Buena Vista (February 23, 1847), by Santa Anna with twenty thousand Mexicans. The battle lasted throughout the entire day, but when darkness came the enemy retreated. This victory closed the active operations of General Taylor in Mexico.

Victory at Buena Vista.

Meanwhile General Kearny, advancing from Fort Leavenworth in June, seized and garrisoned Santa Fé. The people there preferred to submit rather than fight. On the way to the Pacific coast Kearny was met by a courier with word that Colonel John C. Fremont had conqured California. Before Kearny reached the coast the whole country had fallen into the possession of Fremont, Commodore Stockton, and several hundred American settlers. On the way thither General Kearny occupied New Mexico, and proclaimed the province annexed to the United States.

Conquest of New Mexico and California.

With an army of 12,000, General Scott in March, 1847, invested Vera Cruz, on the road to the city of Mexico, and the city surrendered twenty days later, the victorious troops still being distant 200 miles from the capital. But the road was open and the final campaign began.

The final campaign.

At the mountain pass of Cerro Gordo, Santa Anna, with a large force of Mexicans, made a furious resistance, but was utterly routed, and fled in such a panic that his wooden leg was picked up on the field. Then the Americans swept through Jalapa and Pueblo, and on the 10th of August, from their elevation, looked down into a lovely valley and saw the beautiful capital of Mexico in the clear sunlight. Reaching Ayotla, Scott found the fortifications so formidable that he swung to the south, and thence eastward, and confronted Contreras, within ten miles of the capital. Contreras was stormed with such impetuosity that in about twenty minutes it surrendered. San Antonio and the heights of Churubusco rapidly followed, and then the frightened Santa Anna sent out proposals for negotiations. His terms were inadmissible, and, since it was evident he was only trying to gain time, the attack was renewed. The defenses went down like ten pins and the assailants camped within the outskirts of the city.

Santa Anna was a treacherous foe. He had agreed, while in exile and before the breaking out of the war,

to betray his country for a large sum of money, an instalment of which was paid to him, but, finding himself unable "to deliver the goods," he turned patriot. Knowing that the city was doomed, he liberated a horde of convicts, on their promise to resist the Americans, while he and the officials slunk off in the darkness of night. The sun was hardly above the horizon the next morning (September 14, 1847), when the city of Mexico surrendered, and General Scott, standing in the public square, proclaimed the conquest of the country.

Capture of the city of Mexico.

The fall of the national capital was the end of the Mexican war, which, unjustly prosecuted by us, had reached its triumphant conclusion. The Mexicans, however, kept up a desultory, sputtering resistance until the following January, when they entered into negotiations with a commissioner of President Polk, and a treaty of peace was signed at Guadalupe Hidalgo, February 2, 1848, by the terms of which we acquired Texas, with the Rio Grande as its southern boundary, New Mexico, Arizona, and California. These provinces included Nevada and Utah, and parts of Colorado and Wyoming. For this enormous territory, sufficient for an empire, Mexico was paid $15,000,000, and American claims against her to the amount of $3,250,000 were assumed by our government.

Terms of peace.

A few weeks before the treaty of peace was signed with Mexico, a discovery was made in California which caused unparalleled excitement throughout the civilized world. Several men were digging a raceway for a mill, on the American branch of the Sacramento River, for Colonel Sutter, a Swiss, who was commandant at Fort Sutter, when one of the party noticed what seemed to be a yellow pebble, gleaming in the water. He picked it up and found it resembled a bit of brass. It could not be that, however, for there was no metal of that nature about the mill. There had been rumors of gold in the neighborhood, and with a suspicion of the truth, the man and his companions gathered up several more of the tiny pieces and sent them to Sacramento for scientific test. The horseman who carried them thither, came back with his sweating animal on a dead run, and shouting to his friends the thrilling news: "It's GOLD! it's GOLD!"

Discovery of gold in California.

Such an amazing discovery could not be kept secret, though the effort was made. When the news found its way to the East, people smiled and shook their heads, refusing for a time to believe the reports. Then the Philadelphia mint made known that it had received some of the particles, tested them, and found them pure gold. President Polk, in his annual message, accepted the fact as established, and then the public was convinced. The soil of California contained enough auriferous deposits to buy a kingdom.

As the truth penetrated to the four quarters of the earth, a series of processions started toward the Pacific coast, the like of which the world has never seen. Some of them crowded the ships to suffocation and made the laborious and dangerous voyage around Cape Horn; some plodded for months over the prairies and mountains, fording and swimming torrents, exposed to flaming heat and tempestuous cold, and fighting fierce Indians for most of the way; others, landing on one side of the Isthmus, set out to tramp to the Pacific, and such as did not die from fever or disease, took ship again for the modern El Dorado, which was speedily turned into a vast mining camp. In two years, the population grew to a hundred thousand. The total production of gold by California since then has been about a billion dollars. The annual output is still large, though less in value than the agricultural productions.

Prodigious emigration to California.

Iowa was admitted into the Union, December 28, 1846, and Wisconsin, May 29, 1848. The first settlements in Iowa were made at Burlington and Dubuque in 1833, and the territory, originally a part of the Louisiana tract, was organized separately in 1838. Wisconsin was visited by French fur traders early in the seventeenth century, but Green Bay was not settled until a hundred years later.

Admission of Iowa and Wisconsin.

The South saw too many proofs of the growth of anti-slavery sentiment to doubt the danger that menaced the institution. While the Act organizing the Territory of Oregon was before Congress in 1846, a Pennsylvania member offered an amendment excluding slavery. It passed the House by a considerable majority, though it failed in the Senate. When the bill appropriating money during the negotiations with Mexico was in the House, David Wilmot, a Democratic representative from Pennsylvania, submitted a proviso shutting out slavery from all territory acquired from Mexico. This shared the fate of the former amendment, but the fact that both passed the popular branch of Congress gave the matter a significance which all saw. The debate was kept up, with the final result that the Senate yielded as regarded Oregon, but slavery was admitted into the southern Territories. Texas, however, was the last slave State admitted, and the agitation gave an increasing distinctness to the line of demarcation between the North and South. The question could not fail to enter into the presidential struggle, despite every effort of the leaders to keep it out. Many Democrats and Whigs in the North, angered by the aggressiveness of the slave interests, united as "Free Soilers," with Martin Van Buren, our old acquaintance of New York, as their leader. The regular Democratic convention nominated Lewis Cass of Michigan as President, while the Whigs put forward General Zachary Taylor.

Slavery in the new Territories.

The "Free Soilers."

In making the last nomination, the Whigs were exceedingly shrewd. We do not need to recall that no hero is so much a hero to us, as the military one. Taylor possessed all the elements of popularity. His career in Mexico had been brilliant and he was the first American officer to receive a brevet. He was a patriot, honest, straightforward, and of such brusque manner that he had been admiringly dubbed "Old Rough and Ready," by his countrymen. There was a feeling abroad also that he had been unjustly treated in the campaign in Mexico, owing to jealousy of him in high quarters. This sentiment is one of the most effective weapons in politics.

If the reader asks why General Scott, the head of the army, with his fine record, was not made the standard bearer of the Whigs in 1848, the answer is that it was mainly due to his personality. Scott was imperious, overbearing, impatient of contradiction, and without any magnetism in his nature, as we call that quality which enables one man to draw others to him. And yet, as between the two, Scott was much the abler man. No more striking evidence can be asked of the potency of "availability" than that the Whig party with Daniel Webster, Henry Clay, and other great statesmen in its ranks, should send down to a Louisiana plantation and select a colonel, who felt so little interest in politics, that he had not cast a vote for forty years. Yet he received 163 electoral votes to 127 for Cass.

Presidential election of 1848.

Zachary Taylor was born at Orange Court House, Virginia, September 7, 1784, making the eighth chief executive given to our country by the "mother of Presidents." Of these, however, W. H. Harrison, Polk, and Taylor, were citizens of other States at the time of their election. The parents of Taylor removed to Kentucky when he was an infant. With a scant education, he entered the army, and made one of the finest of soldiers. It was because of his gallant defense of Fort Harrison, on the Wabash, in the War of 1812, that President Madison made him a brevet major, he being the first American officer to receive an honorary rank. He showed no interest in politics, being satisfied to serve his country, without questioning or caring for the policy of the government. When a letter was sent to him, notifying him of his nomination, he refused to take it out of the post-office, because he

The twelfth President.

had been vexed by the number of letters sent to him with the postage unpaid, and for whose contents he cared nothing. Failing to receive an acknowledgment, the committee had to send a special messenger to General Taylor, before the truth was learned. Though a slave-holder himself, Taylor held no sectional views regarding the institution, and was a patriot to the core, who entered upon his duties with the best wishes of his country. He selected an able cabinet for there was need of his doing so.

When he assumed office, the rush of gold seekers to California was at its height. That section was certain soon to apply for admission into the Union, and slavery once more reared its hideous front. The problem which many had foreseen now presented itself, for a part of California lies to the north and a part south of the dividing line of slavery fixed by the Missouri Compromise. California made its application and the old quarrel broke out at once. The South, with some show of justice, demanded concessions for the admission of the immense area as a free State. These demands were that all of the remaining territory obtained from Mexico should be opened to slavery; that a considerable portion of New Mexico should be given to Texas, in quittance of her boundary claims; and that the surrender of slaves should be through Federal officials to be appointed, since many State officials had failed to perform such duty, as required by the Federal statutes of 1793. The anti-slavery men demanded in turn: the application of the Wilmot Proviso to all Territories; the abolition of slavery in the District of Columbia; and of all slave trade among the States.

Wrangle over the admission of California.

Here was a quarrel which threatened civil war, and which only one man could avert. That man was Henry Clay, now past three-score and ten, and bowed with infirmities and increasing years. With heart glowing as of old with a love for the Union, he came forward with a compromise measure as he had done nearly a generation before, when Missouri was clamoring for admission. This, because of its numerous provisions, was known as the "Omnibus Bill," and provided that: California was to be admitted as a free State; Utah and New Mexico were to be organized as Territories, without any provision regarding slavery; Texas was to be paid $10,000,000 to surrender its claim to New Mexico; the slave trade (but not slavery) was to be prohibited in the District of Columbia; and a fugitive slave law was to be enacted, securing the return of slaves by the free States to which they might escape. All the persuasion of the silvery tongue of Clay and the majesty of Daniel Webster's eloquence were necessary to carry the bill through both branches of Congress, but it was done.

In the midst of the heated discussion, President Taylor fell ill, and died July 9, 1850, and was succeeded by the Vice-President, Millard Fillmore. He was born, February 7, 1800, at Summer Hill, N. Y.; was a school teacher for several years, but became a successful lawyer, was State comptroller and a congressman for four terms. He possessed good ability, but does not rank among our leading Presidents. He died March 7, 1874.

Death of President Taylor. The thirteenth President.

President Fillmore was one of the many admirers of Henry Clay, and a believer in his compromise measures. He promptly signed the Omnibus Bill when it was passed and placed before him, and it became the law of the land.

In the meantime California, tired of waiting for the action of Congress, adopted a free State constitution, and was admitted into the Union as the thirty-first State, September 9, 1850. This interesting section was visited by the Spanish navigator, Cabrillo, in 1542, and the first Spanish settlements were made a little more than a hundred years later. The Franciscan friars established presidios, or mission stations, in different parts of the country for the conversion of the Indians. They became rich, but were stripped of their possessions and authority in 1822, when Spanish authority in California was overthrown. It seems strange that throughout all those years no discovery was made of the exhaustive stores of gold, over which the friars trod to and fro every day. The emigration to California was insignificant until the discovery of gold raised it to tremendous proportions.

Admission of California.

The dearest ambition of Henry Clay and Daniel Webster—as it has been of many a man before and since—was to be elected President of the United States. Clay was nominated three times (1824, 1832, and 1844), and but for his political trimming, would have been elected in 1844. He once bitterly said that when his prospects were good he was not nominated, and when they were bad he was certain to be the nominee. He was one of the greatest statesmen and orators born in this country, and was idolized by a large number of his countrymen. He might have been put forward again in 1852, but he was on the verge of the grave, and indeed died that year.

Henry Clay.

Daniel Webster ranks among the foremost orators of ancient or modern times. He ran for the presidency against Van Buren and three other candidates in 1836. He complained with cause that the South, and indeed the country, was ungrateful for his services, refusing recognition, when such recognition could benefit him. His popularity was destroyed in the North by his advocacy of Clay's compromise, though justice must ascribe to him motives of high patriotism. None saw more clearly than he and Clay the fearful abyss yawning in front of the Union, and though the deadly grapple must come, they postponed it for a time. He and Clay died in the same year.

Daniel Webster.

The intolerable provision in the North in the Omnibus Bill was that which decreed the surrender of runaway slaves by the free States into which they might escape. Although this was the law, it was openly defied in many places, and the pursuers of such fugitives not only had their property wrested from them, but often suffered violence themselves. The only place where the fleeing negro was absolutely safe was Canada. Her soil was free, and Great Britain would allow no one to lay hands on him.

The Fugitive Slave law.

But it was a long road from slavery to freedom, from the Ohio to the Great Lakes or the St. Lawrence, and the fugitive slave could have hardly made the journey without the aid of friends. In order to give such aid one of the most ingenious and complete systems conceivable was perfected. A runaway, after getting across the Ohio, was quite sure to fall into the hands of those waiting to receive him, or, having received secret information, he knew the lonely path which he was to follow to reach such a friend. There he was ingeniously hidden until the hue and cry had partly subsided, when he was conducted at night to another station of what was known as the "underground railroad." The danger naturally decreased as he pushed northward, and finally vanished when he stepped upon British soil.

The underground railroad.

Scores and more made up the dusky procession threading its stealthy way toward the north star, but not always was the panting fugitive successful. Sometimes the pursuers were upon him before he could reach the first station of the underground railway, and hustled him back to bondage. Slavery had a good many friends in the North, and the Federal commissioners often did their duty unflinchingly.

The exasperation against slave catching in their territory led several northern States to pass more rigid "personal liberty" laws. These guaranteed a jury trial to every negro accused of being a runaway slave, although such privilege was denied by the Fugitive Slave law. In Boston, in 1851, a slave was forcibly taken from a United States marshal and sped on his way to Canada. Three years later, Anthony Burns, another fugitive negro, was arrested and lodged in jail. The incensed citizens met in Faneuil Hall to decide whether his

Personal liberty laws.

Anthony Burns.

surrender should be permitted. Meanwhile, another mob savagely assailed the building in which the negro was confined, with a view of releasing him. A deputy marshal was killed, but the prisoner was not rescued. He was sent on board a revenue cutter, strongly guarded by military, who at more than one point were in imminent danger of attack.

Uncle Tom's Cabin.

One of the most powerful agents in unifying sentiment in the North against slavery was the publication of the remarkable work, *Uncle Tom's Cabin*, by Harriet Beecher Stowe, a sister of the famous clergyman, Henry Ward Beecher. The manuscript was declined by several publishers, and the Rev. Mr. Stowe, husband of the author, remarked that if she made enough from the sales to purchase a silk dress, both would be satisfied. Yet it sold by the hundred thousand, was translated into the leading languages of Europe, and still retains no slight popularity. Dramas founded upon the story are well patronized, and many admirers of the genius of the author find a pleasure in rereading the volume to-day. The work is a graphic portrayal of what slavery might very well be, rather than of what it actually was, and this was done with such skill and power that *Uncle Tom's Cabin* takes rank as one of the greatest books of the nineteenth century.

The slave interests neglected no expedient that promised an extension of their territory. A party of filibusters under Lopez invaded Cuba in 1851, hoping to bring about its annexation to the United States. It came to naught, and Lopez was executed in Havana, as he unquestionably deserved to be. Then William Walker entered into the filibustering business, giving attention to Nicaragua and Honduras. He grew bolder because of several partial successes and his immunity from punishment, but the inevitable overtook him in 1860, and he went the way of Lopez.

The Ostend Manifesto.

The most extraordinary of the pro-slavery effusions was given to the world in 1854. In October of that year, Mr. Buchanan, minister to England, Mason, minister to France, and Soulé, minister to Spain, came together at Ostend and produced a document which declared that it was the duty of the United States, as a matter of public safety, to secure possession of Cuba by purchase if possible, and, in the event of Spain refusing to sell, then the island should be forcibly taken from her. The "Ostend Manifesto" produced a mild sensation, and might have produced a much greater one, had not another measure shortly after claimed public interest.

The presidential nominations in 1852.

The slavery question has carried us a little in advance of the regular order of events. In 1852, the Whigs nominated General Winfield Scott, the foremost military leader in the country. The party pledged itself to support the compromise measures of 1850, and to oppose the slavery agitation, but a good deal of that agitation was and had been for some time in its ranks, so that the sincerity of these pledges was distrusted. Moreover, as has been explained, it was impossible to rally popular enthusiasm around Scott, despite his fine military record.

The Democrats were at odds for a long time, the strife for the nomination being among Cass, Douglas, and Buchanan. None was strong enough to defeat the other two, and thirty-five ballots were fruitless. Then the Virginia delegates presented the name of Franklin Pierce, and most of the other delegates responded with the question "Who is he?" Before anything like an enlightening reply could be made, he carried the convention by storm and was nominated on the forty-ninth ballot.

Who was Franklin Pierce? He was a native of Hillsborough, New Hampshire, where he was born November 23, 1804. At Bowdoin College, he was a classmate of Longfellow and Hawthorne, he and the latter becoming intimate friends. He was a successful lawyer, a member of the State legislature, a congressman, and United States senator. He declined a cabinet appointment from President Polk, and being interested in military matters, volunteered his services in the Mexican War. He reached the command of a brigade, served with credit, but attained no special distinction. He died October 8, 1869.

Presidential election of 1852

Another candidate was John P. Hale of New Hampshire, "Free Democrat," representing what was left of the Free Soil party. Massachusetts cast a few votes for Daniel Webster, even though he died in the month before election, but neither he nor Hale received any electoral support. Pierce defeated his former military chief by an electoral vote of 254 to 42. The Whigs never again nominated a President under their party name.

The slavery controversy had become the one all-absorbing theme before the country. The majority were wearied of the seemingly endless quarrel with its increasing virulence, and the election of the Democratic nominee was largely due to the general belief that he would do more to soothe the passions of the two sections than his opponent. President Pierce chose a strong cabinet, and made the record never made by a predecessor, nor, thus far by a successor, of keeping it unchanged to the close of his term. The able William L. Marcy, of New York, was Secretary of State; James Guthrie, of Kentucky, Secretary of the Treasury; and Jefferson Davis, of Mississippi (afterward President of the Southern Confederacy), Secretary of War.

Had Cuba been annexed by the United States, it would have been with slavery, and would have served as a counterpoise to the large additions of free territory lately obtained, but a diversion in favor of slavery was suddenly made, not by a southerner, but by Senator Stephen A. Douglas of Illinois, who was a native of New England. He was a keen, aggressive stump speaker, who had been a member of the Illinois legislature, attorney-general, Secretary of State, and a judge of the supreme court. After serving in the House, he entered the Senate in 1847 and remained until 1861. He speedily reached prominence as one of the most brilliant and influential of Democrats. His large head and short stature led to his being nicknamed "The Little Giant." He was presented to the convention in 1852 and 1856, and, as we shall see, he received the nomination of the northern wing of his party in 1860.

Senator S. A. Douglas.

Senator Douglas, like all intelligent Americans, gave much study to the slavery question. It seemed to him that the true remedy for the eternal wrangling about the Territories was to place the matter wholly in the hands of the people of those Territories. Whose views were entitled to so much weight? When there were enough inhabitants to authorize admission into the Union, what could be fairer than to allow them to decide whether or not they should have slavery? Such authority would be the application of the principle of "local option," which many regard as the best panacea for the evils of intemperance. The theory of Douglas was "squatter sovereignty," and when he propounded it he startled the nation. The principle sounded so reasonable that it gained many adherents, though others opposed because of its inevitable outcome if carried to its legitimate conclusion. It would repeal the Missouri Compromise, and make it possible for slavery to obtain a foothold in territory from which it was supposed to have been excluded forever. Some of the southern statesmen had always maintained that the Missouri Compromise was unconstitutional, for it was inconsistent that Congress should be forbidden to interfere with slavery in the States, and yet be allowed to do so in the Territories.

Squatter sovereignty.

The Kansas-Nebraska bill.

Squatter sovereignty, therefore, was ardently accepted by the South, and hotly opposed by a majority in the North. Senator Douglas was chairman of the Senate Committee on Territories, and in January, 1854, he brought in a bill for the organization of the Territory of Nebraska which at that time included

the present States of Nebraska, Kansas, North and South Dakota, and all of Colorado, Wyoming, and Montana lying eastward of the Rocky Mountains. This enormous expanse is entirely north of 36° 30′, and from it, therefore, slavery was excluded by the Missouri Compromise. Since the bill of Senator Douglas provided that the settlers of the two Territories should decide the question of slavery for themselves, it must, if it became law, repeal the Missouri Compromise, as has been already stated.

The discussion in Congress became violent, and several personal collisions took place. The disruption of the leading political parties was foreshadowed when many of the northern Democrats and four Democratic senators refused to follow Douglas. The bill was passed, and went into effect May 31, 1854. It was followed by a jumbling of political parties, and a rearrangement, in which the northern Whigs and Democrats, and those who were determined to oppose the further extension of slavery, fused under the name of "Anti-Nebraska men." The Democrats became more distinctively southern, and were joined by the pro-slavery Whigs, many of whom were in the South and a considerable number in the North.

Repeal of the Missouri Compromise.

The result of this overturning or re-casting of political parties was the formation of the present Republican organization. Because of its strength and prestige the facts attending its birth are interesting. The dissatisfaction with the increasing evil of slavery led many political leaders, mostly Congressmen, to issue a call for delegates to attend a convention in Pittsburg, to be held in February, 1856.

Formation of the Republican party.

This call was ardently responded to, and on the day set for the meeting there came together in Lafayette Hall — since taken down — a goodly number of Whigs, Democrats, Free Soilers, and Know Nothings, with Horace Greeley, the distinguished editor of *The Tribune*, the dominant personality. Several prominent men had written out their ideas of the proper platform, but the views of Greeley prevailed. These were that the enunciation of principles should be brief, plain, and ringing, and should consist of three planks,— opposition to the extension of slavery in the Territories then free; homesteads free to actual settlers in the public domain; and favoring the building of a railway line across the continent. This platform having been adopted, a committee was named to call a national convention for the purpose of nominating candidates for the presidency and vice-presidency. The convention was called for Philadelphia, June 18.

Nebraska lay so far north of the zone of slavery agitation that it had not a ripple of trouble, but Kansas was turned into a pandemonium. It was on her soil that the opening volleys of the war for the Union were fired, and the armed forces of slavery and freedom met in deadly grapple. Hitherto pioneers had gone into a new country to settle, in peace, if possible, and to build up homes for themselves; now, they rushed into Kansas to fight others hurrying thither, equally eager to fight and keep them from gaining control.

Directly to the east, with the borders touching, was the great slave State of Missouri, from which hordes swarmed into Kansas, carrying guns in one hand, and, figuratively speaking, ballots in the other. At some of the farcical elections the majority for slavery was five times greater than the number of legal residents. The pro-slavery men were fired by the thought that here was to be the real battle-ground between them and the "Black Republicans," and they would stop at no means for overthrowing the execrated invaders.

"Bleeding Kansas."

Nor were the friends of freedom idle. They were determined that Kansas should be free, and they hurried emigrants into the region. Societies were organized in the North, and abundance of funds provided for furnishing the bands of lusty young men with a Bible and Sharp's rifle apiece. The premiums thus offered kept the tide steadily flowing westward, and Kansas broke into civil war. The traveler riding over the plains at night would probably see in the distance a glare of light in the sky, with perhaps another to the right, to the left, and it was not impossible that, if he glanced to the rear, he would have observed a similar lighting up of the heavens. He could not mistake their meaning: bands of pro- or anti-slavery men, were giving expression to their sentiments as regarded those who held differing views. The nearer tramp of horses' hoofs, and the reports of rifles and revolvers, might indicate that the opposing factions had come in collision on the prairie and were pushing the argument to a conclusion.

The outrages were not confined to either side during the civil war in Kansas. The Missourians and Arkansans were called "border ruffians" and deserved the name, while some of the free-state men were not much behind them. "Old John Brown of Ossawatomie" — who was soon to figure in a more sensational episode — received his training in sanguinary Kansas. He and his equally fanatical sons had suffered wrongs, and revenged themselves one day by murdering five pro-slavery settlers, — a crime for which no palliation can be offered, except the plea that the author was partly irresponsible. His resolute sons were simply tools in his hand and shrank from no deed which he demanded of them. He was a stern, uncompromising bigot, into whose warped brain, gradually germinated the belief that he was to be the instrument of heaven for stamping out slavery on the American continent.

Kansas could not fail to be a thorn in the side of the administration. Within the space of two years, three men, Reeder, Geary, and Walker, were successively appointed governor, and each went thither with pro-slavery sympathies, only to find that the warring factions were irreconcilable, and to resign the office in disgust. Three more governors tried their hands, with no better success, during the three following years. The free-State men founded the town of Lawrence on the Kansas, and the pro-slavery settlers established Atchison on the Missouri. Each faction set up its own government, one formally adopting slavery, and the other repudiating it, with an application to Congress to be admitted as a free State. Let us conclude the history of this woful period by saying that the northern settlers acquired such a preponderance of numbers, that the ground was surrendered to them in 1858. Civil strife ceased, but Kansas was not admitted as a State until January 29, 1861.

Admission of Kansas as a free State.

The civil war in Kansas had its echo in Congress where more than one digraceful affray occurred. As a rule, the Republicans controlled the House and the Democrats the Senate. Members glared at one another, when they met on the street, many carrying knives and pistols and prepared to use them, on a moment's notice. Not only that, but some did use them, and the air was full of threats to appeal to the "code," which had not yet fully lost its attraction in a few quarters, as the best method of settling a "difference" between gentlemen.

Kansas in Congress.

Senator Charles Sumner of Massachusetts made a two days' speech in May, 1856, in which he depicted in powerful language "The Crime against Kansas." This was proper enough, but some of his allusions to Senator Butler of South Carolina were unwarranted. When Representative Preston Brooks, a nephew of Butler, read the speech he was filled with uncontrollable rage, and hurried over to the Senate chamber to chastise the author. The Senate had adjourned, and Sumner sat writing at his desk. Brooks proved his cowardice by attacking Sumner, who he knew was always unarmed, and whose position made it impossible for him to defend himself. Brooks furiously belabored him with his cane, and in his frantic attempts to rise, Sumner wrenched his desk loose and fell senseless to the floor. The subserviency of Congress to

The assault on Senator Sumner.

the slave power was shown by its defeat of the resolution to expel Brooks for his act. He resigned and went back to his district in South Carolina which re-elected him with hardly an opposing vote. Sumner suffered greatly from his injuries, and was obliged to go to Europe, and submit himself to a delicate surgical operation, in which the spinal marrow was laid bare and burned. He was not able to return to his seat in the Senate until the end of three years and never fully regained his health, though he lived until 1874.

Mention must be made of a political party, which attained a mushroom prominence about this time. One of the grave problems now confronting our country is the regulation or control of the foreign immigration to our shores. In 1820, this was 8,385; in 1830, 23,322; in 1840, 84,066; in 1850, 369,986, and in 1903, 857,046. The total immigration, since 1820, is more than 22,000,000, or one-fourth of our entire population at the present time. When we reflect that among these multitudes who are continually swarming across the ocean are thousands of desperate miscreants, and the avowed enemies of our government, we cannot fail to see the perilous menace to our country. The ratio of immigration, near the middle of the last century was less than at the present time, but it was sufficient to alarm many citizens. Suddenly secret lodges began springing up manywhere, and the organization which they represented increased with amazing rapidity. Their purpose was to check the facile naturalization of foreigners and prevent their election to political offices. They claimed to quote an expression of Washington as their favorite motto, "Put none but Americans on guard." When one member wished to learn whether a stranger belonged to the order, he asked the apparently nonsensical question, "Have you seen Sam?" To all inquiries from outsiders, the invariable reply of the member of the order was that he knew nothing. This, together with the fact that the full secrets of the organization were reposed only in the higher degrees, led to the name "Know Nothings," as applied to the party. They secured a large representation in Congress, and were strong enough in 1855 to carry the elections in nine States. Gradually its secret methods were abandoned and it took the name of the American party, many of whose adherents were in the South.

The "Know Nothings."

When the time arrived for making nominations for the presidency, the American party made Millard Fillmore its candidate; the Democrats chose James Buchanan and the Republicans John C. Fremont, who was their first national standard bearer. The Republican convention met in Philadelphia amid general enthusiasm and excitement. Thaddeus Stevens, afterward the famous Republican leader in the House, strongly favored Judge McLain, of Cincinnati, but he and the Ohio delegates yielded when the current set in favor of Fremont. Abraham Lincoln was in the convention, but attracted no special attention. His greatness was of later growth.

Presidential election of 1856.

There was much in the personality of Fremont to draw the masses to him. The fact that he was a native of Virginia, was educated in Charleston, South Carolina, and was the son-in-law of the great Senator Benton of Missouri, and had proved his belief in the "code," ought to have won him a considerable following in the South, as it undoubtedly would have done but for the one all-absorbing question of slavery.

John C. Fremont.

A romantic interest attached to Fremont's early years. He had served in the navy, but joined the engineer corps of the army, and before he was thirty years old (1842) began his career as a daring explorer of the West, penetrating the Rocky Mountains to the peak which bears his name. On his second expedition he reached the Utah basin, and forced his way through the passes of the Sierra Nevada. He was in that region when the Mexican War broke out, very probably in accordance with an understanding had with the government, which knew of the approaching hostilities. He and Commodore Stockton conquered California. Because he accepted orders from Stockton instead of General Kearny he was court-martialled, and in resentment resigned his commission in the United States army. Fremont conducted two more exploring expeditions, but they were on his private account. On one of them he and his command underwent frightful hardships and suffering, all their mules and many of the men freezing to death. A singular fact was that none of the veteran mountaineers and plainsmen withstood the rigors so well as Fremont himself. He served as United States senator from California for the short term, and, although he entered the military service of his country in 1861, failed to attain special prominence.

Buchanan received 174 electoral votes; Fremont, 114, and Fillmore, 8. The results of the election alarmed the South. Here was a new political party, whose avowed platform was the exclusion of slavery from the Territories, under whose banner the opposition to the institution had solidified to the extent of 1,341,264 votes in a total of 4,053,971. Was it not the handwriting on the wall?

The election.

James Buchanan was the only bachelor President thus far in the illustrious list, and to him belongs the distinction, not quite so unique, of having occupied public office throughout almost all his mature years. Born in Mercersburg, Pennsylvania, April 23, 1791, he was elected to the State legislature while still a young man; became a Congressman in 1821; minister to Russia in 1832; a United States senator in 1834, resigning the same in 1845 to enter President Polk's cabinet as Secretary of State; and Minister to England until 1856, when he was elected President. He died June 1, 1868.

The fifteenth President.

Before proceeding with our political history, let us glance at a number of occurrences of a different character connected with the administration of Buchanan. Three States were admitted: Minnesota, May 11, 1858; Oregon, February 14, 1859; and Kansas, as already stated, January 29, 1861. As long ago as 1680, Father Hennepin, a Franciscan priest, made his way down the Illinois with a party of fur traders, and then paddled up the Mississippi until they reached the great falls, which he named St. Anthony. This is the first recorded visit of white men to that region, which was included in the Louisiana purchase of 1803. St. Paul, the capital, was founded in 1838, and Minnesota Territory was organized in 1849. The most formidable tribe of Indians in the Northwest, the Sioux, ceded an immense area to our government in 1851. The attractive resources of the country drew many emigrants thither, and its settlement and development proceeded at a rapid rate. We have already learned considerable regarding Oregon, which was visited by Captain Robert Gray, of Boston, in 1792. He sailed for a considerable distance up the Columbia, which he named for one of his vessels. Little, however, was known of the country until Lewis and Clark returned from their exploring expedition across the continent. John Jacob Astor, president of the American Fur Company, founded Astoria in 1811, but the extension of his business, as we know, was checked by the War of 1812.

Admission of Minnesota, Oregon, and Kansas.

San Juan is a small island whose location gives it command of the narrow channel dividing British Columbia from the United States. It was naturally desired by both England and our government. The treaty of 1846 was so loosely worded that each country found ground for its claim, and the island was jointly occupied for several years. This fretted the Americans, who looked with growing dislike upon their military neighbors. General Harney commanded in Washington Territory, and sent some troops to reinforce the small number on the island. Learning of this the governor of British Columbia warned Harney that it must be stopped or he would

Settlement of the San Juan question.

land a force. Harney resented the threat, and refused to heed it. Matters reached a point where only a spark was needed to produce an explosion. At this critical juncture General Scott was sent thither. He proved the right man in the right place, and displayed the same tactful courtesy that helped so much to smooth the ruffled tempers of the Charlestonians during the nullification days of a quarter of a century before. He sent away the reinforcements, stopped work on the fortifications, and the British squadron saluted and sailed off.*

Before the country was spanned by its network of telegraph wires the project of extending a line under the Atlantic that should connect the Old and New World was a theme of general interest. Some capitalists were deterred by the prodigious difficulties which confronted such an undertaking, for the distance to be covered was about three thousand miles, and the ocean bed is broken by mountains and gorges higher and deeper than any upon land. Cyrus W. Field, a prominent merchant of New York, never lost his enthusiasm, and his persistent labor was finally crowned with triumph. The great achievement was accomplished on August 5, 1858. Through that immense stretch of wire, far down in the silent chasms of the deep, where the faintest ray of light never penetrates, across vast plateaus, over sharp mountain peaks and ridges, the tiny thread extended, bringing the two worlds in closer connection than ever before. When it became known that messages had flashed back and forth, that Queen Victoria and President Buchanan had exchanged greetings, the whole country was thrown into pleasurable excitement. The hideous phantom of slavery shrank for the time into gloom, and light, illuminations, and joy were everywhere, England joining as ardently as the United States in the celebration.

The first Atlantic cable.

It is impossible, however, for a great and complicated enterprise to reach perfection at the first bound. Defects are sure to appear, which time and pains are necessary to correct. The working of the cable began to grow feeble; by and by it failed to respond, and on the 4th of September became as mute as the Sphinx. None the less, the practicability of a submarine cable had been proved, and efforts were renewed, but success was not attained until July, 1866. Other submarine cables have been laid since then, so that the civilized world is in close touch, and may be said to touch elbows.†

While commercial panics and financial distress, like everything else, follow the law of cause and effect, human wisdom has not yet found the remedy for them, any more than it has found a panacea for all physical ills, though both are sure of being discovered in the no distant future. The many wars and disturbances in Europe meant prosperity for us, but this prosperity caused over production, and when peace came to the Old World, and the great army of consumers became producers, the reaction was felt on this side of the Atlantic. Thousands of shops and factories were closed, and the large cities were filled with idle multitudes, many of whom would have perished from starvation except for the organized means of relief and the charity of those better provided with the world's goods. The hard times of 1857, in some respects, were as stringent as those of twenty years before, but did not last so long. The resources of the United States are boundless, and though in a financial way, she may be distressed at long intervals, she never fails to recover, and to resume her career of prosperity that has made her the wealthiest nation in the world.

The hard times of 1857.

The Mormons have been a plague to us from the time the sect was founded by Joseph Smith, early in the last century. When they tramped across the mountains and founded the State of Deseret, they succeeded for a time in their purpose of getting beyond reach of all disturbance at the hands of the Gentiles. This, in the nature of things, could not last, for the meagre emigration westward was expanded to overwhelming proportions by the discovery of gold in California. The Mormons were insolent and defiant from the first, when the Territory was organized. President Fillmore had appointed Brigham Young as governor. At the conclusion of his term, President Buchanan made a Gentile his successor. The revolt against him was so threatening that it was necessary to send an armed force thither in 1857–58. The Mormons were not cowed, and a bloody collision was imminent, when a little clever diplomacy mollified Brigham Young, and the storm blew over.

A Mormon rebellion.

It has been said that some of the ablest statesmen in the land believed that the Missouri Compromise was unconstitutional, and that Congress had no more right to interfere with slavery in the Territories than in the States. Such was "Squatter Sovereignty." The Fugitive Slave law was constitutional, but it was so repellant to the moral sense of many communities in the North that it was defied, and a number of States passed personal liberty bills, which permitted a jury trial to every negro accused of being a runaway slave. Several States, with the hope of placating the South repealed these laws. The North maintained that slaves were persons held to involuntary servitude; the South insisted that they were chattels. Suppose a slaveholder from Richmond, Virginia, went to Philadelphia, taking one of his slaves with him as his body servant. Such was the unquestionable right of the Virginian. Furthermore, as he viewed the matter, his slave was as exempt from molestation as was his coat or hat or cane.

Conflicting views on slavery.

Now, this slaveholder could have no more constitutional rights than any other citizen of Virginia. If a score, or a hundred, or a thousand of his neighbors decided to make visits to Pennsylvania, each could take his servants with him, the assumption in every case being that this crossing of Mason and Dixon's line was only temporary, and that he intended soon to go back to his home. Suppose one of these slaveholders extended his northern visit to a month, or even longer, keeping up, by occasional returns, his citizenship in Virginia. Certainly his right to retain the ownership of his slave was as clear, as if his stay in Philadelphia lasted for only a few hours.

But this made slavery legal in Pennsylvania, whose constitution expressly prohibits it. A compromise, limiting slave ownership to the time necessarily occupied in passing through a free State, could not affect the principle involved. One minute's slavery in Philadelphia was in effect a century's acknowledgment of the legality of the institution. "The moment a slave places foot upon our soil," said the North, "in that same moment he becomes a free man." At the same time, if slaves were simply chattels or property, their owners were entitled to protection of such ownership in any and every State in the Union.

Here, then, lay the irreconcilable difference between the views of the slavery and anti-slavery men. Continual conflicts resulted, and persons were imprisoned for meddling with the rights claimed by the owners of slaves when passing through the northern States. These owners were persistent in such claims, and their opponents were equally persistent in their interference. In the inflamed state of public feeling scant space for forbearance and magnanimity was found on either side. The abolitionists were the extremists in the North, as were the "fire eaters" in the South. Both parties were disunionists, while the masses were loyal, and seemingly powerless to stamp

*This, however, left the ownership of San Juan unsettled. England and the United States set the good example of referring the question to the German Emperor for arbitration. His decision, rendered in October, 1872, was that the island belonged to the United States. Accordingly, the British withdrew a few weeks later.

†When the first cable was laid it was inclosed in rubber, and the projectors felicitated themselves that no insect would eat rubber. "That may be true," said a scientist, "but down in the ocean depth at this moment a lot of creatures are beginning to feel a longing for caoutchouc." When the defective cable was raised and examined it was found to be honeycombed.

out the firebrands that threatened to involve the whole country in one appalling conflagration. Robert Toombs, of Georgia, boasted that he would call the roll of his slaves from the foot of Bunker Hill monument, and the North replied that if the South dared to raise a hand against the Union she would march one of her regiments from Mason and Dixon's line to the Gulf of Mexico, and whip all the rebels into submission. How wofully each section mistook the temper and courage of the other!

An army surgeon in Missouri owned a slave named Dred Scott. In the course of his duties the surgeon was ordered to a post in Illinois. He went thither in 1834, taking his slave with him, and remained for four years. His next station was at Fort Snelling, in Minnesota, from which slavery was excluded by the Missouri Compromise. Dred Scott married, and after a time accompanied his master back to Missouri. Thus an interesting question was presented. Scott had lived a number of years in Illinois and Minnesota, both States in which slavery was illegal. His friends maintained that this residence outside the jurisdiction of slavery made him a free man, and the crossing into Missouri could not transform him into a slave, any more than it could in the case of an African who had been born and reared in the North. Scott personally amounted to little as a servant. One day his master punished him. Scott, on the ground that he was a free negro, brought suit for damages in a case of assault and battery. The suit was appealed from one court to another, and, in one instance, a verdict was rendered in Scott's favor. Finally the appeal reached the United States Supreme Court, that of last resort. Chief Justice Taney and five of his associates (four of whom were slaveholders like himself) rendered their decision in the same week that Buchanan was inaugurated President.

The Dred Scott case.

The points upon which the highest tribunal in the land passed judgment were: Was Dred Scott a citizen who had the right to sue in a United States court? Was he made free by his residence in territory from which slavery was excluded by the Missouri Compromise? These vital questions were thus answered: No slave or his descendant could be a citizen of the United States. Scott was therefore put out of court. As to the second question, the Court said: "No word can be found in the Constitution which gives Congress greater power over slave property than property of any other description." It followed as a corollary that the Missouri Compromise "is not warranted by the Constitution, and is therefore void." The assertion often heard that this historical decision declared that a slave had no rights which a white man was bound to respect, is incorrect.

Thus the compromise which held civil conflict in abeyance for nearly thirty years was unconstitutional from the beginning. The decision was equally fatal to Douglas's "squatter sovereignty." Slavery was legal in every Territory until it blossomed into a State, and decided the question for itself. Since also a slave owner could take his slave into any State, without losing ownership of him, the institution was made legal on every foot of soil of the United States. It need not be said that this decision delighted the South and incensed the North.

Stephen A. Douglas would not admit that his principle of "squatter sovereignty" was demolished by the Dred Scott decision. His senatorial term being near its end, he began a personal canvas for re-election. The Republicans nominated Abraham Lincoln of Illinois, and the two agreed to hold a number of joint meetings in the summer of 1858. Douglas and Lincoln had been and still were warm friends, but the canvas was a battle of giants and attracted national attention. For the first time, the country learned that the uncouth "rail splitter" of Illinois was a genius such as is hardly seen in a generation. His speeches were masterly, his wit brilliant, his statesmanship of the highest order. As a politician, too, his shrewdness was unsurpassable. Douglas had a devoted following in the North and many admirers in the South. His ability was great, and he was looming up as a formidable presidential candidate in the approaching election. In the course of this historical debate, Lincoln drew from his opponent several admissions regarding squatter sovereignty, which made it impossible for Douglas to retain the support of the South. Lincoln was clear, frank, and eloquent in expressing his own views, and thousands of Republicans who were looking around for their standard bearer, said "He is the man!" The gallant fight which Douglas made against slavery in Kansas was worthy of all praise, and won him re-election to the Senate, but the words Lincoln compelled him to utter in the course of their debate, made his election to the presidency impossible.

The Lincoln and Douglas debate.

Whenever there is a rash thing to be done, a fanatic is sure to come promptly forward and do it. He now appeared in the person of John Brown, whose prominent part in the Kansas troubles has been mentioned. His unquenchable hatred of slavery and the insane whim that it was his mission to uproot the evil in the United States led him to act the part of a madman. He determined to rouse the slaves of the South to revolt. Had success been possible the consequences would have surpassed in awfulness the reign of terror in Paris during the bloodiest revolution of modern times. It must always be borne in mind that in this diabolical attempt, John Brown and his immediate followers stood alone. His purpose was as horrifying to the Republicans as it was to the South itself.

John Brown's raid.

Brown fixed upon Harper's Ferry, between Virginia and Maryland, as the point where he would pierce the shell of slavery. His sons and a few other fanatics were under his hypnotic spell, and obeyed his commands like so many children. He had left Kansas in the summer of 1859 and settled on the Maryland shore, opposite Harper's Ferry. He and his men kept their secret well, and their stealthy preparations roused no suspicion. He had about twenty followers, who on Sunday night, October 16, made their way like so many phantoms, across the railroad bridge, and, before any one suspected their purpose, they had taken possession of the Federal armory. When several citizens displayed some curiosity as to their movements, they were made prisoners. The telegraph lines were cut, and all was ready to apply the torch, whose flames were to sweep to the Gulf.

Brown left no doubt of his grim earnestness, and his utter disregard of consequences. When citizens dared to disobey his command to fall back, he fired upon them. Several were thus killed, before the town understood what the strange invasion meant. Then there was no hesitation on the part of the Virginians, who, snatching up such arms as were at hand, attacked the ruthless band. They fell back, and taking refuge in an engine house, held their assailants at bay throughout Monday and the succeeding night. The break in the telegraph line was speedily repaired and the startling news flashed to Washington. President Buchanan despatched Colonel Robert E. Lee, and a force of marines and land troops, who reached the spot early Tuesday morning, and besieged Brown in the engine house. He answered the summons to surrender with rifle shots, and Lee ordered the door to be battered down, during which the defenders killed one of their assailants. Not until two of Brown's sons had been shot and himself wounded a number of times, could the grizzled old fanatic be overpowered. The enraged mob would have given him and his companions short shrift, had not Colonel Lee protected and delivered them to the authorities. They were seven in number. Ten had been killed during the fighting, several while trying to escape. The Virginians naturally refused mercy to such men, and when any one of them, driven to the wall, offered to surrender, he was shot down without parley. Five of the citizens had lost their lives and the

whole South was inflamed by the occurrence, which was telegraphed to every corner of the country.

Brown and his men had committed a crime, that was widely condemned throughout the North, and which, as has been shown, would, in the event of success, have brought the most woful consequences to the country. The prisoners were placed on trial, found guilty, and the seven hanged on the 2d of December. Even his accusers could not withhold a certain respect for the calm heroism with which John Brown met his fate. There was no shrinking on his part, and he walked to his doom with the unflinching steadiness of the martyr who pities his persecutors, because they are unable to comprehend the divinity of his mission.

Execution of Brown and his followers.

The effects of this raid were baneful to the last degree. Congress assembled directly after the hanging of Brown. The testimony elicited during his trial and by the Senate investigation, proved that Brown, as has been stated, was almost wholly alone in his mad undertaking, no public man being implicated. It required two months to elect a Speaker, the Republicans succeeding in the end. On the floor of Congress, and by the leading papers of the South, the threat was repeatedly made that the election of a Republican President would be followed by the breaking up of the Union. This doubtless was bluster in many instances, made with a view of scaring the North, but a formidable minority soon proved they were in earnest.

Threats in Congress and by the southern press.

We have given a glance of the alarming state of public sentiment when the time arrived for the presidential nominations of 1860. The Democratic delegates met in Charleston in April, and immediately plunged into a bitter wrangle. The majority were in favor of Douglas, insisting that he was the only man whom they could elect. He certainly was the most available candidate, but it is an interesting question whether the South really wished to elect a candidate. It has been asserted by many able judges of events that its leaders foresaw that political defeat at the best could only be postponed, and it was best that the dispute should be fought out without more delay. Be that as it may, the action of the southern Democrats lent color to the truth of the charge.

Regarding the candidacy of Douglas, the extreme southerners were vehement in their declarations that they would support no candidate holding the views of Douglas regarding slavery (Here the fine hand of Abraham Lincoln in 1858 showed itself.), which must be *protected* in the Territories by Congress against unfriendly legislation. These views were irreconcilable, and after 57 ballots the convention adjourned without effecting a nomination, to meet in Baltimore in June. There a secession of delegates took place, and those that remained nominated Stephen A. Douglas of Illinois, and Herschel V. Johnson of Georgia, for President and Vice-President. The extreme southern delegates met in Richmond, and nominated John C. Breckenridge of Kentucky, and Joseph Lane of Oregon. Then delegates of the "Constitutional Union" party came together in Baltimore and nominated John Bell of Tennessee, and Edward Everett of Massachusetts. The platform of the last named was so vague, though well meaning, that it could not attract much support.*

Split in the Democratic ranks.

In the week succeeding the nomination of Bell and Everett, the Republican convention met in Chicago (May 16). Senator William H. Seward of New York was the choice of a large number, and it cannot be denied that in some respects he was the ablest man in the party. He had been governor of the Empire State, and had long stood in the front rank of the statesmen of the Republic. But not only had the debates with Douglas stamped Abraham Lincoln as one of the greatest of men, but he had steadily grown in the admiration and respect of his countrymen. The nomination, therefore, went to him, with Hannibal Hamlin of Maine, as the choice for Vice-President. At the November election Lincoln received 180 electoral votes; Douglas, 12; Breckenridge, 72, and Bell, 39.

Presidential election of 1860.

So the final issue was presented. A Republican President of the United States was elected by a legal plurality of nearly half a million votes. Would the South carry out her threat of seceding from the Union? She had been taunted by the North, during the excitement preceding and following the election, with the charge that she had not the courage to take the step, and that if she did she would be speedily whipped into submission. She replied by passionate declarations that she would not hesitate. Had an untrammeled vote been taken throughout the southern States, it is almost certain that every one, with the exception of South Carolina, would have given a strong majority against secession. There was a deep underlying sentiment of loyalty among the masses, hallowed by the memories of the Revolution, the War of 1812, with Mexico, and in other struggles, when northerners and southerners stood shoulder to shoulder, and the sufferings, perils, and achievements of one were the glory of both and freedom the heritage of all. But the extremists of each section were inspired by an enmity which drove the country toward civil war, and no human power or wisdom was sufficient to check the rush to destruction.

Active and latent loyalty in the South.

South Carolina did not wait long to prove she was in deadly earnest, when she declared she would never submit to the rule of a Republican President whose election was due to the votes of one section. Lincoln had carried every free State, excepting New Jersey, which divided her electoral vote; Breckenridge swept the southern States, excepting Missouri, which gave a majority for Douglas, and Virginia, Kentucky, and Tennessee, which supported Bell. The Democrats were in the majority in both branches of Congress, and the President would be Democratic until March 4, 1861. Some of the greatest statesmen in the South combated the project of secession. Among them was Alexander H. Stephens, of Georgia, whose appeal to the legislature of his State was such a masterpiece of logic and eloquence that President-elect Lincoln thanked him in a letter, and invited him to become a member of his cabinet. South Carolina was deaf to all appeals, and called a convention to meet on December 17, to arrange for the withdrawal of their State from the Union. Her senators, representatives, and Federal office holders, had resigned immediately after the election of Lincoln. The convention in Charleston passed the ordinance of secession on the 20th, followed by scenes of excitement rarely seen in the history of that city. The church bells were rung; horsemen dashed through the streets, waving their hats and shouting the news; everybody wore a secession cockade; women and children joined the men in singing secession songs; the governor, officials, and public men made burning speeches from the balconies of the hotels and their residences to cheering thousands; salutes were fired, and the city brilliantly illuminated at night. All were made crazy by the vision of future prosperity and glory that were to come to them, now that they were freed from the tyranny of a hireling government. In looking back through the vista of years to those delirious days we wonder that men could have been so blind, and yet who of us can say that had he been a native of South Carolina, and in her capital at the time, he would not have joined the shouting throng?

Secession of South Carolina.

Has a State the right to secede from the Union? The Constitution was silent on the point, and the ablest minds in the country differed. A vast ma-

*Soon after Bell's nomination he alienated many of his friends by a public speech, in which he uttered secession sentiments. When an explanation was demanded, he tried to justify himself on the plea that he was intoxicated at the time, to which a leading paper replied that when a man is intoxicated his moral restraint is removed, and he acts out his real nature. It is certain that the head of the Constitutional Union ticket could bear no comparison with its tail.

President Buchanan's views.

jority, however, believed the league of the States was indissoluble, and among these believers were and had been some of the foremost southerners. The question must now be answered for all time. A State had seceded, and the national government must act.

President Buchanan, in his message to Congress before South Carolina had withdrawn, but when it was certain she would do so, said that he regretted that he should be called upon to question the right of a State to secede, since no authority could be found for preventing such action. The North was naturally angered by this declaration of the Chief Executive, for it could not have been clearer in its justification of secession. The anger of the North would have been deeper, had it known that this message of the President had been first read and "approved" by Jefferson Davis and other leading disunionists. (Such is the statement of Jefferson Davis himself).

President Buchanan was a Union man, but he was honest in his belief that the government had no authority to prevent the secession of a State. Abler minds than his have held the same view. Buchanan was timid, and looked with dread upon the crisis that was bearing down upon him. One amendment to the Constitution, could it have been effective at that time, would have pleased him: that was that his term should end several months prior to March 4. Attempts have been made to demonstrate the statesmanship displayed by the President during those trying days, but nothing is clearer than the weakness of this old man of threescore and ten, who was unequal to the task placed upon his shoulders. Moreover, Howell Cobb, his Secretary of the Treasury; John B. Floyd, his Secretary of War; and Jacob Thompson, his Secretary of the Interior, were ardent secessionists, who made every effort to strengthen the South for the approaching struggle. Buchanan was dominated by the slave interests, though it is to his credit that he did not go as far as they demanded, and he heeded at times the thunderous voice of an outraged North.

Timidity of the President.

During the stormy days of the past, the cure for such crises was compromise. Congress turned to it again, and it seemed as if nearly every member had formulated a scheme that would dissipate the clouds and bring lasting quiet to the country. "Peace conventions" were held in most of the States and good and true men anxiously consulted and strove to find a way out of the valley of despair. The compromise which drew general attention and promised the most was offered by Senator John J. Crittenden of Kentucky. It proposed an amendment to the Constitution, which would extend the Missouri Compromise line to the Pacific and prohibit Congress from interfering with slavery south of that line. All fugitive slaves rescued from United States officers were to be paid for by the Federal government. Among the many compromise schemes offered, this was regarded with the most favor in the North, not by Republicans alone, but by Democrats, and by no inconsiderable number of the latter in the South. Even Senator Seward was inclined in its favor.

Compromises.

There was one man, however, who saw things with a clearer vision. Abraham Lincoln at his home in Illinois was in constant correspondence with Republican leaders, and with those who, while entertaining different political views, were able and patriotic. He summoned many to Springfield for consultation. To all such, after hearing their views, he said in substance: "The time for compromise is past; to compromise further, only postpones the inevitable conflict; a partial yielding to the demands of the slaveholders encourages them to demand more; moreover, the concession you propose will not be accepted by them." His views prevailed and the Senate rejected the Crittenden Compromise.

Rejection of the Crittenden Compromise.

It would seem that, as it was self-evident that the country could not exist with one-half slave and the other half free, there was only a single peaceable solution of the momentous question: that was for the South to emancipate its slaves, the national government paying therefor. True, this would have required a stupendous sum of money, but it would have been less than the value of the million lives that it cost to restore the Union.

Virginia asked that delegates to a peace conference should assemble in Washington, in February, 1861. The request from a State that had been the leading one for two centuries, that had been foremost in brave and noble deeds, the mother of Presidents, and of Washington, could not be disregarded. The hope that a solution of the terrifying problem would be reached was general throughout the country, and delegates went to Washington from fourteen free States and from Virginia, North Carolina, Tennessee, Kentucky, Maryland, Missouri, and Delaware, the total being substantially two-thirds of all the States of the Union. The prestige of the Virginia Peace Convention was added to by the fact that John Tyler, ex-President of the United States, now an old man, was the presiding officer. The conference spent several days in earnest discussion, and formulated several concessions to the slaveholders, which were submitted to Congress and all rejected. In their place, that body passed the amendment of Senator Douglas, pledging that Congress should never meddle with slavery in any of the States. The rushing events of the Civil War caused this soon to drop out of sight.

Peace conference in Washington.

There were plenty of "fire eaters" at the peace convention, one of these when asked upon what terms the South would remain in the Union, replied: "If you should give me a blank sheet of paper, with liberty to dictate the terms, I could not name them; we are resolved upon secession and no power on earth can prevent it."

It has been noted that South Carolina sent no delegates to this historical Peace Conference. Had all the other southern States refused to follow her, she would not have turned back or rescinded her secession ordinance, passed a few weeks before. In truth she went forward with headlong energy, as if she were to make the great fight alone. Measures were set on foot to establish an independent government, but the most persuasive of agents were sent to the sister States of the South, and their success in winning support was marked. Before the close of January, 1861, Mississippi, Florida, Alabama, Georgia, Louisiana, and Texas passed ordinances of secession. They sent delegates to Montgomery, Alabama, where, on the 4th of February, 1861, a provisional government was established with the title of "The Confederate States of America." Jefferson Davis and Alexander H. Stephens were elected respectively President and Vice-President, and were unanimously re-elected on the 6th of November following. The Confederacy was soon after joined by Virginia, North Carolina, Tennessee, and Arkansas.

Secession of other States.

The "Confederate States of America" organized.

The mistake made by the South was in believing the North would not fight, and that, if it did so, thousands of its citizens would give active aid to the South. There were many southern sympathizers in the North, who made threats. There were a large number of Unionists also in the South, but both parties were swept off their feet by the opposing torrents, and the first clash of arms unified each section.

Mistakes of the South.

Another broken reed upon which the South leaned was the hope of its recognition as a government by England and France, with a probability of intervention on the part of one or both. There were grounds for such hope. Both of the governments named would have been glad to see the Union destroyed. The enmity of the Emperor Louis Napoleon was virulent, and he urged England to join him in recognizing the Southern Confederacy. That England did not do so was largely due to the staunch friendship of the noble Queen who presided over her destinies

fortunately throughout the longest reign in her history.

President Buchanan having said he had no authority to prevent the secession of a State, could not be expected to try to do so, when they began slipping out of the Union. Whenever one of them formally seceded, its senators and representatives left Washington and went home. Often the partings were impressive, and many a strong man was affected to tears, when the farewells were uttered. Some of the northern members as they shook hands with those whom they had learned to respect and love, met them next time on the battle field; the majority never saw each other again in this world.

Fort Pickens and Fort Sumter.

Acting upon the principle that the secession of a State was final and irrevocable, those that had gone out of the Union seized the forts, arsenals, post offices, custom houses, and national property within their limits, and the Washington government made no objection. All, however, did not go smoothly with the Confederates. When Lieutenant Slemmer at Pensacola was ordered by his superior officer to surrender Forts Pickens and McRae, he refused, and, withdrawing with his small force to Pickens, successfully held it until reinforced. Major Robert Anderson with a few troops garrisoned Fort Moultrie in Charleston harbor. All his communications with the national government had to pass through secession hands, and he knew that for the time he could get no assistance there. On the night of December 6 he secretly removed his troops to Fort Sumter, a much stronger position.

About this time President Buchanan showed a degree of firmness which was as grateful as unexpected to the friends of the Union. The disunion members of his cabinet having resigned, he replaced them with Joseph Holt, Secretary of War; General John A. Dix, Secretary of the Treasury; Jeremiah S. Black, Secretary of State; and Edwin M. Stanton, Attorney-General. Although all these men were Democrats, they were as fervent patriots as the Japanese. Each possessed great ability, and they exercised a wonderfully tonic effect upon the administration. The President, after long deliberation, was persuaded that it was his duty to send provisions and supplies to Major Anderson, who badly needed them, and who had applied for such succor. Accordingly, 200 men and supplies sailed for Charleston on the unarmed steamer *Star of the West*. The Confederates had been promptly notified by their friends in Washington of the intention of the government, and had erected batteries and fortifications at Charleston. On the appearance of the steamer she was fired upon, January 9, and compelled to return to New York. This date, therefore, marks the beginning of the Civil War.

Strengthening of the cabinet.

The steamer *Star of the West* fired upon.

In 1790, when the first census of the United States was taken its population was 3,929,214; in 1860, it had grown to 31,443,321. In 1790 the relative population of the free and the slave States was nearly the same; in 1860 that of the free States was about two and a half times greater than of the slave States, including nearly 4,000,000 slaves. In wealth and resources the disproportion was still greater. Meeting on equal terms, therefore, it would seem that the defeat of the States in revolt was inevitable.

Comparative strength of the North and South.

But the South possessed several advantages. Her population, as a whole, were more military; they were better horsemen and more accustomed to the use of firearms. Above all, they were to fight a defensive instead of an aggressive war. The Federal government must transport immense armies to the South and overcome the Confederate armies. The property the latter had taken must be wrested from them. A long line of coast had to be blockaded, and the Mississippi, whose lower portion the insurgents were certain to seal, must be opened to the Gulf.

At the outbreak of hostilities Jefferson Davis boasted that it was given to him to pick his officer from the best in the United States army and navy While the truth of this boast cannot be admitted, since no abler leaders existed than those at the head of the Union forces, yet the Confederate armies were handled with masterly skill, and their officers rank among the foremost of any time. The Confederate soldiers were brave in the highest degree, and the same is to be said of the Boys in Blue. It could not be otherwise, for both were *Americans*.

The Presidents of the rival governments were natives of Kentucky, and there was only a few months' difference in their ages. Jefferson Davis was born in 1808, and was graduated from West Point in 1828. He served in the Black Hawk War, in which Abraham Lincoln was enrolled as a captain, though he did little in the way of soldiering. Promotion in the army was not rapid, and Davis resigned his commission and became a cotton planter in Mississippi. His ability led to his election to Congress in 1845, but he resigned the following year, and was appointed a colonel. He won distinction in the war with Mexico, especially at the battle of Buena Vista, where his regiment captured the whole Mexican force that charged it. He was next chosen United States senator, and, as we recall, was Secretary of War under President Pierce, who said at the close of his term that, if he had to make the choice over again, he would select the same men. After the proceedings against him were dropped, in 1867, he removed to Memphis, and later to an estate that had been presented to him in Mississippi. He died in New Orleans, December 6, 1889.

The President of the Southern Confederacy.

As the years pass, the impartial judgment of history is that Abraham Lincoln was one of the greatest of men, whose rank is second only to that of Washington. Some make them equal. Washington in a human sense was the creator of his country, Lincoln the saviour.' The tasks of the two were widely different, but each displayed the same lofty patriotism, the same matchless knowledge of men, the same unfaltering faith in the cause for which he risked his life, the same consummate statesmanship which saw the end from the beginning; each was magnanimous, charitable and gentle hearted, but stern when need be; and in all things both acknowledged the aid and direction of a power above that of man.

The sixteenth President.

Abraham Lincoln was born in Hardin (now Larue) county, Kentucky, February 12, 1809. He was a small boy, when his parents removed to Indiana. They were as poor as they could be, and the lad saw the inside of a school house for only a few months. He toiled hard on the wretched farm, but used all his spare hours in reading instructive books, and in studying history and the ordinary school branches. He grew into a gaunt, awkward, homely youth, whom everyone liked because of his honesty, good nature, and accomodating disposition. He counted himself lucky, when sixteen years old, that he was able to earn six dollars a month by conducting a ferry across the Ohio. He had just reached his majority when his father changed his home to a cabin, on the fork of Sangamon River in Illinois. The son's arduous labors there earned him the name of the "rail splitter." With the aid of several friends, he constructed a flatboat, in which he carried a cargo to New Orleans. When the stubborn pigs refused to be driven ashore, he picked them up one after the other, and carried them squealing and resisting over the plank to land.

Lincoln showed an early interest in politics and in 1836 was elected to the State legislature, in which he served four terms. He became a Congressman in 1846, and steadily forged to the front among his political associates. His humor and wit were unfailing, and no woman ever had a tenderer heart. What higher tribute can be paid his memory than by the loving repetition of the name by which he became universally known,—"Honest Abe," for who shall

dispute the truth that "an honest man is the noblest work of God"? *

VI. The War for the Union.

Through all these trying days, with the skies growing darker, and the mutterings of Civil War in the air, Abraham Lincoln, the President-elect, remained at his home in Springfield, Illinois, in continual correspondence and consultation with not only Republican leaders, but with prominent men of other parties. He listened with earnest attention to their views, and spent hours in deep thought and meditation over the task that confronted him,—a task more tremendous than any predecessor had ever faced and with which he had ever grappled. He did not fail to supplicate the only One who could give him strength and wisdom in the great crisis. Days of fasting and prayer were observed in the different States, and there was hardly a pulpit in the land, or a family altar, from which prayers did not ascend for Divine guidance in the impending struggle, whose end no human eye could foresee.

The President-elect.

Amid the sorrowful farewells of his friends and neighbors, Mr. Lincoln left his home February 11, bearing with him the news of the formidable secession of the southern States, and the formation of the Southern Confederacy just one week before. He knew that when he took his seat in Washington it would be to face one-third of the country arrayed in armed rebellion against the authority of the national government. Since he was determined that this opposition should be crushed nothing could avert Civil War.

The President remained in Philadelphia on Washington's birthday to participate in the raising of a flag over Independence Hall. There he learned of a plot to assassinate him in Baltimore while on his way to Washington. Urged by those who had him in care he used an earlier train than the scheduled one, reaching the national capitol in the morning of the 23d. There was fear of a disturbance at the inauguration ceremonies, but General Scott's preparations were so thorough that everything passed off smoothly. The carefully prepared inaugural was read in the presence of the Supreme Court, both houses of Congress, and a brilliant array of foreign ministers and many leading American citizens. The President asserted that the United States is not a *league* but a *union*; that no State possesses the right of secession, and in accordance with his constitutional duty he intended to occupy all the places belonging to the government, and to collect the duties and imposts. He was clear in his declaration that he did not mean to interfere with slavery where it legally existed. Fort Sumter was the point toward which the eyes of the country were turned, and he declared it would be provisioned by force if necessary.

Arrival in Washington.

The inauguration.

President Lincoln had previously selected an able cabinet, consisting of William H. Seward, Secretary of State; Salmon P. Chase, Secretary of the Treasury; Simon Cameron, Secretary of War; Caleb B. Smith, Secretary of the Interior; Gideon Welles, Secretary of the Navy; Montgomery Blair, Postmaster-General; and Edward Bates, Attorney-General. In the course of the war the following changes took place: Secretary of the Treasury, Willaim P. Fessenden (1864); Hugh McCulloch (1865); Secretary of War, Edwin M. Stanton (1862); Secretary of the Interior, John P. Ushur (1863); Postmaster-General, William Dennison (1864); Attorney-General, Titian J. Coffey (1863 *ad. in*); James Speed (1864).

The cabinet.

After careful consideration of the question the government decided to send provisions and supplies to Major Anderson, commanding Fort Sumter in Charleston harbor. Washington swarmed with secession sympathizers and spies, who telegraphed every item of news to the Confederate government at Montgomery, Alabama. Jefferson Davis immediately ordered General P. G. T. Beauregard, in command at Charleston, to compel the surrender of the fort. Beauregard sent a summons to Anderson, which was refused. At daylight on the morning of April 12 the first gun was fired from Fort Johnson, to which reply was made at seven o'clock. This first gun in defense of the Union was discharged by Captain Abner Doubleday from Fort Sumter. The bombardment was slow, and was kept up for thirty-four hours, when, food and ammunition being exhausted, Major Anderson raised the white flag on Sunday, April 14.

Bombardment of Fort Sumter.

The news of the bombardment and surrender threw the North and South into the wildest excitement. President Lincoln called for 75,000 volunteers for three months, and more than double that number responded. The enthusiasm was equally ardent in the South. All hesitation vanished, argument ceased, and it seemed as if every Union man in that section was transformed at once into a disunionist. The sentiment in each section was unified by the fall of Fort Sumter.

The effect North and South.

It was evident that Virginia was to be the chief battle ground of the war. The Confederate capital was removed from Montgomery to Richmond, where its Congress was summoned to meet on July 4. This defiant action incensed the North. In accordance with the rule at such times the newspapers instructed the government how to conduct campaigns and manage affairs. The most influential journal raised the cry "On to Richmond!" and declared that the Confederate Congress must not be allowed to assemble there on the nation's birthday. Before the troops could be drilled and trained to an effective point. 30,000 of them, under the command of General Irvin McDowell, marched out from Washington to attack the enemy. The first real battle of the war was fought at Bull Run, near Manassas Junction, Virginia, on Sunday, July 21. Victory was in doubt for some time, but at the critical moment the Confederates were reinforced, and a panic spread among the unionists, who fled in headlong confusion toward Washington.

The first battle of the war.

This disaster, however, was the best thing that could have happened for the Union and the worst thing for the Confederacy. It gave the South an exultant confidence and made the North comprehend the gigantic task before it. Congress called for half a million volunteers and voted half a billion dollars to crush the rebellion. General George B. McClellan, known to be a fine organizer of troops. who had done dashing work in Western Virginia, was placed in command of the Army of the Potomac. He tried the patience of the North by spending the autumn and winter in training a magnificent force for service. There was skirmishing and indecisive fighting in the West, with the result that Missouri was prevented from joining the Confederacy.

The South had able men at the head of affairs, who saw the need of gaining supplies from abroad. It would be of great help if the European powers would recognize the Confederacy as an independent nation. Two commissioners, James M. Mason and John Slidell, were sent respectively to England and France to gain such recognition. When these commissioners were off the Bahamas, on the British steamer *Trent*, the United States steamer *San Jacinto*, under command of Captain Charles Wilkes, stopped the *Trent* and (November 8) took off the two men, who were carried to Boston and placed in Fort Warren. This was illegal, being in principle the cause of our going to war with Great Britain in 1812. When she

The *Trent* affair.

* Looking back through the lifting mists of seven eventful tragic, trying, glorious years, I clearly discern that the one providential leader, the indispensable hero of the great drama — faithfully reflecting, even in his hesitations and seeming vacillations, the sentiment of the masses — fitted by his very defects and short comings for the burden laid upon him, the good to be wrought out through him, was Abraham Lincoln.—*Horace Greeley.*

demanded the surrender of the prisoners, therefore, our government obeyed with the best grace possible. England gave much help to the South throughout the war. France was still more viciously friendly and Louis Napoleon kept urging England to join her in recognizing the Confederacy. She refused, partly through the friendship of Queen Victoria and a few others, and partly through the conviction that if she did so, a day of reckoning was sure to come to her. Russia was our only friend among the European powers during the War for the Union.

EVENTS OF 1862.

The task confronting the national government.

It took a year of disjointed fighting to show the North what she must do and to make full preparations for doing it. The military strength of the South was soon moulded into effective shape and handled by the masterly genius of General Robert E. Lee, who had under him those scarcely second to him in ability. The North had just as able leaders, but it took her longer to discover who they were and still longer to fit them into their right places. At the beginning, the South was better prepared, and the first year and more resulted in greater advantage for her, she being mainly on the defensive most of the time. The North was slower in getting ready, but when she did so her immensely superior resources made her irresistible. It will help to understand the work confronting the North by bearing in mind that a vast navy was needed to blockade the enormous line of seacoast; that the forts in the South had to be retaken; that the Mississippi, which the secessionists had closed, must be opened to the Gulf, and that her formidable armies had to be forced to surrender. It was truly a Titan task.

Operations in the southwest.

In the southwest, a fleet under the command of Commodore Foote and a land force handled by General U. S. Grant, captured Fort Henry on the Tennessee, February 6. Then Fort Donelson, near at hand, was forced to surrender with its garrison of fifteen thousand men, February 16. While the Union army was encamped at Shiloh, or Pittsburg Landing, it was furiously attacked by the Confederates, under Albert Sidney Johnston, April 6. Only by the most desperate fighting, did the Federals escape a crushing defeat. They were reinforced, Johnston was killed, his army retreated and Western Tennessee was gained to the unionists. At Perryville, October 8, the Union leader General Buell, defeated General Bragg and Kentucky was practically cleared of Confederate troops. The next great battle was at Murfreesboro which opened on the last day of the year. The struggle ending on January 2, 1863, was the bloodiest that had yet been fought, the killed and wounded reaching the awful total of nearly nine thousand men. Meanwhile, General Grant attacked Vicksburg, it being necessary to capture that post in order to open the Mississippi, but the close of the year did not see him successful.

The *Monitor* and *Merrimac*.

At the opening of the war, the Norfolk navy yard was burned to prevent its falling into the hands of the secessionists. They raised the steam frigate *Merrimac*, re-named her the *Virginia*, covered her with a sloping roof of railroad iron, daubed with grease, and fitted her with a formidable iron snout or prow. On March 8, she steamed slowly out from Hampton Roads, smashed in the side of the sloop-of-war *Cumberland* and sent her to the bottom. The *Congress* was compelled to surrender and then the *Merrimac* labored back to Norfolk, intending to return on the morrow and complete her appalling work of destruction. It was found that the heaviest broadsides glanced from her metal hide like so many hailstones.

That night the *Monitor*, the work of the Swedish inventor John Ericsson, arrived from New York. She also was an ironclad, but only a fifth the size of the *Merrimac*, and had a single turret and two guns which fired solid shot. She pluckily assailed the *Merrimac* when she returned and finally forced her to go back to Norfolk. This remarkable battle caused a revolution in naval warfare. The navies of the world to-day are composed of ironclads.

Other naval successes.

A powerful naval and land force captured Roanoke Island, February 8, Newbern, N. C., fell March 14, and Beaufort, April 25. On the last-named date, Captain Farragut's fleet having run past all the forts below New Orleans, received the surrender of the city.

Failure of the campaign against Richmond.

The greatest of the campaigns was that which was pressed against Richmond. General McClellan, with his splendid army of one hundred thousand men, landed at Fort Monroe in April and advanced toward the city. Yorktown was occupied May 4, and our troops approached to within seven miles of the Confederate capital. Then McClellan learned that the danger threatening Washington had compelled the recall of the reinforcements intended for him. His communications were also threatened and he began withdrawing from the peninsula. He was obliged to resist terrifically all the way, but finally reached Harrison's landing on the James, where he was protected by his gunboats. It was during this furious fighting that the wounding of General Joseph E. Johnston compelled him to give way to General R. E. Lee, who retained chief command to the close of the war. The campaign against Richmond had failed, but President Lincoln called for three hundred thousand more men and made ready to prosecute the war with greater vigor than ever.

First Confederate invasion of the North; Union repulse at Fredericksburg.

The Confederates were so jubilant that General Lee marched against Washington. General Pope was in command of the defenses, and his army was routed and scattered at Bull Run, August 29 and 30. General McClellan was again placed in charge and attacked Lee at Antietam Creek, near Sharpsburg, Md., where the bloodiest battle of the whole war was fought, September 16 and 17. It was indecisive and Lee recrossed the Potomac without molestation. McClellan's timidity wore out the patience of President Lincoln, who removed him and placed General A. E. Burnside in command. He made the most reckless of attacks upon the Confederate works at Fredericksburg, December 13. He received a frightful repulse, his killed amounting to more than twelve hundred, with eight times as many wounded.

EVENTS OF 1863.

The Emancipation Proclamation.

Immediately after the battle of Antietam, President Lincoln issued a proclamation declaring the freedom of all slaves in the States that were in rebellion on the 1st of January following. Thus it may be said four million human beings were liberated by a few strokes of the pen. We must bear in mind, however, that as a war measure, they were merely set free, and slavery was not abolished anywhere. The President had no power to do that.

Union defeat at Chancellorsville.

Burnside had made so horrible a failure at Fredericksburg, that he was removed and General Joseph Hooker placed in command of the Army of the Potomac. He attacked Lee, May 1–4, at Chancellorsville, but was routed. Lee hurriedly crossed the Potomac into Maryland, and then passed into Pennsylvania, with the Army of the Potomac in close pursuit. On the march, Hooker was superseded by General George G. Meade.

Battle of Gettysburg.

The two mighty armies came together at Gettysburg, where, during the first three days of July, was fought one of the most tremendous battles of modern times. The losses were appalling, and for awhile the fate of the Union trembled in the balance, but the Confederates finally gave way, and Lee retreated to Virginia, where he was not disturbed until the following spring.

Grant was still pressing the siege of Vicksburg and on July 4, it surrendered with its large garrison. Its fall compelled the abandonment of Port Hudson. This was a severe blow to the Confederacy, which was now split asunder, and the Mississippi was open from its source to the Gulf of Mexico. Two of the most decisive triumphs of the war had been gained.

Fall of Vicksburg.

In the southwest, General Rosecrans was fiercely attacked by General Bragg at Chickamauga, September 19 and 20. The Union army would have been annihilated, but for the heroism and generalship of George H. Thomas, commanding the left wing. Rosecrans returned to Chattanooga and Bragg followed, taking position on Missionary Ridge, Lookout Mountain and Raccoon Mountain, and besieged him. Reinforcements were sent forward, Grant placed in command and Bragg was driven out November 24.

Operations in the southwest.

Longstreet shut in Burnside at Knoxville, but retreated upon learning of the approach of Sherman. This gave east Tennessee to the unionists and opened the door to the heart of the Confederacy. Grant had proved himself the ablest general of the Union, and President Lincoln displayed his usual wisdom by bringing him east, where the most colossal work of all remained to be done. Sherman remained in charge in the southwest.

EVENTS OF 1864.

The war had now reached that stage in which there were only two formidable armies arrayed against the Union. The one in the southwest was commanded by General Joseph E. Johnston, and that in the east by General R. E. Lee. It may be said that the southern Confederacy rested upon the bayonets of the Army of Northern Virginia.

Forces of the Confederacy.

Generals Grant and Sherman agreed upon the final plan for crushing the rebellion and ending the war. Hitherto it had been the rule when one Confederate army was attacked for the others to reinforce it. This was comparatively easy, since the Confederates were fighting on inner lines, and the assaults of the Federals were rarely made at the same time at different points. They had larger armies in the field, and the resources of the North were practically without limit. The South was in the depths of poverty, her soldiers had dwindled in numbers, and she was fast growing weaker.

Grant's plan of the final campaign.

The Union plan of campaign was simple. Grant with his powerful Army of the Potomac was to attack Lee and keep it up without stopping. Sherman, at the same time, was to begin boring through the core of the Confederacy, and give its second army under Joe Johnston no rest. Thus neither he nor Lee could help the other, and the two Union hosts must in the end hammer each Confederate army into fragments. It was arranged that the general advance should begin with the month of May. Let us first follow that of Grant, who had been made lieutenant-general and placed in command of all the armed forces of the Union.

Advancing from the Rappahannock, Grant entered the dismal region known as the Wilderness. Lee was on the alert, and the fighting began almost at once. For days and weeks it was of the most furious nature. The slaughter was horrifying, but Grant persisted, continually flanking Lee and compelling him to fall back. When Grant reached the Chickahominy the Union losses had been more than three times those of the Confederates, who took position within the defenses of Richmond.

Advance of General Grant.

Grant speedily saw that these defenses on the north were impregnable. He therefore swung his army to the south and laid siege to Petersburg. At the same time he pushed to the westward, so as to close the railways which brought supplies to Lee. Thus matters stood at the end of the year.

Sherman's army was a third or fourth more numerous than Johnston's, and soon entered a country so fertile and rich that the invaders did not need to carry supplies. Several battles were fought at different points, but in July Sherman arrived in front of Atlanta. There Johnston was displaced by Hood, of much less ability, but a headlong fighter, whose rash attacks were repulsed with great slaughter. Hood was compelled on September 2 to abandon the city, and Sherman, having burned the depots and factories, faced toward the Atlantic, three hundred miles away. The tramp of five weeks was a gigantic picnic. The Union army cut a swath of desolation sixty miles wide "from Atlanta to the sea," destroying millions of dollars worth of property and laying bare the weakness of the Confederacy. It was another of the endless illustrations of the idiocy and horror of war.

Sherman's march to the sea.

Savannah was captured December 21, and Sherman spent the winter in Georgia and South Carolina, harassing the enemy whenever he could, and doing his utmost to cut off the supplies of the Confederate army. General Lee was placed over all the armed forces of the Confederacy, and one of his first acts was to restore General Johnston to command. The two former antagonists, therefore, again confronted each other.

We must not forget that there were stirring events on the water. The blockade could not be made rigid enough to shut out all the Confederate cruisers. At Wilmington, N. C., and Mobile they often seemed to enter and leave at will. They had so powerful a fleet of ironclads and armed vessels at Mobile that they boasted they would raise the blockade. Admiral Farragut bravely attacked the defenses August 5, and after a hard battle, in which he displayed the highest skill and bravery, he closed the port against any further blockade running.

Battle of Mobile Bay.

The most famous of the Confederate privateers was the *Alabama*. She inflicted enormous damage upon Union commerce, but in an engagement with the U. S. steamer *Kearsarge*, off Cherbourg, France, June 19, she was sunk. Among the other privateers were the *Georgia*, seized near the coast of Portugal, and the *Shenandoah*, which kept up her career of destruction until she learned that peace had been declared months before.

Sinking of the *Alabama*.

Other Confederate privateers.

During these tempestuous days, West Virginia, where the sentiment was strongly loyal, was cut off from Virginia proper and admitted into the Union, June 19, 1863. Nevada, whose Spanish name means "snow-covered mountain," became a State, October 31, 1864. It was part of the territory acquired by treaty from Mexico, and the third State carved from that cession.

New States.

EVENTS OF 1865.

Grant never loosened his grip, but remorselessly pressed Lee to the wall. The Confederate leader made an heroic fight, but his soldiers were in rags, starving, and worn out by incessant fighting. Hope died, and on the 9th of April, at Appomattox Court House, Virginia, he met General Grant, and surrendered all that was left of the once invincible army of Northern Virginia. The Union soldiers treated their former enemies like brothers, dividing their rations with them, and for the first time in weeks the gaunt, famishing Boys in Gray learned what it was to eat a full meal of wholesome food. Grant gave generous terms to Lee, not even asking for his sword. On April 26 General Johnston surrendered to General Sherman on the same terms that Lee had received. Before the close of May all the scattered forces of the Confederacy had submitted, and the war for the Union was over. President Jefferson Davis and the leading officials had fled from Richmond when warned by Lee that he could hold the city no longer. They were captured in Georgia, May 10, and Davis was committed to Fort

Close of the war.

Monroe on the charge of treason. He was released on May 13, 1867, and the prosecution was dropped in February, 1869.

Darkest days of the war.

The darkest days of the struggle for the Union came in 1864. This may sound strange, following as the period did, the opening of the Mississippi and the great victory at Gettysburg; but the awful loss of life and the terrifying expense, amounting to three million dollars a day, made many people ask whether the country was not paying more for the Union than it was worth. But the government could not abandon its efforts, no matter how colossal the difficulties in its path. When volunteers no longer came forward, enormous bounties were paid, and drafts enforced. This caused outbreaks and bloodshed in different cities, but drafting secured comparatively few recruits. Those who were able to do so, when drafted, paid large sums for substitutes, many of whom deserted, and enlisted several times under false names, finally escaping without service at all. If the end of the war had not been in sight when the year closed the efforts of the national government must have stopped.

Presidential election of 1864.

Those who saw little or no hope in the outlook nominated General McClellan for the presidency. A great deal of sympathy was felt for him because of what was believed to have been his unjust treatment by the administration. The platform upon which he was nominated demanded that fighting should cease and negotiations be opened with the Confederates. McClellan, however, was too patriotic to assent to any such surrender, and declared that the fighting should not stop until all armed rebellion was overcome and the Union fully restored. No vote of the eleven belligerent States figured in the election and, of the electoral votes, 212 were cast for Abraham Lincoln and Andrew Johnson, and 21 for George B. McClellan and George H. Pendleton. This decisive declaration that the war must be pressed to a triumphant conclusion crushed out everything in the nature of active opposition in the North.

Assassination of President Lincoln.

On the night of April 14, 1865, President Lincoln, worn out with his burdensome labors, but cheered and grateful over the final triumph of the Union, visited Ford's Theatre in Washington. He was sitting with his wife and several friends in a box, when an actor, inspired by an insane desire to do a deed that should "ring round the world," stole into the box behind the President, and shot him in the head with a pistol. He fell forward senseless, and died the next morning. The actor leaped from the box to the stage, shouted, "*Sic semper tyrannis!*" (thus always with tyrants), dashed out at the rear, sprang upon a waiting horse, and galloped off at full speed. He was pursued and brought to bay in a barn in Virginia, and while resisting arrest, was shot down. Several who were implicated with him in the conspiracy were tried and hanged, or sentenced to life imprisonment. On the night the President was assassinated an attempt was made upon the life of Secretary Seward. He was struck several times with a dagger as he lay in bed suffering from an injury received by being thrown from a carriage, and two of his sons and a nurse were wounded during the struggle. The assassin was one of the criminals who was hanged. A suspicion that the Confederate leaders were involved in the conspiracy proved to be without a shadow of foundation. They knew that in the death of Abraham Lincoln the South lost its best friend, for none but him could have soothed the resentment of the victors, nor so lightened the gloom of the vanquished.

VII. Expansion and Prosperity.

The seventeenth President.

As provided by the Constitution, Andrew Johnson, the Vice-President, was sworn in as the successor of the dead President. He was born in North Carolina, December 29, 1808. His parents were in the depths of poverty, and, when he became a large boy, he did not know the letters of the alphabet. He learned the tailor's trade, and removing to Tennessee, was married before he was out of his teens. His wife was a noble woman who aided and cheered him in his studies and political ambition. He acquired penmanship so late in life that it was always a labor for him to use his pen. No man lacking ability could have attained the success which early came to him. He filled several local offices while a young man, served in the State legislature and was Congressman in 1843–1853, then governor until 1857, when he became United States senator. Throughout all these years he was a radical Democrat, but an unflinching unionist. President Lincoln appointed him military governor of Tennessee when the State was torn by warring factions, and his life was repeatedly in danger. The bravery and resolution he displayed caused him to be placed on the Republican national ticket. He died July 31, 1875.

The great war for the Union had closed in triumph, but more than one problem remained to be solved. President Johnson was ill-fitted by his passionate temper and stormy experience to guide affairs during the troublous times that followed the civil strife. There was fear that he would add to the inflamed feelings by his violent course toward the Confederate leaders. For awhile his conduct gave ground for this misgiving, but ere long he went to the other extreme and quarreled with the political party that had elected him to office.

Civil government was topsy-turvy in the South, and the President set out to restore the States to their former places in the Union in accordance with a plan of his own. The temporary governors which he set over them called conventions of the citizens who declared their ordinances of secession null and void; repudiated all debts caused by the war; abolished slavery within their respective limits, and ratified the Thirteenth Amendment to the Constitution, which ended African slavery forever in the United States. The last step was necessary because, when, as has been stated, President Lincoln set free the slaves in certain States, he had no power to do more. Some slave States, like Maryland, Kentucky, and Missouri, had never seceded. To extinguish the institution, therefore, an amendment to the Constitution was necessary. This amendment was formally proclaimed December 18, 1865.

The Thirteenth Amendment.

But the scourge of nearly two and a half centuries could not be wholly swept away by this legislation. Four million negroes had been set free, but they were still in the South, and the important question remained as to what should be done with them. The southern legislators did not believe they would work, and passed such stringent laws regarding vagrants and paupers that the blacks were in hardly any better situation than when in legal slavery.

The negro problem.

The policy of the President roused the anger of the Republicans, and when Congress assembled in December, 1865, it immediately set out to undo all that had been done, and to substitute its own policy therefor. The senators and representatives from the late seceding States were refused admission. The Republicans in Congress were numerous enough to override the vetoes of the President. In the face of his indignant opposition, a bill was passed giving citizenship to all negroes, and placing them under the protection of the United States courts and the military and naval forces, against any State interference with their rights. This Civil Rights Act provided that the congressional representation of every State denying the franchise should be reduced; that prominent ex-Confederates should be excluded from Federal offices until pardoned by Congress, and prohibited the payment of any debt incurred by the rebellion against the United States.

The Civil Rights Act.

The occurrences of 1866 added to the opposition against the President's policy. There was serious

rioting in New Orleans and violent quarrels between the supporters and opponents of the Civil Rights Act in the South. Tennessee made haste to adopt the Fourteenth Amendment, and her representatives were promptly admitted to Congress. All the other late Confederate States rejected the Amendment. The new Congress was more radical than its predecessor, and the quarrel between that body and the President was intensified. Congress was determined. It passed the Tenure of Office Act, which deprived the President of his hitherto unquestioned right to make removals from office, and the lieutenant-general was made virtually independent of him. The final law was the "Military Reconstruction Act," which blotted out all the governments established by the President, and divided the South, with the exception of Tennessee, into military districts, each commanded by a general of the army, who directed a new reorganization of the State governments. The blacks and whites were placed on equal terms regarding enfranchisement, except that a great many whites were disfranchised for their part in the rebellion. When any of these States conformed to this Act and ratified the Fourteenth Amendment, it was entitled to full representation in Congress.

The Military Reconstruction Act.

The States finding they had no choice but to submit, reluctantly ratified the Fourteenth Amendment which was proclaimed July 28, 1868. California did not act upon the Amendment, but Alabama, Arkansas, Florida, Louisiana, North and South Carolina sent delegations to Congress who were admitted in June, 1868. Tennessee, as we know, had been admitted in 1866, but Georgia, Virginia, Texas, and Mississippi refused to give their former slaves equal rights with their late owners. They yielded, however, in 1870, when for the first time in nine years, every State in the Union was admitted to full representation in Congress.

All the States admitted to representation.

Congress had good reason to fear that the President, in accordance with what had hitherto been regarded as his constitutional right, would remove those officials who differed with him in politics. This was the cause of the passage of the Tenure of Office Act (March 2, 1867), which forbade such removals without the consent of the Senate. The President defied Congress and disregarded the Act. For this he was impeached, that is charged by the House of Representatives with the commission of high crimes and misdemeanors. In accordance with the provisions of the Constitution, he was placed on trial by the Senate, Chief Justice Chase presiding. The proceedings were watched with grave interest throughout the country, for nothing of the kind had ever occurred in our history. The trial began March 5, and closed May 16, 1868. Thirty-five Senators declared the President guilty. One more vote would have convicted him. After the lapse of so many years, when we can calmly consider all the circumstances, we must admit that this acquittal was a fortunate issue of the regrettable proceedings.

Impeachment of President Johnson.

Incidents of a different character, during those stormy times, require notice. The costly and laborious efforts to lay an Atlantic cable finally attained success, and on August 4, 1866, the line connecting Newfoundland and the coast of Ireland was opened for use.

Successful Atlantic cable.

The Fenians are an Irish organization whose object is the freeing of their native land from British rule. On the first day of summer in 1866, 1,500 Fenians entered Canada, but were driven back by the Canadian troops. This armed invasion was a glaring violation of law, and half the men were captured by a United States gunboat. Later, another Fenian force crossed the border from St. Albans, Vermont, but were rounded up by General Meade and sent home. It is worth remembering that since early colonial times, no invasion of Canada from our side has ever been successful.

Fenian troubles.

Although in the late war between Russia and Japan, our sympathies have been mainly with the latter country, we cannot forget the valuable friendship shown to us by Russia, when we were in sore need of such friendship. Partially perhaps in recognition of this aid, the United States in October, 1867, purchased Russian America (since known as Alaska), for the sum of $7,200,000. Everybody believed at the time that Russia had much the better of the bargain, for the land was looked upon as producing little else than chilling fogs and icebergs. The development of the fisheries and the fur industry has since made Alaska one of our most valuable possessions.

Purchase of Alaska.

The sinister enmity of Emperor Napoleon to the American Union displayed itself in 1862, when he landed a French army in Mexico for the conquest of the country. He saw we had too much on our hands just then to make objections. His first announcement was that his army had entered Mexico in conjunction with a Spanish and British force to compel the payment of certain debts. When his real purpose became clear, the English and Spanish troops were withdrawn, and the imperial adventurer was left to carry out his designs alone. He succeeded in overthrowing the Mexican republic and proclaimed the Archduke Maximilian of Austria, emperor.

The French expelled from Mexico.

Thus matters stood when General Lee surrendered at Appomattox, and our government had time to give attention to this interloper on the American continent. Behind the curt hint sent to him, loomed the majestic form of the *Monroe Doctrine*, and Napoleon took fright at once. Abandoned by the one who had duped him, Maximilian strove hard to retain a footing, but he was pressed to the wall, captured and shot (June 19, 1867) by the Mexicans, who re-established the republic, whose prosperity has not since been interrupted.

General Grant, as the foremost Union hero of the Civil War, was nominated for the Presidency by the Republicans, with Schuyler Colfax of Indiana for the second place on the ticket. The Democrats nominated Horatio Seymour of New York and Francis P. Blair of Missouri. The Republicans were successful by 214 electoral votes to 80.

Presidential election of 1868.

Ulysses S. Grant was born at Point Pleasant, Ohio, April 27, 1822, and was graduated from West Point in 1843, with only a moderate standing. He did creditable service in the war with Mexico, and attained the rank of captain, but attracted no special attention by his services. He resigned in 1854 and engaged in business, without much improvement in his fortunes. He was one of the first to volunteer at the outbreak of the Civil War. His great military ability steadily carried him to the front among the Union generals, and it was his glorious privilege to bring the great struggle to a successful conclusion. After his retirement from the presidency, he was unfortunate in business speculations, being shamefully defrauded by those in whom he placed trust. He regained considerable of his fortune through the publication of his *Memoirs*, which had an enormous sale. After suffering long and intensely from a cancer which developed at the root of his tongue, he died July 23, 1885.

The eighteenth President.

The reconstruction period, beginning shortly after the close of the war, and lasting, with greater or less virulence, for some ten years, was in many respects the most disgraceful era in American history. The magnificent resources of the South drew a great many northerners thither, who invested capital and strove by every legitimate means to build up the waste places. They were welcomed by the former "Boys in Gray." Soldiers who have tested each other's mettle on the battle field make the truest of friends, and the reunion on the part of the officers and privates of both sides was complete. Northern wealth has aided greatly in the development of the South, and many

The reconstruction scourge.

southerners themselves through their natural ability have acquired comfort and competence.

But over the heads of these good men flew the vultures drawn southward by the scent of plunder. When they alighted, they found other vultures waiting to help in the spoliation of the helpless land. Those who came from the North were called "carpet baggers," because about all they owned in the world was contained in such receptacles. The southerners who joined them in robbery were known as "scalawags." They set on foot an era of thievery, corruption and debauchery, that few persons, who had not been on the ground and seen for themselves could believe. In several instances, these miscreants turned up in Washington as United States senators and representatives, but the great majority devoted their energies to robbery. In some States, the negroes outnumbered the whites. They were ignorant to the last degree, many of them vicious, and nearly all the tools of the more vicious carpet baggers and scalawags. To such were committed the framing of laws, the dispensing of enormous sums of money, and the government of those who represented all the real culture and intellect of the State. It has been said that if a conflagration had been started in Virginia, which laid in ashes every home to the Gulf, it would have been no worse than the nightmare of misery and crime. The North never would have consented to this hideous wrong, had it known its frightful character and extent. The South in retaliation organized secret associations, which intimidated the negroes. The most powerful of these was the Ku-Klux Klan, which introduced a reign of terror in many sections, and was not wholly extirpated for a number of years.

Rule of the "carpet baggers" and "scalawags."

A railway across the continent was begun in 1863, but little was accomplished until after the close of the war. The line, starting from Omaha, Nebraska, was pushed steadily westward, while the other division, beginning at San Francisco, was hurried eastward. On the 10th of May, 1869, the two tracks were joined at Ogden, Utah. The engines, as they approached each other, saluted with their whistles, the crowd cheered, and the last rail was fastened in place with a spike of gold. The completion of this great enterprise gave an impetus to western emigration, that had been much encouraged by the Homestead Act, passed in 1862, which gave farms of eighty or twice that number of acres to settlers who cultivated them for five years.

Completion of the Pacific railway.

One of the most destructive conflagrations in history broke out in Chicago, on the night of Sunday, October 8, 1871, due, it is claimed, to the upsetting of a lamp in a stable, where an Irish woman was milking her cow. The flames were fanned by a strong wind and soon acquired resistless power. When they burned themselves out, on Tuesday, nearly four square miles of the business and resident portion of the city were in ashes. Twenty thousand buildings were destroyed, 250 lives lost, 100,000 people made homeless and $200,000 worth of property consumed. Every part of the Union, even the impoverished South, nobly responded to the cry for help, and the new city, built on the ruins of the old, was grander in every respect. Boston received a similar visitation in November of the following year. The fire, which raged for twenty-four hours, destroyed 800 buildings and $75,000,000 worth of property in the commercial heart of the city.

Great fires in Chicago and Boston.

The Fifteenth Constitutional Amendment, which gave the franchise to negroes, on the same conditions as to white men, was not acted upon by Tennessee, and was rejected by California, Delaware, Kentucky, Maryland, New Jersey, and Oregon, but ratified by the remaining thirty States. New York rescinded its ratification, January 5, 1870, and the ratification of the Amendment was proclaimed March 30 following.

The Fifteenth Constitutional Amendment.

The test of this last Amendment to the Constitution demonstrated that it was a grievous mistake. The liberated slaves should not have been given the ballot until prepared for the high privilege by some preliminary training. Few understood the true nature of the important trust and most of them became the tools of the conscienceless men who inflicted carpet-bag rule upon the South. The enmity between the two races was inflamed, so that to-day many of the most intelligent people look with despair upon the problem of the right adjustment of the relations between the white and the black men of the South.

Great Britain had violated international law through the aid which she gave in fitting out Confederate privateers during the Civil War. Our government pressed its claims for damages inflicted upon our commerce by these violations of law. The matter was urged with diplomatic skill, and finally a joint high commission, composed of five English and five American members, met in Washington, in February, 1871, to consider the subject. After deliberating for nearly three months, they agreed to submit the question to a board of arbitration, which assembled at Geneva, Switzerland, in June, 1872. The decision of this board was that England should pay the United States the sum of $15,500,000, for damages inflicted by the Confederate cruisers. At first, England was indignant over the verdict, but she paid the money. It will be recalled that it was about this time that the Emperor of Germany, acting as arbitrator, decided that the island of San Juan, on our northwestern boundary, and over which there had been a prolonged dispute, belonged to the United States.

The Geneva award.

The presidential election of 1872 was a remarkable one. President Grant was renominated by the Republicans, with Henry Wilson of Massachusetts in the place of Schuyler Colfax. There was considerable dissatisfaction in the party, some thinking the administration had been too harsh in dealing with the southern problems. These persons called themselves "Liberal Republicans" and nominated Horace Greeley, the veteran editor of the New York *Tribune*, as their candidate, with B. Gratz Brown of Missouri as the nominee for the vice-presidency. The nominations were afterward formally ratified by the Democrats, who thus accepted as their candidate, the man that for years had been their most vigorous opponent. Thousands of dissatisfied Democrats refused to vote for him.

Presidential election of 1872.

The nominees for the presidency, in 1872, were: Ulysses S. Grant, Republican; Horace Greeley, Democrat and Liberal; Charles O'Connor, Democrat; James Black, Temperance; Thomas A. Hendricks, Democrat; B. Gratz Brown, Democrat; Charles J. Jenkins, Democrat; David Davis, Independent.

The nominees for the vice-presidency were: Henry Wilson, Republican; B. Gratz Brown, Democrat and Liberal; John Q. Adams, Democrat; John Russell, Temperance; George W. Julian, Liberal; A. H. Colquitt, Democrat; John M. Palmer, Democrat; T. E. Bramlette, Democrat; W. S. Groesbeck, Democrat; Willis B. Machen, Democrat; N. P. Banks, Liberal.

Horace Greeley was so crushed by his overwhelming defeat, that he lost his reason and died soon after election. The electoral vote was: Grant and Wilson, 286; Hendricks and Julian, 42; Brown and Colquitt, 18; Jenkins and Palmer, 2; Davis and Bramlette, 1. The Greeley electors scattered his votes among the other candidates.

General Grant had been educated at West Point, where deception and dishonesty are capital crimes. His intimate associates in the army were men similarly trained. Among none is personal honor and probity held so high. It was hard for President Grant to believe that any friend whom he trusted could betray that trust, and, until the unmistakable proof was presented, he refused to believe such betrayal. Even then the grievous truth was slow in impressing him. It was this trait in his character which made him the victim in more than one instance of unscrupulous men, and brought him financial disaster after his

President Grant's high sense of honor.

retirement from the presidency. No stronger friendship is possible than exists among soldiers, and nowhere is mutual loyalty more enduring. He and his officers were brothers, each proud of the patriotism and military ability of the others, and all eager to do their utmost for the honor and glory of his country. A retired surgeon-general of the army remarked to the writer: "When I was in the Department of the East, the great question discussed among the officers was whether the war would succeed or fail; while all were hopeful, doubt was ever present. Upon my transfer to the West, I entered a new atmosphere; no one felt any misgiving as to the final issue; they knew success was as certain to come as the sun was to rise on the morrow. Not a particle of jealousy showed itself; all felt that a master was at the helm, and every one was ready to give his life to uphold him. General Grant, on his part, never doubted this devotion; he was quick to commend, and considerate in his reproofs. No officer under him ever held a higher opinion of his own capacity than Grant held of that officer's ability. He trusted him to the limit. The same trait dominated him when brought into contact with civilians and politicians. The consequences were regrettable at times, and were to be expected in the nature of things, but do we not admire and love the great Captain all the more because his failings leaned to virtue's side?"

For reasons intimated above, the second administration of President Grant was stained by a number of scandals. The Credit Mobilier was an organization whose purpose was to gain accessive profits out of the building of the Union Pacific railway. An exposure in 1872–3 showed that an enormous corruption fund had been expended in Congress and to secure political influence in favor of the enterprise. The whole country was shocked by the swindles and frauds that were brought to light. They penetrated the War Department, the Custom House, and the Indian Bureau. No more abominable rascalities are conceivable than those committed by the "Indian ring" in Washington. The most solemn pledges to the different tribes were violated; they were turned out of their reservations, where they had established comfortable homes, and sent to barren deserts, against the protests of army officers, and there left to starve. In their desperation, some of these Indians took the war path and committed many atrocities. It was another illustration of our universal method of dealing with the aborigines, and of the law that the innocent must suffer for the guilty, who prosper upon their plunder. The "whiskey ring" was another swindling organization, who cheated the government out of hundreds of thousands of dollars. As if to keep pace with the national shame, the uprooting of the "Tweed ring" in the city of New York, about this time, revealed that the metropolis had been robbed of millions of dollars by a set of shameless rogues.

Scandals.

No one understood the Indian question better than General Grant, for his life in the army previous to the Civil War had brought him in intimate contact with the red men, and he knew the wrongs they had suffered from the time of the founding of Jamestown. He was anxious to do them justice, and allowed the Quakers, or followers of William Penn, to try the Golden Rule in dealings with the Indians. The gentle Friends were successful as a matter of course; but all their good intentions were brought to naught by the execrable ring, to which reference has been made. The good men were compelled to give up in despair, and matters became as bad as before.

The Indian problem.

After some experimentation, the government adopted the policy of setting aside extensive tracts of land, for exclusive occupancy by Indians, who were not to leave the limits, without permission of the authorities. There are several score of such reservations, many of which are larger than some of the States. Indian Territory is the principal of these reservations, having been formed in 1834. Each of the five civilized tribes (Seminoles, Choctaws, Creeks, Cherokees, and Chickasaws) is an independent "nation," with a government modelled after our own. They have schools, colleges, newspapers, banks, and in every respect are as fully civilized as many communities in the United States. But it has taken more than half a century to bring about this condition of affairs. Their wilder brethren did not like the idea of being "shut in," even though the limits covered hundreds of thousands of acres of mountain, river, and prairie. They felt that the boundless continent was theirs.

Indian reservations.

Indian Territory.

But some tribes were incited to revolt because their reservations were arid and almost uninhabitable, in contrast to the pleasant homes from which they were driven. This was the case with the Modocs, a tribe numbering only a few hundred people, living upon fertile lands in Oregon and northern California. When they reached the tract set aside for them, they were so incensed that they went back to their former homes, from which they declared that the United States government should not remove them. They took refuge among the lava beds in northern California, where, after a long time, they were surrounded by United States troops. Several members of the Peace Commission met the Modocs under a flag of truce (April, 1873), in the hope of persuading the malcontents to go to their reservations. While the conference was under way, the Indians, who had concealed knives under their blankets, attacked the white men. General E. R. S. Canby and another officer were killed, while a third, though badly wounded, managed to escape by flight. Operations against the Modocs were pressed, and they were finally hemmed in and compelled to surrender. The three most guilty were hanged, and it was thought best to remove the others to a reservation in Dakota. They were thoroughly cowed, and since the new home was superior to the one that caused the trouble, they accepted the situation.

The Modoc War.

Shortly after the incidents described the discovery was made that gold existed among the Black Hills in Dakota. Inevitably, the news sent thousands of gold seekers to the region, with no thought or care of the rights of the Sioux Indians, to whom the section belonged. These red men are among the most warlike on the continent. They were quick to seize the pretext for leaving their reservation and to make savage raids upon the settlements of Montana and Wyoming. A strong military force compelled the hostiles to retreat toward the Big Horn River and Mountains. They were followed by Generals Custer and Reno with the famous Seventh Cavalry, who came upon the extensive Sioux encampment on the Little Big Horn River. Custer sent for reinforcements, and, without waiting for them, rashly charged the encampment which was over two miles in length. The warriors outnumbered the soldiers more than ten to one, and literally overwhelmed them. Custer and his troops fought with desperation, but were annihilated. In this massacre of June 25, 1876, the loss of the Seventh Cavalry was 261 killed and 52 wounded. General Reno, who had attacked at the other end of the encampment, was saved by the arrival of reinforcements. After further fighting, and negotiations, the Sioux were induced to return to their reservation.

The Sioux troubles.

Custer's massacre.

The year 1873 saw a repetition of the panic of 1837, the cause in both instances being much the same. Westward emigration and growth were on an immense scale, railway construction was in advance of the demand, and speculation was rampant. It is at such times of high prices and financial depression that the clamor is made for "cheap money," and the issue of more currency. It was this delusive idea that prompted Shays's insurrection in Massachusetts in 1787, and has caused disturbances since then. Many think that since the government is plentifully supplied with printing presses it ought to print all the money needed. If such were the fact it would never be obliged to im-

The panic of 1873.

pose taxes. But simple legislation cannot give value to paper money. The Continental currency of the Revolution and the Confederate issues became worthless because the respective governments could not redeem their promises. Gold became the established standard. There was a time during the Civil War when a United States dollar bill, or "greenback," was worth only thirty-five cents in gold, because at that time it did not seem absolutely certain that the national government, with its practically limitless resources, would be able to meet its enormous obligations. The necessities of war compelled Congress to issue millions of greenbacks. The country did not contain enough gold and silver to redeem them, but many insisted that the volume of currency should not be reduced, but the legal-tender irredeemable paper money should be continued. These people formed the "Greenback party," or "Greenbackers," who were a factor in politics for several years.

The Greenback party.

In 1875 Congress passed the Resumption Act, declaring that on and after January 1, 1879, all greenbacks, government bonds, and national bank notes would be redeemable in coin. Let us follow this important matter to its conclusion. A number of European nations had ordered that debts should be paid in gold alone. This cheapened silver, and many foreigners made large profits by buying American gold, for gold and silver had the same value in the United States. To stop this ruinous drain, Congress in 1873 ceased coining silver dollars, and made silver a legal tender only for debts of less than five dollars. This has been termed the "demonetization of silver," and is still occasionally referred to as the "crime of 1873."

Financial problems.

The "crime of 1873."

In 1878, silver was "remonetized," by the Bland-Allison bill, which was passed over the President's veto. It renewed the coining of the silver dollar, at the ratio of 16 to 1. This expression, which is often heard, means that sixteen pounds of coined silver are equal in value to one pound of coined gold. Silver became a legal tender for all private and public debts. Silver bullion was coined without charge to any person bringing it to a mint. This, as in former years, constituted the "free coinage of silver." The Secretary of the Treasury was ordered to buy monthly not less than $2,000,000, nor more than $4,000,000, of silver. Because of its bulk, these large sums were deposited, when required, in the Treasury, certificates being given to the owners. The value of paper money gradually rose, and on January 1, 1879, touched par. Specie payments were resumed without jar or friction.

Remonetization of silver.

Specie payments resumed.

Beginning in 1875, a series of centennial anniversaries were held throughout the country, concluding with that of the surrender at Yorktown in 1781. The most impressive was the celebration of the signing of the Declaration of Independence, in Philadelphia. The exhibition was opened on May 10, 1876, and lasted for six months. President Grant made the address in the presence of many foreign dignitaries, prominent Americans, and an immense multitude. Some forty nations were represented by their rarest treasures of art, and interested spectators crowded to Fairmount Park from all the civilized world. The principal buildings were the Main, Art Gallery or Memorial Hall, Machinery Hall, Agricultural Hall, and Horticultural Hall. The total attendance was nearly ten million persons.

The Centennial exhibition.

Colorado was admitted into the Union, August 1, 1876, because of which it is sometimes called the "Centennial State." It belonged to the Louisiana purchase and the Mexican cession of 1848. It is a very mountainous country and contains more than a score of peaks three miles in height. Explorers visited the region in 1858, and found considerable gold, and later immense deposits of silver were brought to light. The production of this metal is double that of any other State. Colorado was organized as a Territory in 1861, and in 1865–67, was kept out as a State by a veto of President Johnson. It was denied again by Congress in 1873, finally to succeed, as has been shown, three years later.

Admission of Colorado.

It may be doubted whether our country ever passed through graver peril than in 1876–77. Not all understood the gravity of the crisis, the like of which it is to be prayed may never be seen again. The presidential and vice-presidential nominations were: Democrats, Samuel J. Tilden of New York, and T. A. Hendricks of Indiana; Republicans, Rutherford B. Hayes of Ohio, and William A. Wheeler of New York; Greenbackers, Peter Cooper of New York, and Samuel F. Cary of Ohio; Prohibitionists, Green Clay Smith of Kentucky, and Gideon T. Stewart of Ohio; Americans, James B. Walker of Illinois, and D. Kirkpatrick of New York. No electoral votes were cast for any of the candidates except the Democrats and Republicans, so that further reference to the unsuccessful ones is unnecessary.

Presidential election of 1876.

It was evident that the election would be close, and the returns seemed to leave no doubt of the success of the Democrats. The latter celebrated the victory which had come to them after long waiting, and the Republicans, with a few exceptions, yielded the contest. But, unfortunately, the condition of affairs in the South gave room for fraud. The carpet-bag governments were still in power in South Carolina, Florida, and Louisiana. Could the electoral votes of all these States be secured for Hayes, he would have 185 to 184 for Tilden. The States named sent in double returns and Oregon also forwarded two sets of returns, one of which recorded its three votes for Hayes, and the other gave two to him and one for Tilden. It was necessary that all these, in addition to the States mentioned, should be counted for Hayes, or the election would pass to his Democratic opponent.

Congress had to decide which set of returns to accept, but the two branches would never agree, because the House was Democratic and the Senate Republican. The Democrats believed the Republicans were plotting to obtain the one vote necessary, and the resentment deepened every hour. Thoughtful men saw the danger of a revolt that would threaten the existence of the country. So alarmed became the leaders of both parties, that Congress was persuaded to agree to refer the questions in dispute to an Electoral Commission to be composed of fifteen members. These were five senators, five representatives, and five judges of the Supreme Court. Of this number seven were Democrats and seven Republicans. It was expected that the fifteenth, whose vote would decide the tie, would be Judge David Davis of Illinois. Party obligations had rested lightly on him for years and no one doubted that his decision would be unbiased and impartial. But he resigned and was succeeded by a prominent Republican judge. The Electoral Commission therefore stood 8 Republicans to 7 Democrats, and this was the division upon every one of the disputed points. Thus Hayes secured the indispensable votes, the announcement being held back until two days before his inauguration. For the first time in our history, the title to the presidency was tainted with fraud.

The Electoral Commission.

Rutherford Birchard Hayes was born at Delaware, Ohio October 4, 1822. After graduating from college, he became a lawyer, but volunteered on the outbreak of the Civil War. He was an excellent soldier and rose to the rank of brevet major-general. Entering politics, he was fortunate from the first. He represented his State in Congress, and was governor from 1868 to 1872, being re-elected in 1875. His last election was won on the "hard money" platform, and was so decisive that it drew the attention of the country to him, and brought about his nomination for the presidency the following year. When his term closed, he

The nineteenth President.

made his home at Fremont, in his native State, where he died January 17, 1893.

The administration of President Hayes had many creditable features. He set earnestly to work to soothe, so far as he could, the passions roused by the Civil War. In many cases, the embers still burned, and plenty were trying to fan them into flame. He withdrew, so far as was prudent, the national garrisons from the South, and in South Carolina and Louisiana, he recalled his recognition of the governments which had elected him, and which were now displaced by the respective courts and legislatures. One of the members of his cabinet (Postmaster-General David McK. Key) was an ex-Confederate officer.

Policy of the administration.

The commendable efforts of President Hayes in the direction of fraternal feeling were checked in a number of quarters by violent strikes on the principal railway lines of the country. The first was on the Baltimore and Ohio in the summer of 1877. The Brotherhood of Locomotive Engineers never strike until all other remedies for their grievances have failed, and they gave their sympathy to those who had stopped work. The revolt rapidly spread until traffic was blocked on six thousand miles of railway, and fully a hundred thousand employees were idle. In many instances, the militia when called out, proved useless because of their sympathy with the strikers. Finally an appeal was made to the United States government. There was rioting in different cities, marked by bloodshed. The most vicious was at Pittsburg, where pandemonium reigned for several days, and arson, pillage, and murder were unrestrained. Weeks passed before the disturbances ended and quiet was restored.

Great railway strike.

It was President Jackson who introduced the policy of "to the victors belong the spoils," and his successors carried out the practice with greater or less thoroughness. With every political change of administration, thousands were removed from office to make room for those who had aided in the election of the successful party. It inevitably followed that multitudes of officials, who had become skilled in their duties by years of training, were succeeded by incompetents. In some instances, the successor was of the same political party as the official displaced, but it was thought necessary to reward the former for his more valuable assistance. The public service suffered, and the evil became so crying that a demand was made for its correction. A perfunctionary concession was made in some of the platforms in the way of pledges of civil service reform, but they were meaningless, and party clamor prevented the fulfillment of these ante-election promises. President Grant, in 1870, induced Congress to take the first practical step toward reform by introducing the competitive system of examinations. It was disliked by Congressmen, who saw themselves deprived of the means of rewarding their most active political workers. After three years of sullen support, they refused to appropriate money for the purpose, and reform for the time was dead. Behind the politicians, however, was the indignant public, who would not keep silent, and who, as we shall see, were in the end triumphant. Some of the leading events of President Hayes's administration have already been named. One was the passage, in 1878, of the Bland Silver bill, over the veto of the President, and the other was the resumption of specie payments on January 1, 1879. With the exception of the railway strikes, Hayes's term was uneventful. While it is quite certain that no other nation in the world would have submitted without revolution to the decision of the Electoral Commission, yet having submitted, the American people seemed to lose all interest in it. Ten years had passed since the close of the Civil War; many portions of the South lay prostrate and desolate, only waiting for the vivifying touch of the capitalist and laborer. And this waiting was not in vain, for the work of regeneration, begun some time before, was pushed with a vigor that brought the best results. Prominent southerners said to the writer: "Settle your own political quarrels; they are of the slightest possible interest to us; our main question is the one of bread and butter; send us your capitalists and we shall welcome them, and thank you still more if you let our State governments alone. The negro is with us and we understand him better than you; we will do him justice, though the problem for the present seems insolvable." This feeling was common in the South and is not without its force to-day, for the question of the best policy for the negro has not been definitely settled.

Civil service reform.

Building up of the South.

The presidential and vice-presidential candidates in 1880 were: Republican, James A. Garfield of Ohio, and Chester A. Arthur of New York; Democrat, General Winfield S. Hancock of Pennsylvania, and William H. English of Indiana; Greenback, James B. Weaver of Iowa, and B. J. Chambers of Texas; Prohibition, Neal Dow of Maine, and H. A. Thompson of Ohio; American, John W. Phelps of Vermont, and S. C. Pomeroy of Kansas. Of the electoral votes cast, Garfield received 214 and Hancock 155.

Presidential election of 1880

James A. Garfield was born at Orange, Ohio, November 19, 1831. He began life in circumstances almost as humble as those of Abraham Lincoln. His labors in the backwoods, as a driver of a canal boat, and his fondness for athletic sports gave him sturdy health and strength and a powerful physique which stayed with him throughout life. He was a diligent student at school, and was graduated from Williams College in 1856. He became a member of the faculty of Hiram College, which he had previously attended for several terms. He served in the State Senate and volunteered at the outbreak of the war. He possessed military ability of a high order, and had he remained in the service, must have attained prominent rank. He took an active part in the battle of Chickamauga, and was made a major general. It was his wish to remain in the army, but the wise Lincoln saw that he could do more for his country in the political field, and persuaded him to enter it. He was a congressman for seventeen years, when he was elected to the United States Senate. His nomination to the presidency prevented his taking his seat in that body.

The twentieth President.

The duties of his office kept President Garfield in Washington through the early days of the oppressive summer of 1881, but having completed his arrangements to join his family at the seashore, he left the White House on the 2d of July, in company with Secretary Blaine and one or two friends. At the railway station, while conversing with Mr. Blaine, an execrable wretch stole up behind him and shot him with a pistol in the back. The suffering President was carried to the executive residence, while the assassin was hustled to prison in time to save him from lynching. The President died at Long Branch, whither he had been taken, on the 19th of September following.

Assassination of the President.

Chester A. Arthur, who succeeded to the presidency, was a native of Franklin county, Vermont, where he was born, October 5, 1830. After his graduation from Union College, in 1849, he taught school, and became a successful lawyer in New York city. He was quartermaster-general of his State during the Civil War, and rendered efficient service in equipping and forwarding troops to the front. He became collector of the port, holding the office until July, 1878. President Arthur was noted for his courtesy and polished address, and, though he does not rank among the great Presidents, he filled his high office creditably, and faithfully carried out the policy of his party. He died November 18, 1886.

The twenty-first President.

A *sidereal day* is the time occupied by the earth in making an absolute revolution on its axis; an *apparent day* is the interval between two consecutive transits of the sun over any meridian, and its length varies from day to day; a *mean solar day* is the average of all the apparent solar days in the year; the *astronomical day* begins at noon and the *civil day* at the preceding mid-

Divisions of time.

right; a *sidereal year* is the interval during which the earth makes one absolute revolution around the sun: this interval is invariable and consists of 365 days, 6 hours, 9 minutes, and 9.6 seconds.

The first reformation of the calendar was made by Julius Cæsar, in B. C. 45, when he ordered that every year whose date number is exactly divisible by four should contain 366 days, and all other years 365 days. He introduced the intercalary year by counting the sixth day before the Kalends of March twice; hence the name bissextile (*bis*, twice and *sex*, six). Cæsar also changed the beginning of the year from the 1st of March to the 1st of January, and the name of the fifth month — Quintilis — to July after himself. It will be seen therefore that the average length of the Julian year is precisely 365¼ days, which is too long by 11 minutes and 14 seconds. This caused no inconvenience to the great Roman, but in the course of four centuries, a surplus of three days accumulated, and in A. D. 1582, this amounted to ten days. In that year, Pope Gregory XIII. introduced the calendar named for him. This makes the year 365 days, with 366 days to every year exactly divisible by four, and to every centurial year exactly divisible by 400. Thus 1900, as we recall, was not a leap year, nor was A. D. 1800, nor 1700, but A. D. 2000 will be a leap year. It has been pointed out that if it had been agreed that the centurial years exactly divisible by 4,000 should contain 366 days, there would be an error of only one day in 20,000 years, which certainly is near enough to the truth for all practical purposes. The exact length of the mean Gregorian year is 365 days, 5 hours, 49 minutes, and 12 seconds.

The Gregorian Calendar was introduced into England and her colonies in 1752, at which time the Equinox had retrograded 11 days since the Council of Nice in A. D. 325. Hence there was an advance of that number of days, the former being referred to as Old Style, and the latter as New Style. Thus we say George Washington was born February 11, O. S., or February 22, N. S. When England adopted the Gregorian Calendar, she changed the beginning of the legal year from March 25 to January 1. The year 1751, therefore, had no January or February, and only 7 days of March. The difference between the Julian and the Gregorian Calendars now amounts to 13 days. Russia is the only modern nation that clings to the Julian Calendar.

Despite the remarkable ingenuity shown in arranging the divisions of time, the traveling public was still subjected to an annoyance, for when a man was journeying either eastward or westward his watch continually lost or gained time. A few miles were sufficient to show a difference, which became more marked as he progressed. This state of affairs was especially troublesome to the railway lines, which crossed a portion or all of the continent. In 1883, by mutual consent, a standard was established for the running of trains and the regulation of local time. The United States stretches from 65 to 125 degrees west longitude. These 60 degrees were divided into four time-sections of 15 degrees each, equivalent to one hour, and beginning with the 75th meridian. In the first section to the east lies all territory between the Atlantic coast and an irregular line extending from Detroit to Charleston, S. C. This constitutes eastern time. Central time prevails in all territory between eastern time and an irregular line from Bismarck, North Dakota, to the mouth of the Rio Grande. Mountain time includes all the territory between the last-named line and nearly the western borders of Idaho, Utah, and Arizona. Pacific time embraces all the remaining country to the Pacific coast. Thus when it is noon in Philadelphia or New York city, it is 11 o'clock in Chicago or St. Louis, 10 o'clock in Denver or Santa Fé, and 9 o'clock in Los Angeles or San Francisco.

Standard time.

The Pendleton Act, passed in 1883, was the first definite step in making merit a basis for appointment in the National Civil Service. President Arthur honestly carried out its provisions, as did most of his successors. The system worked so well that it has been adopted by a number of States. The law has been supplemented and improved, and has become so important an agency in the betterment of the public service that its principal features may be summarized.

Civil service reform.

The act provides for the appointment of three commissioners, a chief examiner, a secretary, and other employees, the duty of the commissioners being to aid the President when requested in preparing suitable rules and regulations and to investigate and report as may be necessary. All that part of the Executive Civil Service is arranged in the following branches: the Departmental Service, the Customs Service, the Postal Service, the Government Printing Service, and the Internal Revenue Service. Minute directions are furnished to those desiring to make application for examination. All must attain a rating of 70 per centum of complete proficiency, except applicants who have claims for military or naval preference, who need obtain but 65 per centum. Competitive examinations are also necessary for promotion, and no consideration is given to religious or political opinions on the part of the applicant. Political assessments are forbidden, though it is hardly necessary to add that most of the office holders are made to feel the necessity of contributing financial help to the party with which they are affiliated.

We remember the general belief that in our purchase of Alaska, Russia had much the better of the bargain, though it has developed since then that the country is worth ten times the sum paid for it. Lieutenant Frederick Schwatka, U. S. A., without any authority from our government, left Portland, Oregon, with the *Victoria*, on May 23, 1883, for the purpose of exploring the interesting region. After reaching Victoria in British Columbia, Schwatka crossed to Port Townsend and followed the inland passage. He brought back valuable information of the country and its inhabitants, one discovery being that the Yukon River is the third in length in the United States, and the fourth in North America.

Alaskan exploration.

The centennial anniversaries of the leading events of the Revolution closed with the evacuation of New York by the British, November 26, 1783. More important than this was the anniversary of the surrender of Lord Cornwallis, at Yorktown, Virginia, October 19, 1781. That victory closed the long struggle and secured our independence. The celebration drew thousands of visitors to Yorktown, among them many of our most distinguished citizens. The opening prayer was by a grandson of Governor Nelson, commander of the Virginia militia a hundred years before, and the grandson of Patrick Henry was among the visitors. One of the historical exhibits was the sword voted to the messenger, who, riding at headlong speed, carried the momentous tidings to Philadelphia, the national capital. At the closing exercises on the 19th, there were too many State governors and dignitaries to be enumerated, while among the German and French guests were numerous descendants of those who had aided us in our struggle for freedom. A responsive thrill was awakened on both sides of the Atlantic by the compliance with an order of President Arthur that the British flag should be saluted by the forces of the army and navy of the United States at Yorktown, "in recognition of the friendly relations so long and so happily existing between Great Britain and the United States, in the trust and confidence of peace and good will between the two countries for all centuries to come, and especially as a mark of the profound respect entertained by the American people for the illustrious sovereign and gracious lady who sits upon the British throne."*

The Yorktown Centennial.

* At one of the dinners given to the foreign visitors, Secretary Blaine was persuaded to respond to a toast in German. Now the distinguished statesman was unable to speak a sentence in that language, but one of the German guests drilled him in the hundred or so right words and sat at his elbow as he rose to his feet. Mr. Blaine started off well, but soon halted and began mixing matters. The sight of the great man stooping over with

An agreement was made among the leading nations, in 1880, to locate a number of stations in the Arctic regions for the purpose of studying the phenomena there. The two places selected by the United States were Point Barrow in Alaska and Lady Franklin Bay in Grinnell Land. Lieutenant Adolphus W. Greely commanded the expedition, which sailed from St. Johns, July 7, 1881, in the steamer *Proteus*. The understanding was that a relief party should be sent to Lady Franklin Bay in the summer of 1883. Inasmuch as supplies are unattainable in that land of desolation, such relief is indispensable in the case of Arctic explorers, and even with such assistance, a fatality seems to pursue all these ventures.

The Greely Arctic expedition.

The expedition sent out the following summer consisted of the *Proteus* and *Yantic*. Just before reaching Cape Sabine, the *Proteus* was so badly crushed by the ice that she sank, carrying down her supplies with her. The commander, Lieutenant Garlington, and his men took to the boats and managed to reach the Danish settlement of Upernavik, where the *Yantic* had been left, and now carried the party back to the United States.

It will be seen that Lieutenant Greely and his comrades were thus left in a critical situation. All their movements would be based on the certainty they felt of a base of supplies at Cape Sabine to which they could make their way in case of need, and yet there was not an ounce of food within a hundred miles of the spot.

Meanwhile the Greely expedition had reached Upernavik in the steam launch *Lady Greely* on July 23, 1881, where provisions were obtained, and two Esquimau guides and a number of dogs secured. In the following month the party arrived at Lady Franklin Bay, near which the signal station, Fort Conger, was to be erected. Rough but comfortable quarters were built, and a number of side explorations were made. Before the winter passed the temperature descended to 65° below zero,—a degree of cold beyond the power of imagination to conceive. In April Sergeant David L. Brainard started with supplies for Cape Sumner, whither he was to be followed by Lieutenant Lockwood with more supplies. The former party numbered thirteen, but the terrific cold and hardships compelled four to return. Then Lockwood and two Esquimaux were forced to go back to Fort Conger for supplies and repairs, after which they resolutely faced the fearful work before them. Finally all that were left were Lieutenant Lockwood, Sergeant Brainard, and a single Esquimau. They toiled on until stopped, May 13, 1882, by an impassable chasm. Careful observations proved that they had reached latitude 83° 24′ 30″ north, which was nearer the North Pole than had ever been attained by man.*

Great achievement of Lieutenant Lockwood and Sergeant Brainard.

The intrepid explorers named the point Lockwood Island, and finding they could go no farther, faced southward, laboring heroically against incredible hardships, until in June they arrived at Fort Conger, where they were welcomed by their comrades as if they had risen from the dead.

It is impossible to picture a more dismal and intolerable situation than that of these Arctic explorers who had nothing to do but to sit down and await the coming of the promised relief expedition. No one dreamed that the *Proteus* was to be the victim of the terrible conditions which have thus far baffled and turned back the most daring navigators that have attempted to penetrate the awful mysteries of the Arctic world.

The polar night, months in length, seemed of interminable duration. At such times the association of friends becomes unbearable, and the continual sight of loved faces grows hateful. But at last the appalling darkness was lifted, and the explorers, twenty-five in number, set out for home, August 9, 1883. They used their small steam launch, taking three boats of lesser size with them. These became useless, and discarding the launch, they placed two smaller boats on sledges and began wearily dragging them over the ice. When within a few miles of Cape Sabine several men were sent in advance, and brought back the disheartening news of the loss of the *Proteus*.

This meant another winter in the Arctic regions. The men grimly faced the ordeal, finding some encouragement in the cache of provisions that had been left by the *Neptune* the year before. Several of the men succumbed, among them the lamented Lieutenant Lockwood. The survivors could not see a ray of hope, and huddled together in their hut and awaited starvation.

A hopeless situation.

In May, 1884, a relief expedition under Commander Winfield S. Schley, left the Brooklyn navy yard. It consisted of the *Thetis*, *Bear*, and *Alert*, and upon reaching Smith Sound a steam launch made its way to Brevoort Island, where a search brought to light a letter written by Lockwood eight months before, telling of the sore straits of himself and companions, and making known where they had gone into camp. It seemed impossible that any of them should be alive, but the search was pressed with all energy, and by and by the silent tent was descried across the snowy waste. Running forward the rescuers drew aside the flap, and found seven of the original twenty-five men still alive, but so close to death that if the rescue had been delayed a few days it would have been too late. One of the seven was unable to rally, and the six survivors reached New York, August 8, 1884, just one year, lacking a day, from the time they started homeward from Fort Conger.

The rescue.

The following national candidates entered the field in 1884: Democrats, Grover Cleveland of New York, and T. A. Hendricks of Indiana; Republicans, James G. Blaine of Maine, and John A. Logan of Illinois; Prohibitionists, John P. St. John of Kansas, and William Daniel of Maryland.

The election was very close, though not of the nature of that of 1876, the situation being different. Its uncertainty was as to which candidate would secure the vote of certain States; the electoral vote would be decisive one way or other. Considerable dissatisfaction developed with the brilliant Mr. Blaine, and a good many Republicans who called themselves "Independents," refused to support him. Their opponents named them "Mugwumps," the word it is said being of Indian origin. Several causes produced slight changes in the vote of New York, which swung the total against Blaine. Thus, a personal quarrel had occurred between him and the arrogant Senator Conkling, which produced a shrinkage in the Republican vote in the district of that senator; a venomous cartoon represented Blaine as a man tatooed with dishonest schemes; the temperance vote diverted a slight but appreciable support; and finally, near the close of the canvas, a clergyman in the effort to say something alliterative and original, called the Democrats the party of "Rum, Romanism, and Rebellion." Perhaps any one of these causes would have proved sufficient to defeat the Republican candidate. Be that as it may, the few hundred votes that were turned from him, gave the electoral vote of New York to Cleveland, whose total was 219 as against 182 for Blaine. For the first time in a quarter of a century the executive government at Washington became Democratic.

The only President that was a native of New Jersey was Grover Cleveland, who was born in the little town of Caldwell, near Newark, March 18, 1837. He is the son of a clergyman, and was educated in the public schools, and taught for a time in an institution for the blind. Removing to Buffalo in 1855, he became a successful lawyer. His ability and integrity

The twenty-second President.

anxious countenance to catch the words of his prompter, and then getting most of them wrong, despite the plaudits of the listeners, was one of the most amusing pictures conceivable, and the ludicrous solemnity of the orator, who enjoyed the situation as much as his friends, completed the humor of the scene.

*This record stood until April 7, 1895, when it was broken by Dr. Fridtjof Nansen, the Swedish explorer, who touched 86° 14′, which is within 261 miles of the North Pole.

brought him the confidence of his fellow-citizens, and he was appointed district attorney, and elected sheriff and mayor. He filled these offices with such acceptance that he was nominated for governor, and elected, in 1882, by nearly 200,000 majority. The vote for him was so unprecedented that his party was convinced he was the most available man for the presidency. The result of his nomination justified this faith. As Chief Magistrate, he fulfilled expectations, his policy being guided by his obligations to the Constitution, an honorable fulfillment of his pledges, a regard for law and order and a high sense of his duty to his country. It is an interesting fact that the city of Buffalo is the only city which has furnished two Presidents of the United States.

Our past history showed a dangerous weakness in the provision for the presidential succession. Several Presidents and Vice-Presidents had died, though it never happened that both offices were vacated during the same term. Yet it is possible that such a contingency might occur. To avoid the complications and disturbance of a new national election, Congress in 1886, passed the Presidential Succession Law. This provides that in case of the removal of both President and Vice-President, through death, resignation, or inability, the order of succession shall be through the Secretary of State, Secretary of the Treasury, Secretary of War, Attorney-General, Postmaster-General, Secretary of the Navy, and Secretary of the Interior. The act applies only to such cabinet officers as have been confirmed by the Senate, and are eligible under the Constitution to the presidency: The situation contemplated by the act has not yet arisen, but is quite certain in the course of time to do so.

Presidential succession law.

Several notable deaths occurred during the first administration of Grover Cleveland. The most prominent was that of General Grant, which took place at Mount McGregor, New York, July 22, 1885. General George B. McClellan passed away, October 29, and Vice-President Hendricks, November 25 of the same year. General Winfield S. Hancock died February 9, Samuel J. Tilden, August 4, and Ex-President Arthur, November 18, 1886.

Notable deaths.

No American Indians that ever lived have surpassed in atrocity the Apaches of the southwest. None could surpass them because it is impossible, and rarely have few equalled them in this respect. Yet the truth remains that the primal cause of the fearful outrages by Indians has been, in almost every instance, the injustice of the white man.

The branch of Apaches living in Warm Spring Valley, New Mexico, were contented with their lands, gave no trouble and would not have given any trouble had they been left alone. But unscrupulous white men persuaded the Interior Department to evict them in March, 1872, and send them to a barren region near Fort Tularosa. General Howard protested so earnestly against this wrong that the Warm Spring Indians were allowed to return to their old homes. Flagrant as was the first outrage, a still greater was perpetrated when these same people were removed to the San Carlos Reservation; for not only was the soil worthless, but the region was the home of the much more numerous Chiricahua Apaches who were the hereditary and implacable enemies of the Warm Spring Indians.

Injustice to the Apaches.

The leader of the latter was the notorious Geronimo, better known to-day than any of his tribe. Like his father he was a fierce hater of the white men, and he and his warriors now raged through the southwest like a cyclone. The flaming climate was as grateful to them as to the rattlesnake crawling over the burning sands, and those dusky terrors seemed impervious to hunger and thirst. They burned and slew right and left, and the dread of Geronimo led to such a demand for protection, that determined efforts were made to kill or capture him. Although hard pressed, the wily leader could never be run to earth. Finally, he seemed to grow weary of the endless game of hide and seek, and, returning to his home, declared that he meant to be a "good Indian" for the rest of his life.

Geronimo.

If he really meant what he said, his intentions did not last long. In May, 1885, he left the reservation with two-score warriors and about the same number of women. It is said they rode more than a hundred miles before going into camp. The United States cavalry pressed them hard for several days, but the Indians eluded them and reached the mountains which were their destination. The men on the trail of Geronimo were veterans of the frontier, familiar with Indian ways and trickery, and they followed him into the mountains and in the end made him prisoner. He was held a single night and then escaped. Not only that, he returned several nights later, seized his wife from a tent in which she was held, and carried her off with him. Then his band began massacring settlers in southwestern Arizona and in Sonora.

Captain H. W. Lawton took up the pursuit, and his efforts and exploits and those of his men form one of the most remarkable records in the annals of the frontier. They pressed the Indians relentlessly, fresh men taking the place of those who were exhausted, and galloping on with renewed vigor. These pursuers were as adept in woodcraft as the Apaches, and it was impossible to throw them off the trail. The red men had no time to turn aside for raids, because the cavalry were upon their heels. Several times the warriors were compelled to leap from their horses and dash among the rocks, with the guns popping at them. The Apaches had never known anything of the kind before. They resorted to every possible device that ingenuity could suggest, but in vain. The pursuit lasted four months, during which period the pursuers rode and tramped farther than the distance from New York to San Francisco. The fugitives ran across the line into Mexico, but it did them no good, for the Mexican authorities were engaged in the same work of running down the hostiles, and their soldiers joined the Americans in the pursuit. Geronimo in the end was driven to bay, and he and his associates surrendered on the pledge that their lives should be spared. There could be no security so long as these warriors were in the southwest, even though prisoners, for they were likely to break loose at any time and go upon the war path. General Miles, who had conducted the campaign with admirable discretion and vigor, did not wait for the "Indian Ring" to interfere, but brought the captives east, where they have remained ever since. No more model Indian can be seen than Geronimo, who, at this writing, is still in rugged health, though quite an old man. Yet many a settler in the southwest would shudder, if he learned that the former Apache leader was making a simple visit to his old friends in that part of the world.

A remarkable pursuit.

All visitors to the metropolis of our country cannot fail to be impressed by the towering figure of the Statue of Liberty, which is the gift of the distinguished French sculptor Frederick Auguste Bartholdi, or rather through him of the French people. When he appealed to his countrymen, in 1874, for subscriptions, the response was generous, and on Washington's birthday, 1877, Congress gratefully accepted the testimonial of the friendship of the nation, whose services in our great struggle for independence cannot be forgotten, though there have been times when this good will has been broken. The French are a volatile people, among whom the republican of to-day may be the aristocrat of to-morrow. The popular subscriptions to this great work in France represented a hundred thousand persons.

The Statue of Liberty.

The statue was dedicated, October 26, 1886, in the presence of a distinguished assemblage, including President Cleveland, General Sheridan, and M. Bartholdi. Few who view this figure at a distance comprehend its vast size. It is of copper and the torch is 305 feet and 11 inches above low water mark, the statue itself being 151 feet in height, and the granite and concrete pedestal 155 feet. The finger nails are

more than a foot long, and the second joint of the fore-finger is five feet in circumference. The hollow torch will hold twelve men, and forty persons can stand comfortably within the head.

The whole country was startled on the night of the last day of the summer of 1886, when an unmistakable earthquake shock passed over the South and was felt as far north as Albany, N. Y. Accompanying the tremor, was the abrupt cutting off of telegraphic communication with Charleston, S. C., a fact which caused the awful fear that that city had met the fate of Lisbon more than a century before. Providentially, however, such was not the case, though the famous old historical town had been shaken to its foundations. The seismic disturbances continued into November, by which time the city had been so injured that one-half required rebuilding. Shocks of lesser force were felt in Chicago, Cleveland, and other places, and the deaths in Charleston numbered more than a hundred.

The Charleston earthquake.

Friction has developed more than once during the past century, between Great Britain and the United States, over the fishery industry in the vicinity of Newfoundland. The tension at times threatened the amicable relations of the two governments. In 1818, our fishermen were conceded the right to follow their calling, on the western and southwestern shores of Newfoundland, including those of the Magdalen Islands and of Labrador. When the regions became settled, the consent of the owners of the shores should be necessary to validate these privileges. The latter were extended in 1854, and, in compensation therefor, both nations were allowed similar rights on our coast, southward to the 36th parallel. Each was permitted the free navigation of Lake Michigan, including the American right to use the St. Lawrence within British territory. In the event of either government becoming dissatisfied with the treaty, after it had run ten years, it could terminate the same, by giving a year's notice of such intention.

The fishery question.

The agreement did not work satisfactorily to our fishermen, and the United States terminated the treaty in March, 1866. This action restored the status of 1818, with the result of increased irritation. There was ground for the British contention that their fishermen were giving more than they received. The necessity for a new arrangement brought matters to a head in 1871, when the Treaty of Washington placed matters substantially as in 1854, with the exception that the line of British privileges on our northeastern coast was moved three degrees northward. Our cousins still insisted that an unjust advantage lay with us. The contention was pressed and was referred to a Commission which met at Halifax to decide whether any compensation should be paid to Great Britain, for the inequality of benefits, and, if so, what amount was proper. The Commission, in 1877, awarded the sum of $5,500,000 to Great Britain. The decision caused great indignation in the United States, and there was a general clamor that the money should not be paid. We felt very much as did England over the fine imposed for the ravages of the *Alabama* during the Civil War. Like her, we paid the money, recalling as we did so, the old proverb that it makes a big difference whose ox is gored.

The Halifax award.

The United States served legal notice, and the treaty was terminated, July 1, 1885. Once more the old agreement of 1818 became operative, and the friction continued. An attempt was made in 1818, to adjust matters through a new treaty, but the Senate —sometimes called "the graveyard of treaties"— refused to concur, and the effort came to naught.

To Secretary of State James G. Blaine is due the credit for the Pan-American Congress, which assembled in Washington in October, 1889, in accordance with an act of Congress of the previous year. Representatives were present from the United States, Mexico, Central and South America, Haiti, San Domingo, and the empire of Brazil. The principal questions discussed related to the establishment of an international bank; protection of copyrights and patent rights; granting of subsidies to steamship companies, and the adoption of an extradition treaty. The representatives agreed to recommend to their governments the adoption of a uniform system of weights and measures, a uniform commercial coinage, a common method of legalizing documents, and reciprocity treaties among the respective States. Little, or nothing has resulted as yet from the action of the Pan-American Congress, but it is not unlikely that it sowed the seed, which one day will bear beneficent fruit.

The Pan-American Congress.

One of the most important, and thus far insolvable questions that has confronted our country, almost since its foundation, is the amicable adjustment of the relations of capital and labor. Arbitration has served admirably between nations, and often between individuals, but more rarely than could be hoped in the disputes of employers and employees. Worst of all, most of the strikes have been accompanied by violence, wanton destruction of property, and bloodshed. As long ago as 1803, the sailors in New York struck for an increase of wages, and indulged in so much rioting that the town guard had to be called out to repress them. Few understand how numerous labor strikes have been. Down to 1880, there were 1,500, not counting many of minor importance, and from 1881 to 1886, according to the government report, 3,902 strikes occurred in which nearly a million and a half of men were involved, the money losses being stupendous.

Capital and labor.

The two most famous strikes during the first administration of President Cleveland were those of the Reading Railway and of the Brotherhood of Locomotive Engineers. On December 20, 1887, the Knights of Labor called out 6,000 employees of the Philadelphia and Reading Railway. The cause of the strike was the refusal of the company to recognize officially this great labor organization. The idle employees grew to 30,000 in number. Their places were taken by non-union men, and the railway company never conceded the point demanded by the strikers, some of whom returned to work, but a great number were obliged to seek employment elsewhere.

The Reading strike.

The Brotherhood of Locomotive Engineers is one of the most conservative labor organizations in the country. Striking is the last resort with it, and that means of righting what they believe to be wrong has been seldom employed. At the beginning of 1888, the strike of the Brotherhood engineers began on the Chicago, Burlington, and Quincy Railroad. By the opening of May, the cost of the strike amounted to more than $3,000,000, of which the far larger portion fell upon the employees. The engineers and firemen who went out were 1,053 each, besides 400 switchmen. Only a few were allowed to return to work, and the heavy assessments upon the Brotherhood treasury caused trouble. A good many Knights of Labor took the places of the striking engineers, because of which a spirit of hostility developed between the two organizations. The strikes that have taken place since then are too numerous for mention.

An evil feature in most of the strikes is the opportunity given for the commission of crime by miscreants who have not the slightest interest in the cause of labor. Many of those who bring disrepute upon the workingmen are such chronic idlers and desperadoes, though it cannot be denied that some strikers and some employers as well have been flagrant lawbreakers.

An inevitable result of the indiscriminate immigration which has been permitted from the beginning, and which has brought 22,000,000 foreigners into our country since 1820, has been the importation of thousands of the worst criminals of the Old World. While the majority of immigrants have passed on to the West, to help build up and develop that section, these lawless ruffians have swarmed into the large cities to plot

The Anarchists.

and murder, not sparing even the President of the United States. The Anarchists are atheists and the avowed foes of religion, morality, society, and government. Their ideal is chaos and their presence is a menace to any nation.

Rioting in Chicago.

In 1886, the workmen in New York and Chicago, chiefly factory hands, freight handlers, brick-makers, iron-workers, and lumbermen, struck for a reduction from ten to eight hours a day. Here and there a compromise was made, but in most instances the demand was refused. An army of workmen went out in Chicago, and on May 3 a large number made an attack upon the McCormick Reaper Works. News of the rioting was sent to police headquarters and a patrol wagon, containing a dozen policemen, was driven to the spot with the horses on a gallop. The mob replied with jeers to the order to disperse, and when the officers fired over their heads, they began stoning the policemen. Then several rioters were hit by the bullets of the officers, and reinforcements enabled the officers to drive back and disperse the rioters.

The opening thus presented for the devilry of the Anarchists was eagerly seized by them. On the second night following the outbreak referred to, several thousand men and boys gathered at the old Haymarket Plaza, having been urged to do so by a number of circulars printed in German and English. Nearly all these persons carried firearms, for serious trouble was regarded as certain. A sullen mob was growing more excited under the venomous appeals of an Anarchist, who was standing in a wagon, gesticulating wildly and shouting at the top of his voice. In the midst of his harangue, the inspector of police and a column of officers forced their way through the crowd, and ordered the speaker to stop, and the mob to disperse. The expected reply came in the form of stones, missiles, and hooting. The officers bore it until patience ceased to be a virtue, and then they began vigorously using their clubs. All was in tumult, when one of the mob threw a dynamite bomb in front of the policemen, where it exploded. The effect was horrible. Seven of the brave men were instantly killed, and more than twenty wounded, many of them for life. Instead of being stunned or panic stricken, the inspector and remainder of his men charged the rioters with resistless vigor and scattered them like so much chaff.

The Haymarket massacre.

The leading criminals in these murders were identified and brought to trial. Their guilt having been clearly proved four were hanged, while others were condemned to long terms of imprisonment. When Governor Altgeld came into office some years later, he pardoned every one of the Anarchists, his pretext being that they had not had a fair trial. Never was the guilt of any criminal more clearly established. The governor unfortunately was in sympathy with these enemies of society, who, in point of fact, are not confined to any nationality. It is a noteworthy fact that the "Haymarket massacre" proved for a time an almost fatal blow to anarchy. Little or nothing further was heard of the doings of the Anarchists for several years, and no crime of any extent could be charged against them. But that they were still among us and still plotting evil we were destined to learn in the most terrifying manner conceivable.

The tariff assumed importance during the first administration of Cleveland. The first general revision was in 1883, when the proposed act underwent many changes in the House and Senate, resulting finally in a compromise. In his message to Congress, in December, 1887, the President gave special attention to the question. A considerable surplus had accumulated in the Treasury, so that a reduction of the tariff could be made without injuring the revenue. This state of affairs was contrary to the principles of the Democratic party, but a minority had helped in maintaining a high tariff. The majority, however, carried the Mills Bill, which reduced duties, through the House of Representatives, but it was defeated in the Republican Senate. The question became an issue in the following election, but the result was not decisive, though, as we shall see, the national Republican ticket was successful. We may add that the McKinley Tariff Act was passed in 1890, and was the result of President Cleveland's attack on the high protective system. It abolished the duty on sugar, all raw sugar being admitted free. Until then nine-tenths of the sugar had been made abroad. The rate of the previous duty was two cents a pound, which was now paid to the domestic sugar producers. The duty on raw wool was slightly increased, and that on woolen goods considerably advanced. The most important change was the raising of the duty on tin plate. Hitherto this metal had never been produced in the United States, but was largely imported from England. The duty was advanced to about seventy per centum. It therefore was not a protection to an existing industry, but virtually created a wholly new industry. The act, named after its author Congressman William McKinley, was distasteful to the enemies of high protection, and naturally was denounced by foreign nations.

The tariff.

The McKinley Bill.

The Interstate Commerce Act of 1887 was one of the most important laws passed by Congress. All the railway lines entering more than one State were placed under the supervision of a commission consisting of five persons, whose duty it was to prevent any unfair discrimination of transportation rates for freight. This has proved highly beneficial. The clause of the act, however, which abolishes the abuse of free passes on railway lines, is virtually a dead letter.

The Interstate Commerce Act.

A treaty made with China in 1868 bound the United States to give to all Chinese immigrants "the same privileges, immunities, and exemptions in respect to travel and residence as may be enjoyed by the citizens and subjects of the most favored nation." An influx of Mongols began, most of whom settled on the Pacific coast. These men displayed traits which made them highly unpopular with other nationalities. They were able to live on a few pennies a day, and to save money from wages upon which Americans, Irish, and Germans would starve. They were meek, unresisting, and patient, but industrious and cunning. Many displayed a shrewdness that was more than a match for the keenest minded Caucasian. In addition, they are capable of incredible depravity. The vileness of the Chinese quarters in some of our large cities is such as brought down the wrath of heaven upon Sodom and Gomorrah. California became so angered because of the unceasing stream of yellow immigrants which poured upon her shores that she demanded its stoppage. Congress, in 1879, had passed a bill restricting Chinese immigration, but it was vetoed by President Hayes. The Chinese government in 1880 agreed to a partial restriction of such immigration, but was so tardy in ratifying the new treaty that in 1888 a law was enacted which prohibited all immigration of Chinese into the United States. President Cleveland signed the act, which is still in force. While the law is largely effective, the phenomenal cunning of the Mongols enables them in many instances to circumvent it. If the stream has been dammed, a rivulet still percolates under the walls. To many it has seemed that the law named is a violation of the treaty of 1868, but the Supreme Court holds that such exclusion is a sovereign right which cannot be affected by any treaty.

Chinese Exclusion Act.

We remember that in 1867, when a bitter quarrel existed between President Johnson and Congress, that body passed the Tenure of Office Act, which prevented the Chief Executive from making any removals from office without the consent of the Senate. President Cleveland, for reasons which he deemed sufficient, displaced a certain district attorney. The Senate demanded the cause for this action, and called for the papers in the case. The President not only refused to comply, but declared the act un-

Repeal of the Tenure of Office Act.

constitutional, and gave such cogent reasons for his views that at the next session Congress repealed the act.

As has been stated, the Presidential Succession Law was passed during the first administration of President Cleveland. The dangerous contingency which arose in 1876 was effectually guarded against by an act providing for the counting of electoral votes. The decision is placed so far as possible with the State courts. When that cannot be done it rests upon the concurrent action of the two branches of Congress, acting separately. In the event of their failure to agree the votes certified by the governor of the State shall be accepted. It would seem that with the passage of this law every possible safeguard has been provided against such perils as have menaced the country over this important matter.

Law for the counting of electoral votes.

Action upon the interesting question of Woman Suffrage antedates and follows the first administration of President Cleveland. Such suffrage upon equal terms with men at all elections was established in Wyoming in 1869; in Colorado in 1893; in Utah in 1895, and in Idaho in 1896. In Kansas the woman school law went into effect in 1861, and municipal suffrage was established in 1887. Montana in 1887 allowed women to vote upon the issuance of municipal bonds, and Iowa did the same in 1894. All the attempts to grant women the privilege of voting for presidential electors have been defeated, though such right will doubtless be conceded sooner or later. Female school suffrage prevails in Michigan and Minnesota (1875); New Hampshire and Oregon (1878); Massachusetts (1879); New York and Vermont (1880); Nebraska (1883); Wisconsin (1885); Washington (1886); Arizona, Montana, New Jersey, North Dakota, and South Dakota (1887); Illinois (1891); Connecticut (1893); Ohio (1894).

Woman Suffrage.

The year 1888 saw the following presidential and vice-presidential candidates in the field: Democrat, Grover Cleveland and Allen G. Thurman of Ohio; Republican, Benjamin Harrison of Indiana, and Levi P. Morton of New York; Prohibition, Clinton B. Fisk of New Jersey, and John A. Brooks of Missouri; Union Labor, Alson J. Streeter of Illinois, and C. E. Cunningham of Arkansas; United Labor, R. H. Cowdry of Illinois, and W. H. T. Wakefield of Kansas; American, James L. Curtis of New York, and James B. Greer of Tennessee. None of these candidates, outside of the leaders, received any electoral votes. The Republicans were successful, securing 233 votes to 168 cast for the Democrats.

Presidential election of 1888.

Benjamin Harrison, like every Republican President thus far elected since Abraham Lincoln, was a native of Ohio, having been born at North Bend, August 20, 1833. What a remarkable distinction came to the honest farmer who was his father, for *his* father and son were each President of the United States, and his grandfather was a signer of the Declaration of Independence. Benjamin received good educational advantages and was graduated from Miami University in 1852, after which he became a lawyer and made his home in Indianapolis. He volunteered early in the Civil War, and won the commendation of his superior officers for his bravery, devotion to duty, and thorough efficiency, and attained the rank of brigadier-general. Mr. Harrison ranks as one of our best Presidents. He was an able statesman, and not the slightest taint attached to his administration. He had no superior as an off-hand speaker, his numerous addresses, delivered in the most diverse circumstances, being models of grace, eloquence, and excellent English, and were marked by exquisite taste. He was reserved and somewhat cold in his manner, and it was said of him and an associate with similar traits, that they "froze together." Yet he was gentle hearted and possessed the finest sensibilities. Above all he was a humble Christian, always mindful of his religious duties, and amid the trials and responsibilities of his high office, he never swerved from the obligations of his sacred profession.

The twenty-third President.

A remarkable naval disaster occurred on March 15, 1889, in the harbor of Apia, Samoa. A number of American and German warships were anchored near one another, when, without any warning, a resistless tropical hurricane swept down upon the vessels. They started their engines, but though driven at their highest power, they were unable to stem the force of the gale and began dragging their anchors. The German gunboat *Eber* resisted desperately, but she was hurled with tremendous force upon a coral reef and "turned turtle." The Samoans, who looked upon the Germans as their enemies, as indeed they were, forgot their resentment at sight of the struggling ones, and dashing into the waves, rescued one officer and four men, but five officers and sixty-six men were drowned. The German flagship *Adler* was tossed about like a cork, flung to the top of a reef and then tumbled upon one side, twenty men being drowned or killed in a few minutes. The others, about a hundred in number, swam through the raging waters to the wreck, where they clung until rescued.

Naval disaster at Samoa.

The American steamer *Nipsic* escaped through fine seamanship. With a skill that could not have been surpassed, she dodged the reef and helpless vessels and was beached. The German corvette *Olga* seemed to regard each of the vessels as a target, and bumped into nearly every one, before she reached a sand flat upon which she was flung. Fortunately for the British corvette *Calliope*, she had engines of exceptional power. Slipping her cables, she headed into the teeth of the gale, and crowded on every ounce of steam. At first she slowly yielded, then by the utmost exertion held her own, began gaining inch by inch, and finally reached the open sea where she was safe.

The U. S. steamer *Vandalia* was swept on a reef near shore and sank. Many attempted to swim to land, but were drowned. Others climbed into the rigging, but some time after, the *Trenton* shot past and knocked them off, some falling into the water and others on the deck of the *Trenton*, which was dashed upon the beach. The American losses were: on the *Nipsic* 7 men; the *Vandalia* 5 officers and 39 men, and the *Trenton* 1 man. The independence and neutrality of Samoa were guaranteed, June 14, 1889, by the United States, England, and Germany.

At irregular intervals, the leading civilized countries, where it would seem such things ought to be impossible, are horrified by calamities, attended with a fearful loss of human life. Almost without exception, these disasters are due to criminal negligence, and a disregard of the simplest rules of prudence. Despite the shock and indignation that thrill the people, it rarely or never comes about that the guilty ones receive more than a nominal punishment, and sometimes not even so much as censure. The frequent miscarriages of justice, and the acquittal of men, possessing what is vulgarly termed a "pull," are a direct incitement to wrong doing and crime, and would be a reproach to any nation; with less claims to civilization than ours.

About forty miles southwest of Altoona, Pennsylvania, is the city of Johnstown, and eighteen miles away, at the head of a beautiful valley, was Conemaugh Lake, two and a half miles long and a mile and a half wide. This largest reservoir of water in the world was held in check by an immense dam, nearly a quarter of a mile wide. There was a good deal of distrust of the structure and Johnstown had been alarmed more than once by signs of its yielding. It is well known that the pressure of water to the square inch or foot depends wholly upon its depth. When we reflect that the height of this dam was more than a hundred feet, a faint idea of the stupendous force forever pressing against it may be formed.

The Johnstown disaster.

On the 31st of May, 1889, the dam suddenly slipped forward and set free the vast reservoir behind it, which rushed down the valley faster than any light-

ning express ever thundered. The torrent traveled eighteen miles in seven minutes, flinging trees, houses, rocks, and even massive locomotives into air, as if they were so many footballs. It descended upon Johnstown like an avalanche, but was stayed when, loaded with debris, it collided with the railway bridge below the city. That stood like the Eddystone lighthouse, seemingly powerful enough to await the crack of doom. The houses thus checked took fire, and hundreds imprisoned within were burned to death. In some instances, victims of the Johnstown flood were not found for two years. The total number of dead accounted for down to 1904 is 2,274.

Oklahoma, signifying in Indian "beautiful land," was carved from what was formerly the western section of Indian Territory, and most of it was ceded to the United States by Texas in 1850. Its fertility and salubrious climate drew general attention and a good many attempts were made by emigrants to secure homesteads. This was in violation of our treaty with the Indians, and government forces, as in duty bound, ousted the intruders. Others persisted in entering the forbidden land, and finally a body of armed settlers defied the authorities. It was a mad act, as they speedily learned, for they were hustled across the border and taught that it is a rash thing to trifle with the United States government.

Opening of Oklahoma to settlement.

The value of the land, its attraction to settlers, and the fact that the Indian owners could well afford to part with it, caused negotiations to be opened with the Seminoles, Creeks, Cherokees, Iowas, Kickapoos, Pottowatomies, Sacs, and Foxes, for the surrender of their titles. This being effected, President Harrison issued a proclamation, opening a large portion to settlement, and designating the 22d of April, 1889, at noon, as the hour when intending settlers could legally enter the domain. The scenes which followed were unprecedented in our history. Thousands of men and women gathered on the boundary line, coming from all directions, and impatiently awaited the signal for permission to cross. Some of these edged over, but were sternly driven back. The multitude thus congregated on the margin of Oklahoma numbered more than 50,000, all burning with eagerness to open the race for new homes. When at last the sun touched the meridian, and the bugles sounded, the mad rush began. Horsemen sent their animals flying at headlong speed, the riders keenly scanning the country as it opened before them, in the search for favorable locations. When one of them fixed upon a spot, he plunged toward it, threw his horse on his haunches, leaped out of the saddle, and immediately began staking out his claim. Those who were on foot panted forward and were equally ardent in the scramble. A few had managed to elude the vigilant guards and were already on the ground. A number of wrangles and collisions took place, but there were enough sites for all and more. In the morning, not a soul was to be seen on a certain spot; at night, Guthrie with 10,000 population had begun its existence there. Oklahoma was organized as a Territory, May 2, 1890. Later proclamations have thrown open other portions to settlement, and it has become the most populous of all the Territories. Guthrie, the capital, is the centre of commercial and political activity.

Oklahoma, and parts of Kansas and Nebraska, were included in the section, which, by act of Congress in 1830, was set apart as the Indian country. Since then so much has been organized into new States and Territories that only a fraction of the original division remains. Still its area, with its twenty-five reservations, is more than six times as great as the State of Connecticut. In the Territory, organized June 30, 1834, live the Cherokees, Chickasaws, Choctaws, Creeks, Arapahoes, Cheyennes, Kiowas, Comanches, Wyandottes, Sacs, Foxes, Pottowatomies, Shawnees, Senecas, Seminoles, Ottawas, and several less important tribes. Few of these Indians are of pure blood, the mixture being white men and negroes. The location of Indian Territory made slavery legal within its borders, and many of the civilized and wealthy Indians owned slaves. They joined the cause of the Confederacy during the Civil War, and were impoverished, but like the southerners, soon rallied, and have rapidly improved their condition. The existence of an independent and alien government in the centre of our republic is an anomaly which is destined to pass away at no distant day.

The Indian Territory.

Six States were admitted into the Union during Harrison's administration. Two of them, North and South Dakota, came in together, November 2, 1889. The word means "confederated," and the section was named from the Indian confederation. Originally a part of the Louisiana purchase, the Dakotas were attached to Louisiana Territory in 1805; to Missouri in 1812; to Michigan in 1834; to Wisconsin in 1836; to Iowa in 1838; and to Minnesota in 1849. On old maps the extensive area is represented as the Mandan region, from the Mandan Indians, who were succeeded by the Dakotas. Lord Selkirk, believing the country to be a part of Canada, founded a Scottish settlement at Pembina in 1812, but the error being discovered the colony about ten years later removed to Manitoba. The western portion became a part of Nebraska Territory in 1854, and on March 2, 1861, Dakota Territory was formed, including, in addition to the two Dakotas, portions of Wyoming and Montana, which were joined to Idaho in 1863. The Indians had ceded 25,000 square miles in the southeast to the United States in 1858, and settlers began entering the region shortly afterward. The division into North and South Dakota was made by Congress, February 20, 1889. In 1890, 11,000,000 acres of the Sioux reservation, and in 1891, 1,000,000 acres of the Sisseton reservation, South Dakota, were opened by the United States to general settlement. The two States were admitted, November 2, 1889.* The world wide fame of Dakota wheat made each division unwilling to surrender the distinctive name, and the titles were a compromise.

The Dakotas.

The word "Montana" is Spanish, and means "mountain lands." Originally a part of Idaho, it was made a Territory, May 26, 1864, and in 1873 some two thousand miles were added from Dakota. Four of the great rivers of North America have their sources in Montana, and the course of one of them, the Yellowstone, is within its border. More than a fourth of the length of the Missouri lies in Montana, and the waters which form the Columbia gather in the western portion, while the Saskatchewan takes its rise in the northwest. Thus Montana sends waters to the Pacific, the Gulf of Mexico, and Hudson Bay. The country has become the chief copper region of the world, and its wealth in that metal, and in gold, silver, and lead, is beyond measure. Its rapid growth began with the opening of the gold mines in 1861. Montana has been the battle ground of some of the most sanguinary conflicts with Indians in recent years. The Custer massacre occurred, June 25, 1876, when the Seventh United States Cavalry was almost annihilated. Montana became a State, November 8, 1889.

Montana.

Three days after Montana, Washington was admitted into the Union. Its history is interwoven with that of Oregon, which was discovered by Spanish navigators in the sixteenth century. In 1852, Oregon was divided along the Columbia River and Washington was erected into a Territory the following year. At that time, it included Idaho and portions of Montana and Wyoming, but its present limits were made in 1863. As has been stated elsewhere, the valuable island of San

Washington.

*When the documents admitting the Dakotas were laid before President Harrison for his signature, he covered both down to the blank spaces for his name, turned them face downward, and shuffled them about until their identity was hopelessly confused. They were then turned over and signed. When the ink was dry the papers were once more turned and shuffled until no one could tell them apart. Thus, although one of the Dakotas is a few seconds older than the other, the secret will never be revealed. North Dakota is the thirty-ninth and South Dakota the fortieth State in all printed lists, but this is because of alphabetical precedence.

Juan was claimed by England, and the question being submitted to Emperor William I., he decided in 1872 in favor of the United States.

Idaho was first explored by Lewis and Clark in 1805–6, and the Missouri Fur Company established trading posts at various points in 1834. Idaho. The immense region west of the Mississippi was organized into Territories after the Louisiana purchase, all lying north of California and beyond the Rocky Mountains being called Oregon Territory. When Washington was formed in 1863, it included the present State of Montana and nearly all of Wyoming. It became a State, July 3, 1890.

Wyoming, which was admitted into the Union, July 11, 1890, has had a very "mixed" history. Originally a part of the Louisiana purchase, it was a Wyoming. portion of Louisiana Territory until 1812, when Missouri Territory was formed. It belonged to the Indian country after 1834; to Nebraska after 1854; to Dakota after 1861; to Idaho after 1863, and to Dakota again after 1864. Wyoming Territory was organized in July 1868, from southwest Dakota and portions of Idaho and Utah. It was first visited by Canadians in 1743–44, by American trappers sixty years later and then by employees of the Missouri Fur Company. Mormons settled in Green River Valley in 1853. The first Territorial legislature, assembled at Cheyenne, in October, 1869, conferred woman suffrage upon the same conditions as those enjoyed by men. The Indians caused much trouble, but were subjected by General Crook in 1876–77.

The last decade of the nineteenth century, when reached, showed a marvelous progress and development, such as marks the history of no other nation. Material progress. In 1800, the area of our country was 827,844 square miles; in 1890, this had grown to 3,025,600 square miles, which does not include Alaska and the islands belonging to us. The population of slightly more than five millions, had increased ten-fold, while the wealth showed a still more remarkable growth, demonstrating the amazing development of all manner of industries. In 1890, the miles of telegraph poles and cables would reach seven times round the world, and the miles of wire would have circled it twenty-seven times. The railway tracks would have reached three-fourths of the distance to the moon.

The Americans are the greatest inventors in the world. Their ingenious conceptions cover every field, and, while the vast majority of inventions never pay the cost of procuring a patent, some have proved enormously profitable. It is hardly possi- Inventions. ble to estimate the value of Eli Whitney's cotton gin, invented near the close of the eighteenth century. No single machine ever produced such a marked effect upon the industrial development of our country. It will be interesting to recall some of the special inventions made in former and later times.

The first patent granted on this side of the Atlantic was in 1650, to a resident of Lynn, Massachusetts, the grant of course being by the English crown. The first steam engine was set up in Philadelphia in 1773, and four years later, Oliver Evans obtained a patent for making steam engines. In 1790, the first American patent law was passed, and the first American patent issued. In 1797, a citizen of New Jersey patented a plow, since which time the patented improvements of this useful utensil number several thousand. Thomas Jefferson, the author of the Declaration of Independence, tried his hand in making the plow more useful than the early cumbrous model.

The automobile, which has become so popular everywhere, is a much older invention than is generally supposed, a patent for one having been obtained by Captain Trevithick as long ago as 1802. The original machine was a very crude contrivance, but the great obstacle to its use was the universally bad roads. In 1827, the principle of the first sewing machine was patented, and two years later a patent was taken out for the first typewriter. As has been stated, Obed Hussey obtained a patent for a reaper, and a year later Cyrus McCormick patented his much more successful machine. In 1835, Samuel Colt invented his revolver. The first public telegram, as we remember, was sent in 1844, and in the following year, Hoe produced his type revolving machine. The first practical sewing machine was patented in 1846, by Elias Howe, and B. F. Palmer obtained in the same year a patent for a wooden leg. Woodruff's sleeping car was patented in 1856, to be succeeded by more popular forms of construction. Ten years later, the first American patent for a bicycle was taken out. The year 1872 saw the invention of the automatic air brake, and the perfection of the duplex telegraph. The first gasoline automobile was made in this country in 1873, and the following year Edison invented his system of quadruplex telegraphy.

Americans had now invaded the limitless field of electrical phenomena in which the discoveries and inventions are of the most marvelous nature. These have gone on at such a rate that the present century is certain to advance farther into the unknown than was ever dreamed of before. In 1876, A. G. Bell was just in time to head off several other inventors in securing a patent for his telephone. In 1885, the first electric railway was put in operation. This motor has become so popular that it promises to supplant steam, even on the railway lines. In truth, the scientific world seems to have entered upon a series of discoveries that must bring to light many of nature's profoundest secrets that have hitherto been regarded as beyond the reach of human investigation.

Among the first subjects to which our forefathers gave attention was the important one of education. As early as 1622, Virginia attempted to Education. establish a school and university, but hostile Indians interfered and it came to naught. In 1633, the first schoolmaster arrived in New Amsterdam, and the Collegiate School of the Reformed Dutch Church was founded. This institution has preserved a continuous existence to the present time. Two years later, several schools were established in New England, among them the Boston Latin School which still flourishes. The year 1636 saw the founding of Harvard College, and of Symmes's famous school in Virginia. In 1638, the first school was opened in New Haven, and two years afterward one was started in Rhode Island. Within a year others followed at Ipswich, Salem, and Hartford. In 1650, Plymouth provided itself with schools, and in 1660 Providence opened one. The years 1667 and 1669 saw the founding of several private schools in Virginia, which were very successful during the colonial period.

The little town of Newark, New Jersey, opened several schools in 1683, and the early settlers in Pennsylvania did not neglect the proper education of the young. The College of William and Mary, the second on this side of the Atlantic, was founded in Virginia in 1693. In the same year, the province of New Jersey passed a law providing for schools, and in 1698, the Penn Charter School was established in Philadelphia. Yale College dates from 1701, and Princeton College from 1746. The well-known Columbia College, of New York City, was first known as King's and was chartered in 1754. Brown University is ten years the junior of Columbia, while Rutger's College came into existence in 1770.

No school book ever published has had so great a sale as Webster's Spelling Book, several million copies having been issued since it first appeared, in 1783. Its author was the famous lexicographer, whose dictionary has been one of the standards for many years on both sides of the Atlantic.

New York founded its Public School Society in 1805. The first practical step to check the ravages of intemperance was the organization of a temperance society in 1813. The next year, The cause of temperance. a public meeting was held in Massachusetts to consider the most effective measures that could be employed against the spread of this evil.

Not everyone to-day understands how universal the drink habit was, down even to the middle of the nineteenth century. Leading citizens, and even clergymen, indulged to a certain extent, but undue indulgence was condemned by all except the victims of the destroying habit. These efforts to stop the ruinous evil resulted in a great amount of good, and multitudes were saved from destruction. In 1826, the principle of total abstinence was introduced at Andover, Massachusetts, and in 1827, the American Society for the promotion of temperance was founded in Boston.

A marked advance was made in the education of girls in 1821, by the founding of Miss Willard's Female Seminary in Troy, and that of Catherine Beecher's Young Ladies' Seminary in Hartford in 1822. These institutions were not only eminently successful themselves, but they led to the establishment of similar schools in different parts of the country, and, in a few instances, in foreign countries. Miss Beecher's school for young ladies was founded in Cincinnati in 1832, and the American Anti-Slavery party was organized during that year. The famous Mount Holyoke Seminary was started amid the "hard times" of 1837.

Female education.

Normal schools for preparing teachers for their profession have become one of the most potential factors of education. The first two in this country were opened in 1839. It was fortunate that these pioneer institutions came under the control of men specially gifted as educators, and the impulse thus given to the proper training of the instructors of youth was of the most beneficent character. Normal schools soon became recognized as an indispensable feature in the preparation of teachers for their work. The founding of colleges and professional and industrial schools, as well as the advancement in public school accommodations and methods, have been so marked and numerous that space will permit no further reference to them in this place.

Normal schools.

George Peabody, in 1867 and 1869, provided a fund of $3,500,000, to be applied for the purposes of education in the Southern States. These States had been so impoverished by the war that no charity was more needed, and none was calculated to do so much real good. Of the amount named, $1,380,000 was in Mississippi and Florida bonds, and neither was available, because Florida issued her bonds when a Territory, and their legality had never been acknowledged by the authorities, while Mississippi had repudiated her bonds. This State was thus given another illustration of the truth that honesty is the best policy. The fund was placed in the control of fifteen trustees. The first object of the fund was the encouragement and establishment of public school systems for the free education of children, which having been accomplished, the income is now devoted to the training of teachers.

The Peabody education fund.

Mr. John F. Slater, in 1882, placed $1,000,000 in the hands of trustees to be applied to the uplifting of the former slave population of the South. No part of the principal or income can be used for lands or buildings, but is devoted to the preparation of teachers and education in industries. The fund under skillful management has increased one-half, without any decrease of its annual appropriations, which are made to schools established by States, denominations, or individuals.

The John F. Slater fund.

Our ancestors were too busily occupied by the strife for existence and the improvement of their material condition to give much attention to literature. There were many men of education and culture, however, among the early New Englanders who left valuable and instructive narratives, histories, and chronicles. A favorite method, until some time after the Revolution, among controversialists was to publish their arguments in the form of pamphlets. The newspapers of those times were too restricted in capacity to admit the full "views" of the various debaters; but, when the latter issued their arguments at their own expense they had the advantage of saying what they chose, and, at what length they pleased, even though the readers were less in number than those who confined their attention chiefly to the newspapers. Among our forefathers, who published or left behind them meritorious manuscripts, were John Cotton, Increase Mather, William Bradford, Edward Winslow, John Mason, Roger Williams, and Thomas Hooker. The fervid days, immediately preceding the Revolution, produced a series of speeches and pamphlets from such able men as Benjamin Franklin, James Otis, Samuel Adams, John Adams, Thomas Jefferson, Thomas Paine, Richard Henry Lee, Peyton Randolph, John Jay, Alexander Hamilton, and many others.

Literature.

Pre-eminent among the wits, philosophers, and scientific writers was Benjamin Franklin. His fame, and that of Jonathan Edwards, the theologian, is world wide and for all time. Virginia produced several historians of ability, such as William Byrd, Robert Beverly, and William Stith. In 1705 a creditable history of colonial Virginia was published, and *Poor Richard's Almanac*, which acquired great popularity, appeared in 1733. Ten years later Franklin established in Philadelphia the first literary periodical in this country. In 1797, Charles Brockden Brown published his first book. It showed no marked merit, and the author is chiefly remembered as the pioneer in the field of American fiction, though a certain popularity still clings to some of his productions.

The early years of the nineteenth century brought forward J. Fenimore Cooper, whose romances of the sea and backwoods stamp him as a genius. His pictures of frontier life, of the forest, the prairie, and mountains, charmed not only his own countrymen, but all civilized peoples. His books have been translated into the principal foreign languages, and will always be admired. His single character, "Leatherstocking," would have immortalized him, for it is one of the foremost creations in all fiction. Washington Irving was noted for his delicious humor and graceful style; William Cullen Bryant has thus far had no superior among American poets, but hardly inferior to him were Henry W. Longfellow, John G. Whittier, Oliver Wendell Holmes, and Edgar A. Poe. Nathaniel Hawthorne gave us a perfectly classical grace of style, and Emerson, Lowell, Prescott, Bancroft, Motley, and Parkman were giants in their special fields. They give a preeminence to the first half of the nineteenth century, which is peculiarly its own, and has not been equalled since that time.

A hundred years of actual test in every conceivable condition that could arise, and amid all possible environments, has demonstrated the statesmanship and political wisdom of the framers of the Constitution. No combination of the insert of minds could foresee all these new and changing conditions, and provision, therefore, had to be made for them as they presented themselves. But the instrument had its profound interpreters, and when the necessity arose, the needed Amendments were made, or the "elasticity" of the Constitution itself was found to serve its purpose.

The unwritten Constitution.

In the course of years certain customs have acquired the force of constitutional law. Thus it is the voice of the unwritten Constitution that no State has the right of its own initiative to secede from the Union; that presidential electors have no discretion in voting for candidates, but must vote for their party nominee (when Blumer of New Hampshire, a Monroe elector, voted for John Quincy Adams, he really obeyed the wishes of his party, for reasons that have been given); that a member of the Federal House of Representatives must reside in the district which he represents; that the committee system of conducting business shall prevail in both branches of Congress, the members of the committees in the Senate being elective, while in the House they are appointed by

the Speaker: that the course of party action in a legislature may be determined by caucus, and every member participating in such caucus is bound by its decision. The Constitution is not inflexibly rigid, and it can expand by construction and usage, and in matters really national it can exercise such original and inherent powers as pertain to any sovereign nation. In no other way would representative government be able to operate over an expanded territory.

PART II.—PHYSICAL GEOGRAPHY AND STATISTICS.

Copyright, 1904, by The Werner Company.

Location, Area, etc.

The United States occupy the central part of the northern half of the western continent. They are bounded and washed on the east by the Atlantic Ocean, on the west by the Pacific, on the north by the chain of the great lakes, and on the south by the Gulf of Mexico. The territory embraced in the domain of the government extends through 24° 30′ of latitude, and 57° of longitude. The southernmost point of the country is Key West, Florida, and the northernmost the country abutting on the Georgian strait in Washington. The southernmost and northernmost parallels of latitude are 24° 32′ and 49°, respectively, and the easternmost and westernmost meridians of longitude are the 67th and 124th. The greatest breadth of the country is about 3,100 miles, and its greatest length from north to south about 1,780 miles. The Russian cession of Alaska having completed the area of the United States up to 1870, the census of that year gave the following summary of the country's area: Originally, as limited by treaty with Great Britain (1783), this area, expressed in square miles, was (after the cessions of States to the United States), in the States, 420,892; out of the States, 406,952,—in all, 827,844. The additions were (1803), from France, the province of Louisiana, 1,171,931; (1819) from Spain, Florida, 59,268; (1845) the Texan annexation, 376,133; (1848) the first Mexican cession, 545,783; (1853) the second Mexican cession, 45,535; and finally (1867) the Russian cession, Alaska, 577,390,—making the total area of the United States 3,603,884 square miles.

Table I.—Area, Population, and Density of Settlement, 1870.

	States and Territories.	Square Miles.	Persons.	Persons to a Square Mile.
	The United States	3,603,884	38,558,371	10.70

It should be noted here (1) that the land surface of the United States when increased by the water surface of the great lakes and rivers, gives a total area of about 4,000,000 square miles; and (2) that the excess of the total area at 1870 over the total area of 1860 represents the Russian cession of Alaska; the excess of 1860 over 1850, the second Mexican cession, or Gadsden Purchase; the excess of 1850 over 1840, the Texan annexation and first Mexican cession; and the excess of 1810 over 1800, the French cession, or Louisiana Purchase.

The following table shows the area in square miles of the States and Territories, together with the land and water surfaces, according to the United States census of 1880:

Table II.—Land and Water Surface by States and Territories.

States and Territories.	Gross Area.	Water Surface.	Land Surface.
Alabama	52,250	710	51,540
Arizona	113,020	100	112,920
Arkansas	53,850	805	53,045
California	158,360	2,380	155,980
Colorado	103,925	280	103,645
Connecticut	4,990	145	4,845
Dakota	149,100	1,400	147,700
Delaware	2,050	90	1,960
District of Columbia	70	10	60
Florida	58,680	4,440	54,240
Georgia	59,475	495	58,980
Idaho	84,800	510	84,290
Illinois	56,650	650	56,000
Indiana	36,350	440	35,910

States and Territories.	Gross Area.	Water Surface.	Land Surface.
Indian Territory	64,690	600	64,090
Iowa	56,025	550	55,475
Kansas	82,080	380	81,700
Kentucky	40,400	400	40,000
Louisiana	48,720	3,300	45,420
Maine	33,040	3,145	29,895
Maryland	12,210	2,350	9,860
Massachusetts	8,315	275	8,040
Michigan	58,915	1,485	57,430
Minnesota	83,365	4,160	79,205
Mississippi	46,810	470	46,340
Missouri	69,415	680	68,735
Montana	146,080	770	145,310
Nebraska	76,855	670	76,185
Nevada	110,700	960	109,740
New Hampshire	9,305	300	9,005
New Jersey	7,815	360	7,455
New Mexico	122,580	120	122,460
New York	49,170	1,550	47,620
North Carolina	52,250	3,670	48,580
Ohio	41,060	300	40,760
Oregon	96,030	1,470	94,560
Pennsylvania	45,215	230	44,985
Rhode Island	1,250	165	1,085
South Carolina	30,570	400	30,170
Tennessee	42,050	300	41,750
Texas	265,780	3,490	262,290
Utah	84,970	2,780	82,190
Vermont	9,565	430	9,135
Virginia	42,450	2,325	40,125
Washington Territory	69,180	2,300	66,880
West Virginia	24,780	135	24,645
Wisconsin	56,040	1,590	54,450
Wyoming	97,890	315	97,575
Unorganized Territory	5,740	...	5,740
Delaware Bay	620	620	.....
Raritan Bay and Lower New York Bay	100	100	.....
Total	3,025,600	55,600	2,970,000

The above table excludes Alaska, as the systematic survey of that region is still in progress, and annual reports show an increasing gross area.

The boundaries of the United States, both north and south, are partly natural and partly artificial.

Boundaries.

The line between Canada and the States in the northeast is artificial until it reaches the St. Lawrence system, when that becomes the line of demarcation between the two countries for a portion of its extent, and beyond the Lake of the Woods it again becomes an artificial line extending along the 49th parallel. It is about 3,700 miles long. The boundary between the United States and Mexico is partly marked by the Rio Grande and partly by an artificial irregular line extending in a southeasterly direction from the southernmost limit of California across to the Rio Grande at a point where it leaves the Territory of New Mexico. This line is about 2,100 miles long. The total ocean shore line, excluding islands, bays, and other irregularities, is about 5,270 miles long, making the total ocean shore and boundary lines about 11,070 miles long. If the bays, islands, etc., are included, the aggregate ocean shore and boundary lines will reach a length of about 25,000 miles.

Francis A. Walker, Superintendent of the Ninth Census of the United States (1870), in his official report, entered into an interesting discussion of what he termed the "line of population," in other words the demarcations of the settled area of the country. On the large map from which the engraved ones in the report were reduced he traced an unbroken line which started on Passamaquoddy Bay in Maine, ran around the continuously populated region, in and out as the facts of settlement required, and terminated on the Atlantic coast just above the Florida boundary. This line he found to be 3,200 miles long. Then, making an approximate estimate of the area between the coast and the line thus traced, he found that the settled area in 1790 was 226,085 square miles in extent, and that this entire body lay between 31° and 45° north latitude and between 67° and 83° west longitude.

Outside, however, of this body of continuous settlement, there were, in 1790, in addition to a score of small and remote posts and settlements, such as Detroit, Vincennes, Kaskaskia, Prairie du Chien, Mackinac, Green Bay, Sault St. Marie, etc., and in addition to the humble beginnings of Elmira and Binghamton in New York, which then lay outside the line traced on the map, three considerable masses of population, one in Western Virginia, one in Kentucky, and the third in Tennessee, which required to be taken into account in computing the settled area. That in Western Virginia lay upon the Ohio and Kanawha Rivers, and comprised about 750 square miles. That in Kentucky lay across the Licking, Kentucky, Salt and Green Rivers, and comprised about 10,900 square miles. That in Tennessee lay along the Cumberland River, and embraced about 1,200 square miles. If we add 1,000 square miles for all the other patches of settlement outside the "line of population," we shall have the settled area of 1790, 239,935 square miles, the aggregate population being 3,929,214, and the average density of settlement 16.4 inhabitants to the square mile.

By 1870 the "line of population" embraced 1,178,068 square miles, all between 27° 15′ and 47° 30′ north latitude and between 67° and 99° 45′ west longitude. From this, however, deduction should be made of 37,739 square miles on account of interior spaces vacant of population, and to what is left should be added 11,810 square miles on account of settled tracts east of the 100th meridian, and 120,100 on account of the great Pacific settlements, making the area settled in 1870, according to the rule of two or more inhabitants to the square mile, not less than 1,272,239 square miles, the aggregate population being 38,558,371, and the average density of settlement 30.2 to the square mile.

Table III. Development of the Frontier Line, 1790–1870.

Date.	Extent of Frontier. Linear Miles.		Extent of Continuous Settlement.	
	Returning to the Atlantic.	Resting on the Gulf of Mexico.	N. Lat.	W. Long.
1790	3200		31° —45°	67°—83°
1800	2800		30° 45′—45° 15′	67°—88°
1810	2900		29° 30′—45° 15′	67°—88° 30′
1820		4100	29° 30′—45° 30′	67°—93° 45′
1830		5300	29° 15′—46° 15′	67°—95°
1840		3300	29° —46° 30′	67°— 95° 30′
1850		4500	28° 30′—46° 30′	67°—99°
1860		5300	28° 30′—47° 30′	67°—99° 30′
1870		5700	27° 15′—47° 30′	67°—99° 45′

According to the census of 1880 the length of the frontier line was 3,337 miles. The area included between this line, the Atlantic and the Gulf coast, and the northern boundary, was 1,398,945 square miles, lying between 26° and 49° north latitude and between 67° and 102° west longitude. From this aggregate should be deducted, for unsettled areas, as follows: Maine, 12,000 square miles; New York, 2,200; Michigan, 10,200; Wisconsin, 10,200; Minnesota, 34,000; and Florida, 20,800—a total of 89,400 square miles, leaving 1,309,545 square miles. To this should be added the isolated areas of settlement in the Cordilleran region and the extent of settlement on the Pacific coast, which amount in the aggregate to 260,025 square miles, making a total settled area in 1880 of 1,569,570 square miles. The population was 50,155,783, and the average density of settlement 32 to the square mile.

In Part III, it is shown that the total acreage of all the farms in the United States, according to the census of 1880, was 536,081,835. Of this great area it is interesting to note here, as one of the economic divisions of the country, that 284,771,042 acres were classified as improved, and 251,310,793 acres as unimproved. Another economic division is found in

TABLE IV.—SETTLED AREA AND POPULATION, 1790–1870.

DATE.	AREA, IN SQUARE MILES.					POPULATION.	Average Density of Settlement. Persons to a Sq. Mile.
	Area Embraced Within the Frontier.	Vacant Tracts Within the Frontier.	SETTLED TRACTS WITHOUT FRONTIER.		Total Area of Settlement.

Another division of the settled area of the country, the arid, semi-arid, humid, and rice-growing States and Territories, wherein more or less extensive systems of irrigation are necessary for the growing demands of agriculture, will be considered further on, as will also the vast tracts which yield the country its enormous mineral wealth.

Coast line.

Having considered the area of the country, its boundaries, and various conditions within them, we now return to the coast for a view of its most marked features. The coast line of the United States may be said to be distinctively different on its two sides, although its contour on both is far more regular than that of western Europe. On the western coast there are very few indentations, no bays or gulfs existing worthy of the name between Puget Sound and San Francisco. At the latter point there is a commodious harbor, and further south, at San Diego, the sea encroaches on the land to form San Diego Bay. These, with Puget Sound and the estuary of the Columbia River, comprise all the navigable indentations on the Pacific coast. On the northeastern coast the case is different; the sea line becomes so broken that there are almost innumerable indentations and harbors. None of the bights have a great depth of water, but most of them are sufficiently large and sheltered to afford good anchorage to shipping—the type of this class of harbors being that of Portland. Including bays, islands, etc., the Pacific coast line is 3,251 miles long; excluding them it is 1,343 miles long. The Alaska lines are not here considered. The projection of Cape Cod, which stands out boldly at right angles to the mainland into the sea, forms a bay of considerable size, but the harbor of Boston, which lies at the lower end of the bay, while commodious, is not a specially good or accessible refuge for ships. The principal harbor in the United States (commercially) is that of New York, which city owes its preëminence to its advantages of situation, lying as it does at a point which is the natural terminus of the traffic of the great water highway afforded by the St. Lawrence River and its system of great lakes. It would, at first glance, seem that a more northern point—one nearer the mouth of the St. Lawrence—would fulfill these conditions better than New York, but owing to the fact that the river flows in a northeasterly direction, entering a region more or less sterile and unfertile, coupled with the fact that Long Island Sound afforded the best harbor thereabouts, trade naturally sought the outlet afforded by the city. In this connection it may be as well to notice Long Island, the only island of considerable size on the eastern coast of the United States. This body of land is about 120 miles long, and runs parallel to the mainland, from which it is separated by the Sound. Several smaller islands lie near it, and are believed at one time, in common with Long Island, to have formed a portion of the mainland, from which they were separated by a cataclysm. To the south of New York lies Delaware Bay, the expanded mouth of the river of the same name, the next indentation into the land being the Chesapeake Bay, into which the waters of several large rivers discharge—the Susquehanna, the Patapsco, the Potomac, the Rappahannock, the York, and the James. Philadelphia's situation gives it the advantage of the trade of the Delaware, while Baltimore commands most of that of the Chesapeake. Of late years, however, the heavy shipments of cotton and the coaling of steamers have been centered at Norfolk, Va., at the lower end of the Chesapeake Bay, instead of seeking its outlet at Baltimore, over 200 miles higher up. The next indentations to be considered are Albemarle and Pamlico sounds on the Carolina coast, both of which, together with Hatteras inlet, become dangerous, in certain seasons, to shipping, and are always more or less dreaded by mariners. Including bays, islands, etc., the North Atlantic coast line is 6,150 miles long, and the South Atlantic line 6,209 miles, a total of 12,359 miles. Excluding the bays, islands, etc., the total Atlantic coast line is 2,163 miles long. The Gulf of Mexico, the largest inlet into the American coast, is of great importance, both commercially and climatologically. The surrounding country is more or less miasmatic and unhealthy. Particularly is this true of the southern portion of Florida, which is at times almost uninhabitable. The Gulf coast line is 5,744 miles long, including bays, islands, etc., and 1,764 miles long excluding them. A glance at a map of North America will show that from Hudson Strait the coasts trend southeasterly to Cape Charles, Labrador, without presenting any remarkable indentation. From this point they run southwesterly, with numerous considerable gulfs and large indentations, such as the Gulf of St. Lawrence, the Bay of Fundy, Massachusetts, Delaware, and Chesapeake bays, and Pamlico Sound, to the southern point of Florida; whence winding around the Gulf of Mexico and passing the Peninsula of Yucatan, they border on the Caribbean Sea. Crossing the Isthmus of Panama the western coast, lying on the Pacific, takes a general northwesterly direction, forms the Gulf of California and Nootka Sound and terminates at Bering Strait, which separate Asia and North America at Alaska. Thus, the breadth of the entire North American continent diminishes southward to the Isthmus of Panama from 50° north latitude.

Although the coast line of the United States is comparatively limited when the size of the country is considered, this lack is fully compensated by the numerous navigable rivers, and the chain of great lakes on the northern frontier, with which communication is now open from the ocean, thus, as it were, extending the coast line for a distance of more than 3,000 miles.

The entire North American coast is indented with immense gulfs and arms of the sea, beginning in the

northeastern part of the continent with what has been called the "Sea of the Esquimaux," from its coasts being everywhere occupied by tribes belonging to this race. This water consists of two great divisions, Davis's Straits and Baffin Bay, separating Greenland from the mainland, and Hudson Bay, lying more to the south and west, but connected with the former by numerous channels. The next great inlet is the Gulf of St. Lawrence. Following the Atlantic coast south as it borders the United States we pass Passamaquoddy Bay, separating the State of Maine from the British province of New Brunswick, with the Bay of Fundy, separating Nova Scotia from New Brunswick, connected with it; Massachusetts Bay, between Cape Ann and Cape Cod; Long Island Sound, between Long Island and the coast of Connecticut; Delaware Bay, which, passing up between Cape May and Cape Henlopen, separates the States of New Jersey and Delaware; Chesapeake Bay, which communicates with the ocean between Cape Charles and Cape Henry, extending in a northern direction for 200 miles through the States of Virginia and Maryland; and Albemarle and Pamlico sounds on the coast of North Carolina. There are no really large bays or sounds on the United States coast of the Gulf of Mexico, Tampa Bay, Florida, being the most important indentation commercially. On the Pacific coast, north of the great Gulf of California, the most notable indentations are the Bay of San Francisco, the Straits of Juan de Fuca and Georgia, and numerous inlets on the coast of Alaska.

The islands of the United States are numerous, and lie both to the east and west of the mainland. Most of these give evidence that they were at one period portions of the mainland and have been reduced to their insular condition from various causes. Those north of Cape Cod are mostly of granitic formation and are raised to a considerable height above the sea-level. Of these, Mount Desert, off the coast of Maine, with an area of about 150 square miles, is the largest. To the south of this point, and particularly along the coast of the Southern States and in the Gulf of Mexico, the character of the islands changes, and they become low and sandy. These islands form an almost continuous chain for several hundred miles, enclosing practically land-locked sounds. The largest island on the coast, as has been said (*supra*), is Long Island, with an area of 1,450 square miles. Among the others are Nantucket and Martha's Vineyard, which lie east of Long Island, while in the far south we have the Tortugas and the Florida reefs. On the western coast the principal group which claims our attention are the Santa Barbaras, in which group are found several good harbors. The vast body of water embracing the Gulf of Mexico and the Caribbean Sea, which has been called the "American Mediterranean," is separated from the Atlantic by the peninsula of Florida and the islands of the West Indies. The latter are, as it were, a continuation of Florida, and are, it is probable, the only remaining points of what was once a broad belt of land, which has been broken to pieces and partially submerged in some of those tremendous convulsions to which the earth has been subject. But however this may be, this great inland sea is divided into two portions by the peninsula of Yucatan and Cape San Antonio, at the western extremity of the island of Cuba, which approach within a comparatively short distance of each other; that to the north being called the Gulf of Mexico, and that to the south the Caribbean Sea, or the Sea of the Antilles. There has been much speculation by geologists for many years on the probable existence of this enormous inland sea.

Islands.

Physical Features.

We now come to the consideration of the surface systems of the country. According to Professor J. D. Whitney the skeleton of the United States, or frame-work of mountains, to which its plains, valleys, and river system are subordinate, and on the direction and elevation of whose parts its climate is in a very large degree dependent, is represented by two great systems of mountain ranges, or combinations of ranges — one forming the eastern, the other the western, side of the frame-work by which the central portion of our continent is embraced. These two systems are the Appalachian and the Cordilleran, and are of very different magnitude and extent.

Appalachian System.— This, the oldest system geologically, is on the eastern border of our territory, and comprises the northeast and southwest trending masses of ranges.

A glance at the map shows that the central portion of North America, from the Gulf of Mexico to the Arctic Ocean, is a region of great rivers and lakes, and not of mountains. A sinking of the land of less than 1,000 feet would open a water-way through from north to south; 2,000 feet of such a sinking — or an equivalent rise of the ocean — would divide our territory into two distinct and remote portions. On the east we should have a comparatively narrow belt of land extenting in a northeast and southwest direction from Pennsylvania to Georgia, with groups of outlying islands on the north, especially in about latitude 44°, where the tops of the Green, White, and Adirondack Mountains would rise in the form of lofty and precipitous islands, above the waste of waters. On the west, the mass of land remaining uncovered would be of grand, almost continental dimensions, for its breadth would be fully equal to 1,500 miles, narrowing as we follow it northward, while in length, north and south, it would extend entirely across our territory. The breadth of the ocean separating these masses of land would be not far from 1,000 miles.

The Appalachian chain extends from the promontory of Gaspé, in a general southwesterly direction, for a distance of about 1,300 miles, into Alabama, where it dies out, and becomes lost under the horizontal strata of more recent geological formations which cover nearly the whole surface of that State. The base from which this chain rises, on the eastern side, is the Atlantic sea-board, which, in the early history of the United States, seemed to be the whole country, and which is still commercially the most important, and the seat of its largest cities. This plain is slightly inclined toward the Atlantic, and its elevation above the sea is inconsiderable. In New England it hardly exceeds 300 to 400 feet; but toward the south, after passing the Bay of New York, where it is nearly at the sea-level, it gains in altitude and also in width, finally attaining a height of 1,000 feet and a breadth of some 200 miles. The western base of the Appalachian range is the great plateau region, which descends gradually toward the great lakes and the tributaries of the Ohio, having a general elevation of 1,000 feet or more, but deeply cut into by the streams which traverse it, and which run in valleys depressed from 300 to 500 feet below the general level of the country.

The Appalachian chain presents, in many of its features, a most marked contrast to the Cordilleran. In many respects the relations of the two systems of elevations are like those borne by the Alps and the Jura. The Cordilleran, however, are vastly grander in dimensions and more complicated and less a unit than the Alps; while, on the other hand, the Appalachians and the Jura have several striking points of resemblance. Of these the most characteristic is the presence in both chains of numerous nearly parallel lines of elevation — wrinkles of the surface or folds of the strata, as they may be called — which preserve their regularity of form, parallelism, and equality of height over long distances, so that they seem almost like artificial wa ls, in this respect differing most wonderfully in character from the ranges of the Cordilleran, which seem to delight in irregularity of outline and in lack of persistency of form. It is especially in the middle portion of the Appalachian chain that these peculiar characters are well developed. Toward the north, and again at the oppo-

site extremity, in the southern region, the parallelism of the subordinate members is almost lost, the structure of the range becoming more irregular and complicated. According to Professor Guyot, there is one feature which distinguishes the Appalachian system from that of the Jura: this is, the well-marked division of the former into two longitudinal zones of elevation, one turned toward the shores of the Atlantic, in which the form of parallel chains just spoken of predominates, and the other toward the interior, and made up of elevated and continuous plateaus descending from the summit of their eastern escarpment, in the center of the system, in gentle stages toward the basins of the lakes and the valley of the Ohio. Thus, in reality, there are two somewhat distinct regions traversed in crossing the chain through its central portion, from east to west; one a zone of parallel ranges and longitudinal valleys, the other a region of plateaus with occasional irregular and quite subordinate chains wrinkling their surface. Thus, therefore, there is lacking in the Appalachians that almost entire uniformity of structure which prevails in the Jura.

Professor Guyot calls attention to a conspicuous feature of the most folded portion of the Appalachians, characterizing the chain through its entire length. This is, the existence of a great central valley running through the system from northeast to southwest, which can be traced without difficulty, although not perfectly uniform in its development. It is the Lake Champlain and Hudson River Valley in New York, the Kittatinny Valley of Pennsylvania, the Great Valley of Virginia, and, finally, still further south, the Valley of East Tennessee. The chain, or system of chains, bordering this central depression on the southeast, is also a persistent feature of the Appalachian system, for it extends with but few interruptions from Vermont to Alabama, being known by a variety of names, as it passes from one State into another. It is the Green Mountain range of Vermont, the Highlands of New York, the South Mountains of Pennsylvania, the Blue Ridge of Virginia, and, finally, the Iron, Smoky, and Unaka Mountains of North Carolina and Tennessee.

Possessing these features in common, as a whole, the chain of the Appalachians presents three subdivisions, each exhibiting its own well-marked peculiarity of structure. These are the northern, extending from Gaspé to the Hudson; the middle, from New York to the Kanawha or New River in Virginia; the southern, from New River to the southwestern extremity of the system. Each of these subdivisions has its peculiar curvature and general direction. The northern trends to the north from the Hudson River to near the Canada line, then bends to the eastward, sweeping a great curve, so as to present, on the whole, its concavity to the southeast; the middle subdivision also curves quite regularly, the ridges trending from east and west around to southwest, so that the concavity faces the Atlantic shore, while the most southern portion of the range, from New River southward, bends to the west again, so as to form a gentle curve concave toward the northwest.

Subdivisions.

Northern Division.— The most northern division of the three is quite distinct from the next one south, both geographically and geologically. It includes all the mountain groups and ranges north and east of the Mohawk and Hudson valleys, which make a complete break through the system, both vertically and longitudinally, forming the great natural highway between the East and the West, or the Great Lakes and the Atlantic sea-board. This was the first route across the country which was traversed by canal and railroad. So complete is the physical break here, that a rise of the ocean of 400 feet only would separate all the extensive region included between the St. Lawrence, the Atlantic Ocean, and the Hudson and Mohawk valleys, into a great island entirely detached from the rest of the continent. A rise of 140 feet only would detach all that country which lies east of the Hudson and Lake Champlain.

The subdivisions of this eastern group of the Appalachians are necessarily rather artificial, for the mass of elevations is very irregular in its development. The most continuous range is that of the Green Mountains; but this is flanked on each side by higher groups: on the east, the White Mountains; on the west, the Adirondacks. Of the first-named group, Mount Washington is the culminating point, and it is 6,288 feet high; of the last-mentioned, Tahawus, with an altitude of 5,379 feet, is the dominating peak. Greylock, in Massachusetts (3,505 feet), and Mount Mansfield in Vermont (4,430 feet), are the highest points in those States.

The line of summits extending through Massachusetts and New Hampshire, beginning with Wachusett on the south, and extending up to the White Mountains, through Monadnock, Sunapee, Kearsarge, and other peaks, is broken and irregular. Both the White Mountains and the Adirondacks are rather isolated masses, while the Green Mountains proper are in more intimate connection with the Canadian range which terminates in Gaspé.

Central Division.— The central division of the Appalachian chain extends from the Hudson River to the Kanawha, which makes an almost complete cut across the chain, heading in the Blue Ridge, and marking an important change in the character of the topography. This central division of the Appalachians is about 450 miles in length. It is very narrow toward its northern end, but widens out in Pennsylvania, decreasing again in Virginia. It is composed of a considerable number of subordinate chains, much curved toward the west, and remarkable for their regularity, their parallelism, their abrupt declivities, and their moderate elevation, both relative and absolute; they rarely rise to 2,500 feet above the sea-level.

West of this division of the Appalachian chain is the great plateau, which occupies all that part of New York which lies south of the Mohawk, and also the northwestern part of Pennsylvania, and reaches an elevation near Lake Erie of 2,000 feet. From this table-land the drainage descends by the Great Lakes to the St. Lawrence, to the Gulf of Mexico by the Ohio, and to the Atlantic by the Susquehanna, which breaks across the whole chain, finding its way in the most unexpected manner through gaps in the different ranges.

The Great Lakes, those vast expansions of the upper waters of the St. Lawrence, are among the grandest of the geographical features of the North American continent. They are remarkable for their immense area and uniformity of elevation above the sea-level, and the consequent facilities which they afford for commercial intercourse among the States which are near them. Their combined area is equal to a little more than 90,000 square miles, Lake Superior having over 30,000, and Michigan and Huron each over 20,000 square miles of surface. Erie, Huron, and Michigan are nearly on the same level, the extreme difference between the first and last named being only about 19 feet, while Superior is only 22 feet higher than Michigan or 41 above Erie. The divide between the Great Lakes and the waters flowing into the Mississippi and its tributaries is also everywhere low, and at the lower end of Lake Michigan it is so trifling that only a small amount of excavation has been required to cause the waters which formerly flowed into that lake to run toward the Gulf of Mexico. Lake Ontario is, indeed, 331 feet lower than Lake Erie, about half the descent from one to the other being made in one single plunge of the vast body of water, forming a cataract which has, in all probability, not more than one rival in the world.

Great Lakes.

The topography of the Appalachians in Pennsylvania has been carefully worked out by the State Geological Survey, and it is so remarkable in its character that some additional details may with propriety be given in regard to that portion of the chain.

According to Professor H. D. Rogers, the mountain-zone of Pennsylvania may be divided into five well-marked parallel belts, which are as follows, when

enumerated in order from east toward the west: 1st. The South Mountains, already mentioned as being the continuation of the Highlands of New York, and the equivalent of the Blue Ridge of Virginia; 2d. The Great Appalachian Valley; 3d. The Central Appalachian Ridges, or the Appalachian chain proper; 4th. The Sub-Alleghany Valley; 5th. The Alleghany Mountains, or the southeast escarpment of the Alleghany Plateau.

The South Mountains have already been alluded to as part of the system of ranges bordering the great central depression of the Appalachians on the east. In Pennsylvania this belt consists of two quite detached ranges of hills, one of which is the prolongation of the New York Highlands, the other the northeastern termination of the Blue Ridge: both these groups of hills have a moderate elevation in Pennsylvania, hardly exceeding 600 or 700 feet.

The Appalachian Valley, or Kittatinny Valley, as it is usually called, stretches across the State from the Delaware to Maryland, forming a part of the great central valley previously mentioned. In Pennsylvania this has an elevation of from 200 to 600 feet, and it forms a broad, moderately undulating plain, having a width of from ten to eighteen miles. This valley is, beyond a doubt, one of the most favored parts of our country; climate, soil, mineral resources, and scenery all combine to lend it charms.

Pennsylvania.

The third division, or the Appalachian chain proper, may be thus described, using nearly the language of Professor H. D. Rogers: — It is a complex chain of long, narrow, very level mountain ridges, separated by long, narrow, parallel valleys. These ridges sometimes end abruptly in swelling knobs, and sometimes taper off in long, slender points. Their slopes are singularly uniform, being in many cases unvaried by ravines or gully for many miles; in other instances they are trenched at equal intervals with great regularity. Their crests are, for the most part, sharp, and they preserve an extraordinarily equable elevation, being only here and there interrupted by notches or gaps, which sometimes descend to the water-level, so as to give passage to the rivers. The whole range is the combined result of an elevation of the strata in long, slender, parallel ridges, wave-like in form, and of excessive erosion of them by water; and the present configuration of the surface is one which demonstrates that a remarkable, and as yet little understood, series of geological events has been concerned in its formation. The ridges, which are but remnants of the eroded strata, are variously arranged in groups with long, narrow crests, some of which preserve remarkable straightness for great distances, while others bend with a prolonged and regular sweep. In many instances, two narrow, contiguous, parallel mountain crests unite at their extremities, and enclose a deep, narrow, oval valley, which with its sharp mountain sides bears not unfrequently a marked resemblance to a long, slender, sharp-pointed canoe. There are two classes of these boat-shaped valleys, one possessing a synclinal structure, or having geologically higher strata in the middle of the trough, the lower, harder rocks forming the steep, narrow, enclosing mountains; the other having the anticlinal form, being valleys scooped longitudinally out of the summits of the arches by an excessively energetic erosive force of water cutting through the harder upper strata, down into the softer, lower ones. Both classes, though thus begirt by steep, sharp, and very strong ridges, are usually entered by more than one notch or gap, affording passways to the streams. These gorges constitute a most important feature in the hydrography of the country, as they permit a ready transit, at the general level of the country, through and among crowded and steep mountain ridges, which, when these are absent, are found to be difficult of passage even for common roads. It is through these gaps that the rivers of Pennsylvania find their way to the sea, almost the entire drainage of that State being across the whole breadth of the chain. Interspersed among the narrow ridges and valleys are wide tracts of table-land, of the same general elevation as the ridges themselves. Some of these are formed by the merging together of two or more ridges, which flatten out before uniting; others are broad synclinal plateaus, or high flattened mountain basins, subdivided at their ends into a series of spurs projecting like fingers.

The other two divisions of the Pennsylvania mountain-zone, namely the Sub-Alleghany Valley and the Alleghany Mountains, are of subordinate importance and need not here be dwelt on further. The latter is indeed only the escarpment of the great plateau which, properly, forms the western base of the Appalachian system.

Southern Division.—Greater diversity of structure and increased altitude mark the southern division of the Appalachians, or that part of the chain which extends from New River toward the southwest. Here, however, we have no such careful studies of the topography as have been made in Pennsylvania, and for our knowledge of the relations of the different groups of ranges we have to depend chiefly on the investigations of Professor Guyot. As before remarked, the main chain which borders the Great Valley on the east, and which separates it from the Atlantic sea-board, bears off more to the southwest, leaving a considerably wider space between it and the ocean, and in this southern extension it assumes the name of the Blue Ridge. This eastern chain now becomes the divide between the waters flowing into the Atlantic and those which run to the Mississippi, the New or Kanawha River having its source on the extreme eastern border of the mountains, crossing all the ridges in a northwesterly direction, or just the opposite of what we have previously noticed as occurring in the case of the Susquehanna. There are marked peculiarities of structure which accompany this complete reversal of the lines of direction of the drainage of the chain. That remarkable looped structure of the ranges which we have observed as occurring in Pennsylvania gradually disappears as we go southward, and instead of it we have straight outcrops cut off by oblique faults, and a general broadening and increased elevation of the mountain masses. In the high regions comprised between the Blue Ridge and the great chain of the Iron, Smoky, and Unaka Mountains, separating North Carolina from Tennessee, we have the culminating portion of the whole chain of the Appalachians. Here, for an extent of more than 150 miles, the mean elevation of the valley from which the mountains rise is more than 2,000 feet, scores of summits reaching 6,000 feet, while the loftiest peaks rise to a height of 6,700 feet. To the west of this high region is the valley of the Tennessee, the continuation of the Great Central Valley previously noticed as a marked feature of the whole chain. This valley rises as we go south, and attains its greatest elevation in the basin of the New River, where it reaches a height of 2,600 feet. Along the Tennessee it widens out to nearly 601 miles, and has here a mean height of not more than about 1,000 feet, which is only one-half of that of valleys in the high mountain region to the east, in North Carolina.

Beyond this, still farther to the west, is the plateau of Tennessee, known as the Cumberland Mountains, which are indeed but the escarped edges of a table-land some thirty or forty miles wide, which stretches along between the Cumberland and Tennessee Rivers.

Between the Appalachians and the Rocky Mountains there are, within our borders, no connected masses of mountain ranges; isolated hill ranges rise, like islands, at various points, as in Missouri and Arkansas; and there are a few short ranges on the south shore of Lake Superior.

North of the Great Lakes and the St. Lawrence, however, there is the dividing range which separates the waters flowing into the last-named stream from those which run into Hudson Bay. This is an imperfectly known region, wonderfully cut up by rivers and dotted with lakes. The highest points of the Laurentian range, as these mountains are called, is supposed to be where the Saguenay cuts the chain,

and 4,000 feet is given as the approximate elevation, while peaks in the parallel ridges nearer the St. Lawrence exceed half that height. Among the summits seen with such picturesque effect from Quebec, Mt. St. Anne is the highest, and is given by Bayfield at 2,687 feet.

This range falls off in elevation as we follow it west, and in the country between the Ottawa and Lake Huron the highest summits do not appear to exceed 1,500 to 1,700 feet. The range is made up of rounded hills, densely wooded, almost exclusively with coniferous trees on its higher portions. Its valleys are very wide and full of great ponds and lakes, so that one may traverse almost the whole region with the aid of the birch canoe. As Sir William Logan remarked in 1863, over a thousand lakes have already been laid down on the maps of the Canadian portion of the Laurentian Mountains, although the region has been as yet only imperfectly explored.

Mississippi Valley.— According to the United States census the whole country is drained as follows: "Atlantic and Gulf, 2,178,210 square miles; Great Basin, 228,150; Pacific slope, 619,240. The drainage into the Atlantic and Gulf is distributed as follows: New England coast, 61,830 square miles; Middle Atlantic coast, 83,020; South Atlantic coast, 132,040; Great Lakes, 175,340; Gulf of Mexico, 1,725,980 (the Mississippi-Missouri basin being estimated at 1,240,039)."

From this statement it can be seen that the drainage system of the Mississippi far exceeds that of any other system within the limits of the United States, or of North America. The reason is obvious, when we consider the conformation of the surface of the country. We quote the words of an eminent authority in the following paragraphs, in order that the reader may comprehend the conditions attendant on the system of the Mississippi:

"The all-important fact in the topography of the North American continent in general, and of the United States in particular, is the existence of a central comparatively low and level region, declining gently from a watershed in close proximity to the Great Lakes on the north, toward the Gulf of Mexico on the south.

"One may ascend the Mississippi to its junction with the Ohio, at Cairo — a distance of 1,100 miles from the Gulf of Mexico — and the elevation attained will be only about 300 feet, an average ascent of about four inches to the mile. A journey of almost 1,000 miles farther to Pittsburg, at the junction of the Allegheny and Monongahela Rivers, will only give a total rise of 700 feet above the sea-level. The head of the Mississippi is in a region entirely destitute of mountains, comprising an almost level area, covered in large part by lakes and swamps, and only about 1,500 feet in elevation. In ascending the Mississippi to St. Louis, a distance of 1,250 miles, we have reached an elevation of about 400 feet, and at St. Paul, 658 miles above the mouth of the Missouri, one of a little less than 700 feet. If we follow up the Missouri to the western line of the State of the same name, where the river flows from the north, we have the choice, if we wish to keep on directly west, of following either of its great branches from that direction — the Platte and the Kansas. Up either of these we may travel for fully 500 miles, rising so gradually that the difference of elevation from day to day is hardly perceptible, the country preserving all the characteristics of a plain, although declining gently to the east."

This valley may be regarded as extending from the great plains of the Cordilleran system to the Appalachians on the east. Its extent may be roughly set down as 300,000 square miles. Of this area a very large proportion is fertile, and while timber is not a prominent feature of the major part of the territory, the soil is capable of sustaining all kinds of vegetation, and it is among the vast prairies of this region that we find the greatest averages of productiveness in the Union. The rivers, which either flow toward the Gulf or to a confluence with the main central trunk, have worn for themselves in the soil deep depressions or troughs, in some cases contracting their width and leaving the "bluffs" several miles away from the present margins of the streams, and in others having them still close to the edges of the running waters. These "bluffs" are characteristic of the Missouri and Mississippi, in the cases of which rivers they stand close to the water's edge and appear as abrupt precipices. The following figures may be given as indicative of the general slope of the valley: At St. Paul the height of the land above the Gulf of Mexico is 870 feet; Fort Snelling, 828 feet; Davenport, Iowa, 485 feet; St. Louis, 400 feet; Columbus, Ky., 375 feet; Memphis, Tenn., 246 feet; confluence of Arkansas River, 162 feet; Natchez, Miss., 66 feet; Baton Rouge, 34 feet; New Orleans, 28 feet. This rise in height above the level of the Gulf is, as far as absolute level is concerned — *i. e.*, if a straight line were drawn from the head of the Mississippi — counteracted by the curvature of the earth in the long distance over which the stream flows, so that the river really runs up hill. Thus, it must be understood that, when we speak of the levels of the two points, we mean that a line drawn from the surface of the earth (for instance) at St. Paul to the center thereof, would be 870 feet longer than a line drawn from the surface to the center at the mouth of the river.

Cordilleran System.— The Cordilleras are a part of the great system or chain of mountains which borders the Pacific coast of both divisions of the American continent, and forms its dominating and most imposing feature. In South America, however, the chain — there called the Andes — is comparatively narrow, but, on the other hand, exceedingly elevated; it is also remarkable in the way in which it hugs the coast, forming a lofty wall, as it were, on the Pacific edge of the continent, and being thus the cause that there are neither harbors nor navigable rivers on that side; and, besides, giving rise to extraordinary peculiarities of climate at its western base. The chain is also remarkable for the grandeur of its volcanic manifestations; its highest points being sublime volcanoes — which, however, are gradually losing their power, and approaching the dormant, or even the extinct, condition.

The Andes sink at the Isthmus, and almost disappear, so that a railroad of little less than 48 miles in length, and having an elevation of only 262.4 feet at its summit, there unites the two oceans. From the Isthmus north, the ranges gain rapidly in elevation, and through Central America and Mexico become more and more complex in character, while the volcanic cones which are sentineled along their crests again increase in altitude, and in the activity of their manifestations. Two of these cones — Popocatepetl and Orizaba — are the culminating points of North America, being the only summits which surpass 17,000 feet in altitude.

From Mexico the system of the Cordilleras enters our territory, still widening and gaining in complexity. Just above the southern border of Arizona, along the parallel of 32°, occurs the greatest depression of the Cordilleras existing anywhere north of southern Mexico; here the continent may be traversed without rising to an elevation of over 4,000 feet. The country along this line is a table-land, with many short and broken ranges of no great altitude built upon it, but deeply excavated by numerous cañons, as the narrow valleys of the streams are, in the Cordilleras, universally called, and of which that of the Colorado River may be taken as the type. On this plateau, in latitude 35°, there is a transverse east and west line of volcanoes, similar to that which traverses Mexico; these grand volcanic cones, of which San Francisco Mountain is the loftiest and best known, rise to nearly double the altitude of the plateau on which they are built up.

The greatest width of the Cordilleras is along the line passing from the vicinity of San Francisco, by Great Salt Lake, to Fort Laramie, or between latitudes 38° and 42°; here the mass of mountains attains

a breadth of fully a thousand miles, and if the Black Hills, an outlier of the Rocky Mountains, in latitude 44°, are included — as they may properly be — the total breadth of the complex of ranges will be, in its maximum, over 1,100 miles. The whole area embraced within the mountainous belt which we call the Cordilleras is but very little, if any, short of a million of square miles; hence it may, with propriety, be called the greatest physical feature of our territory.

To roughly indicate the shape of the mass of the Cordilleras, we may consider it as having a lozenge-shaped figure, bounded by two parallel north and south and two northwest and southeast sides. The length of each side is approximately 600 miles. The western edge of the figure corresponds in trend to the line of the Pacific coast, which, as a glance at the map will show, is northwest and southeast as far as Cape Mendocino, and from there to Vancouver Island north and south nearly. The north and south trending portion of the Pacific edge of the Cordilleras is known as the Cascade range; the northwest and southeast range, as the Sierra Nevada. Here, bordering on the Cascade and Sierra Nevada ranges, but still nearer the ocean, are the Coast ranges, parallel with the loftier masses on the east, and inosculating with them, at various points, in such a manner that a distinct separation between coast and interior ranges seems hardly possible, either on geographical or geological grounds.

Divisions.— The Cordilleran system may be properly divided into the Rocky Mountain region, the region of the Great Basin, and the Basin ranges, the Columbian plateau, sometimes described as the Northern plateau, the Southern plateau, and the Cascade, Nevada, and Pacific coast ranges. These divisions constitute the six regions included and treated under the above designated system. The first named is divided into sections and ranges, and forms the eastern boundary line of the system. These are subdivided into ranges or sections extending north and south, and they in turn into northeastern and northwestern extensions. Between these a range of elevation extends to a considerable distance, at a height of from one to several thousand feet, across the summit of which the route of the Pacific railway system was long since completed and improved. To the north of this are to be found mountain ranges, conspicuous for the wealth of their mineral deposits, also as the source of the Colorado, Missouri, and Columbia rivers. The division extending in a northerly and southerly direction approximates 700 miles in length by about 300 miles in breadth, rising from the foot-hills to the mountain heights by abrupt ascents. In the State of Colorado, the most celebrated and attractive system of elevated plateaus is embraced in Grand and Park counties between 36° and 41°. They consist of North, South, Middle, and San Luis parks, situated at an elevation of from six to ten thousand feet and drained by the Rio Grande, Colorado, Platte and Arkansas rivers. The Middle Park is also drained by streams flowing into Grand River and is cut up by elevations. South Park is from thirty to forty miles in length and twenty miles wide, and North Park which is more level than either of the preceding, is forty miles by twenty, and inclosed in lofty ranges, at some places 12,000 feet high.

The Colorado and Park ranges of Colorado are situated on the opposite sides of the Rio Grande. The former extends from 40° N. latitude to Pike's Peak, and contains the latter mountain, besides Gray's Peak, 14,341 feet in height, also Long's Peak, 14,271 feet. To the west of the source of the Arkansas lies the Saguache range, among the loftiest of the Rocky Mountains, averaging 14,000 feet, the highest points being Harvard Mountain, 14,375 feet, and the Holy Cross, 14,176 feet. This range is followed by the Continental Divide to 38° 20′, whence it pursues a southwesterly direction for a distance of nearly one hundred miles, thence following the San Juan range. The latter is the western border of San Luis Park, and is characterized by a "broken country," culminating at Uncompahgre Peak, 14,235 feet high.

The Elk Mountain range lies west of the Saguache. It consists of pinnacles of volcanic matter, the highest of which is Castle Peak, 14,000 feet. In this range rise the streams which unite and form the Gunnison River.

The Park range above referred to is bounded on the northeast by the range of Sangre de Cristo, containing the highest point in the Rockies — Blanca Peak, 14,463 feet. The latter range is described as a continuation of the Saguache range and possesses similar geological features. The Garita hills are at the northwestern side of the San Luis valley. They are bounded by the Uncompahgre and San Juan ranges on the northwest and southwest respectively, and are irregular and broken. The Uintah range is to the west of North Park. It unites with the eastern side of the Wahsatch range, runs upward of one hundred miles in an easterly direction when it is absorbed by the Cretaceous and Tertiary masses west of the Park range. South of it is the Uintah valley, the extreme western boundary of the plateau sections of Colorado and drained by the streams which combine to form the Green and Grand rivers. The highest peaks of the Uintah are Gilberts, Wilsons, and Takewanna, severally 13,687, 13,235, and 13,458 feet.

The Wahsatch range forms the western boundary of the Rocky Mountain division of the Cordilleran system. It is among the most prominent of the ranges of that division, and at one point east of Salt Lake City attains a height of more than 12,000 feet, its altitude diminishing, however, to the north, and becoming less and less perceptible as a range west of Bear River, a stream originating in Uintah range, thence flowing first in a northerly direction, then in a southerly direction, until it finally empties into Salt Lake. North Logan is one of the lofty peaks of the range.

Northern Division.— The division of the Rocky Mountains known as the "Northern Division" is made up of a number of ranges extending generally from the northwest to the southeast, and, excepting the Wind River range, not characterized by any remarkable peaks. This division has not been as fully explored as the southern division of the Rocky Mountains. The latter in Montana and Idaho is less regularly developed than in the south, but parks are nearly as numerous, and the water courses are thickly lined with sycamores and other forest trees. The soil of the parks is in some cases cultivable, and affords abundant pasturage. The Bitter Root Mountains occur between the Missouri and Columbia Rivers, to the west of which, also to the northwest, are the Cœur de Alene and Lapwai ranges, by which the Rocky and Blue Mountains are connected, while to the east of the main range of the former, collections of mountain elevations are to be found. The range of Crazy Mountains, formed of sandstone, shales, volcanic rocks, etc., is north of Yellowstone River, while to the northeast, in 109°–110° W. longitude, are to be seen the Judith Mountains; in the southeast are the Big-Horn, and east of these the Black Hills. The latter extend over a distance 120 miles long, and are from 30 to 50 miles wide; the highest peak, Mount Harney, has an elevation somewhat less than 10,000 feet. Geologically they are not dissimilar from the ranges in the northern division of the Rocky Mountains. The central deposits consist of "crystalline rocks." Potsdam stone supports "beds of Carboniferous age"; these are succeeded by a sandy stratum, sandstone, limestone, etc., gradually increasing in thickness toward the north, and attaining the greatest depth in the valley of Belle Fourché. The Jurassic is extensively developed in the Wind River range and vicinity, becoming thicker farther south, in the neighborhood of the Great Basin. The Cretaceous series is also extensively developed in the Wind River range, and are similar in some of their features to the Jurassic and Triassic. The topography of this region is described as "interesting," owing to the position of the groups of strata mentioned, a special and conspicuous incident of the same being the "Devil's Tower," upward of 600 feet in height.

Great Basin.—A widely extended plateau, containing ranges of mountains running north and south, is characteristic of the "Great Basin." The latter is a roughly formed area of territory embracing nearly 250,000 acres of land, continuing from the northeastern part of California to the Uintah range. It is in the shape of a triangle with its base running east and west and its apex at the mouth of the Colorado River, drained in part by the affluents of Snake River, with summits of the Sierra Nevada occurring at intervals for a considerable distance in a southwesterly direction. Humboldt River has its origin 100 miles west of Salt Lake, and indicates a depression at the northern boundary of the Basin, increasing its elevation as it runs south to a height of from 4,000 to 8,000 feet. The Basin at the north is drained by Humboldt sink, and the valleys of the Basin also form drainage channels. Vegetation does not thrive in the lower valleys, only sage grass growing in the more favored localities. The ranges extend north and south, many are conspicuous for some distance, while others are insignificant, the Humboldt being the most prominent. It begins in the Basin's center and traverses in a northerly-northeasterly direction to the source of the Humboldt River, attaining its greatest elevation at Mount Bonpland, 11,321 feet. West of Humboldt River about 160 miles the Pah Ute range occurs, and at the western boundary of the Basin is Star Peak, the highest peak of the West Humboldt range. In none of the ranges does vegetation prosper, unless an exception is made in favor of the highest portions, in some of the cañons, where forest trees are abundant. Geologically, however, the Basin contains much of interest. The Alpine Trias is the most conspicuous formation, there seeming to be an exceptional lack of the Cretaceous, Tertiary, and other strata peculiar to the Rocky Mountain divisions. The formations are similar, in some particulars, to those of the Appalachian and Jura ranges. The ranges are monoclinal, anticlinal, or synclinal, and sometimes two or more of these are combined. There is an absence also of the features of Appalachian erosion, but the Basin ranges differ from the Appalachian and the Jura in the appearance of volcanic masses, in which respect the ranges of the Basin are not dissimilar from other portions of the Cordilleran system.

Columbia Plateau.—The area of territory in which is included the Columbia plateau is not entirely familiar to the public. It is bounded on the east by the Rocky Mountains, on the west by the Cascade range and is drained by the Columbia and Snake Rivers and their branches. The Cordilleran system is reduced in width in proportion as the north division of the Rocky Mountains advances in a northwesterly direction, and the area between the Cordilleran and Rocky Mountain systems is occupied with ranges but indifferently known, if the Blue River and Salmon River ranges are excepted. The Salmon River range runs from the western limits of the Rocky Mountains to the Snake River, the Blue River range occupying the angle caused by the Snake River, in its flow in a northerly direction to Columbia River. After the Columbia is joined by the Okanaga River, some sixty-five or seventy miles south of the boundary line of the United States, its course is parallel with the Cascade range to Great Bend, whence it proceeds in a westerly direction through that range to the Pacific. The country between the range and the river is mountainous, and that between the river and Clarke's Fork, specially so, the range rising from five to seven thousand feet. Volcanic deposits characterize the area of territory on the confines of the Great Basin between the Rocky Mountains and the Cascade range to the south of Columbia River. The formation extends in northerly and southerly directions into the Northwestern Territory, Nevada, up Snake River, and southwest into California. It is also to be found in Montana, and, as it proceeds farther north, indicates the presence of "eruptive accumulations" which culminate in Mount Rainier. The beds of this material vary in dimensions and thickness, and are deposited promiscuously. They are frequently found to have been cut into by streams, and as frequently form the crest of an elevation over which falls of water are precipitated, presenting a picture at once picturesque and attractive. Among these are the Shoshone Falls. Other characteristics of these plateaus are collections of cones at intervals, though the greater proportion of the volcanic overflows is widely distributed in the form of lava, the volcanic rocks also covering an area of many thousand miles in the neighborhood of the Columbia River and the Cascade range. There are indications that a large moiety of this area was at one time covered with water. Indeed, bodies of water are to be seen there at present, singly and in groups, many of them of large size, especially in portions of Oregon and California. The valleys contain small tracts of land susceptible of cultivation, but, as a rule, the soil of the plateaus is sterile. Geologically, the mountain ranges upon which volcanic masses have fallen are not unlike the rocks of the Sierra Nevada. Granite occurs in the Owyhee Mountains, supporting an extended range of sandstone, slate, etc., with frequent veins of gold and silver occurring in quartz deposits. The general indications at present point to a period at which volcanic eruptions seem to have been, not only frequent, but exceptionally active in many portions of the Sierra Nevada and Cascade ranges, and extending throughout a great expanse of territory in an easterly direction. This is supposed to have prevailed during the Post-Tertiary times, at least such is the conclusion of scientists, who further insist that the eruptions of fluid lava were infrequent, if occurring at all.

Bad Lands.—As already related, there were in former times numerous table-lands in the regions bounded by the Rocky Mountains on the east, and the Sierra Nevada on the west, that contained numerous bodies of water of very large dimensions. The water in these lakes has since disappeared, either through drainage, absorption, evaporation, or otherwise, and the formations at the bottom of each, effected by erosive agencies at frequent localities, now exhibit their geological structures, which have become objects of special study and interest to scholars and scientists. They have also produced a description of scenery known under the name of "Mauvaises Terres," or Bad Lands. These occur in the country south and southwest of the Missouri River and along its affluents, and are described as the most wonderful formations to be seen in North America, from a geological standpoint, but from an agricultural point of view are of no value whatever. They are represented as large bodies of strata or layers of rocky material hundreds of feet thick, extending over a vast region of country, and possessing attractions of an unique and interesting character. The action of the water, or of unknown causes, has combined to cut into or separate these masses, thereby creating cañons, gorges, and other developments of a striking and suggestive character. The walls of many of these, notably the Grand Cañon of the Colorado, the Black Cañon of the Gunnison, Weber Cañon, Echo Cañon, etc., rise perpendicularly to a height of from one to several thousand feet, and are worn and sculptured into forms wonderfully realistic. These features of interest are rendered additionally attractive by the coloring with which the strata are tinted, presenting almost every shade, and completing a combination of hues of never-ending fascination to the student, the admirer of artistic development, and the traveler, as also a field for the study of the glacial period unsurpassed on the continent. These phenomena, if they may be so described, are part of the country to the south and east of the Great Basin, between the Colorado River and Great Salt Lake, and extend westwardly to the eastern boundary line of California, where they disappear. The dimensions of the area embracing the most conspicuous development are varied. The region in which the Grand Cañon is situated is 180 miles long by 125 miles wide. A ram-

part, so to speak, indicates the western boundary line similar to that exhibited by the Sierra Nevada and the ranges in southern California, where the transition is said to be exceptionally abrupt. Four plateaus to the north of the Grand Cañon are drained by the latter, while a fifth is drained by the Marble Cañon. The former, namely, the Kanab, Uinkara, Kaibab and Sheavwits, are of Carboniferous strata, while the Paria, or fifth plateau, is at a lower level and covered with Triassic rocks.

A rampart also describes the southern boundary of the Grand Cañon district: — Indeed it is said that the western boundary line is a continuation of that on the south, and preserves the same general features for a distance of forty or fifty miles, thence changing its course to the southeast, traversing eastern Arizona to what is known as the Mogollon Mountains, whence it proceeds southwest, where the country descends from the horizontal platform into a lower country with geological formations similar to those which characterize the western country of the Sierras. On the western extension of the Sheavwits plateau and north of the Colorado, is an extensive valley known as the "Great Wash." Adjoining the Sheavwits, yet separated from it geologically by Hurricane Ledge, is the Uinkaret plateau. The rampart of the former plateau is a break along which the region to the east has been raised several thousand feet, while Hurricane Ledge marks a rise of from 1,500 to 2,000 feet in the land to the east of the latter. The Kanab is the broadest and the Kaibab the loftiest of these plateaus, being from eight to ten thousand feet in height, covered with parks and forests, which grow luxuriantly. It has a total length of ninety miles and an average width of thirty miles. The Paria plateau is in an easterly direction, and beyond it lies the Kaiparowitz. At the north are a series of plateaus, separated from each other, the physical conformation of the country being the product of simple attrition, together with numerous instances of seismic phenomena. Another area of plateau land is on the southern side of Colorado River, with an underlying stratum nearly horizontal, but unmarked by any of the features mentioned as occurring in the regions to the north, though they are located at a greater elevation than the latter. At a distance of about thirty miles, in a southerly direction from the Kaibab plateau, is what is known as "Red Butte," and sixty miles south of Colorado River are the San Francisco Mountains, among the loftiest in the West, the highest being 13,000 feet, surrounded by masses, cones, lava, etc. Judged by the bends and meanderings of the river the Grand Cañon of the Colorado is more than 200 miles in length, with an average depth of 2,000 feet and an average width of five miles. The most stupendous portion of the Cañon is the Kaibab division on the north, where it is more than a thousand feet deeper than anywhere else. The most remarkable and interesting phenomena of the topography in this region is partially owing to the manner in which the formations have been elevated or lowered between long faults, also to the amount of attrition to which the region has been subjected. The plateau region to the south of the Great Basin presents some striking contrasts to that at the north. In the latter section the corrugated and folded strata are filled with volcanic outflows, which have covered the lower portion of country, while in the plateau region, to the south of the Great Basin, the strata have been raised to a high elevation, without being hardened sufficiently to resist erosion, and possessing a variety of lithological character that gives complexity to resulting forms, which, affected by eroding agencies, have created the remarkable conditions they now exhibit. The cones of varied dimensions, which are to be seen in this plateau, are the accretions of lava which have been poured out from orifices in the mountains during the activity of volcanic agencies. Many of them are of huge dimensions, but there has been no such phenomenal overflows in the southern plateau as those which have characterized the northern volcanic regions.

Sierra Nevada Range.— The most important and conspicuous member of the Cordilleran system is the Sierra Nevada range — not alone as a system, but also for the richness and variety of its mineral deposits, its temperature, climate, soil, productions, geological formations, forests, scenery, and the character and number of the inhabitants. It is the western boundary of the Cordilleran system, as also the widest and loftiest portion of that system east of California. From its western side it is specially notable, because it descends nearly to the sea-level, while on the opposite side the plateau level is the extreme of its depression. Both the Sierra Nevada and Cascade ranges unite with what are called the Coast ranges, at certain points, and are separated from them at others by low but wide valleys, among which, and probably the most conspicuous, is the Great Valley of California.

This range, as already indicated, is composed of a granite core, inclosed by rocks of the Mesozoic period, the development of the latter increasing in the north, also in the section bordering upon the western declivity of the range and forming the auriferous belt of the Sierra. Another fact of importance is the presence of eruptive rocks of Tertiary and Post-Tertiary period in portions of the Cordilleran region. The volcanic materials are seen in large masses at places in the southern part of the Sierra, on the highest portion of the range, and at points where there are no slates nor mining nor washing for gold. The Sierra group diminishes in its altitude south of the Mount Whitney range, and at this point occurs the Kern River valley, containing several volcanic cones, which have the appearance of recent development, but are not known to have been in a condition of activity since the country was settled by the whites. Since 1870, however, the adjacent country appears to have been visited by earthquakes, and this very point was measurably affected by the earthquake of the spring of 1872. The region of volcanic cones and lava flows, however, is midway in Owens Valley on the east side of the Sierra, some distance from Lone Pine, and where the earthquake produced the most disastrous effects. Volcanic materials also cover the western part of the range further north, and from 39° 30′ north the rocks are hidden by eruptive materials of a more modern date, through which channels of no inconsiderable depth have been worn by water, and furnish access to the auriferous deposits to be found in the gravel of the buried river systems. Signs of recent volcanic activity are apparent at Lassens Peak, a solitary volcanic cone in 40° 30′ N. latitude, rising 10,537 feet above the surrounding country. Hot springs are also to be found in the same vicinity, in addition to mud lakes from which spouts of hot water and mud are thrown into the air to the height of several feet. In the immediate vicinity of Lassens Peak is a lake of hot water of large dimensions, wherein mud volcanoes are of frequent occurrence. Indeed, there are no points along the south crest of the Sierra where such striking indications of latent volcanic activity are to be seen as those at Lassens Peak. The range there is broken through by a fault, and south of it high ranges and deep cañons have cut through the volcanic strata and are deeply imbedded in the rocks underneath; to the north a depression exists filled with volcanic rocks that extend to the north and northeast for hundreds of miles, and become part of the plateau region in that section. Northwest of Lassens Peak is Mount Shasta, 14,440 feet high, furnishing evidences, near its summit, of volcanic activity at some remote period, nearly as pronounced as those seen in the vicinity of the Peak. As late as 1862 steam and gases were to be seen exuding from orifices at a point fully 425 feet below the summit.

Cascade Range.— The Cascade range to the north of Shasta is characterized by phenomena the same as that existing between Lassens Peak and Shasta. This continues beyond the northern boundary line of the United States. The ridge, however, that is the principal one of the range,

is not elevated, but volcanic cones of more than average dimensions rise at intervals. To the north of Mount Shasta what are apparently volcanic peaks dot the landscape, and many of them are conspicuous. Among these Mount Pitt and Mount Jefferson are prominent. Some of these groups exhibit conical forms while others do not. Equidistant between Pitt and Jefferson are a number of groups, the leading of which are the "Three Sisters," and throughout this portion of the range the presence of craters and outflows of lava give evidence of volcanic action at a recent date. To the north of Mount Jefferson, at a distance approximating 100 miles, the volcanic masses of the Cascade range have been cut through by the Columbia River; and at the Dalles, having an elevation at the east side of the range, the volcanic plateau of the Columbia commences. Mount Shasta, Mount Helena, and Mount Hood — the two former located on the north side of the river, and Mount Hood on the south side — are the most clearly defined volcanic cones of the range. All of these have an elevation of more than 10,000 feet. Mount Rainier is seventy-six miles from the Columbia River to the north, and next to Shasta is the most celebrated in the Cascade range. Owing to its location at a distance from traveled roads, surrounded by dense forests, etc., it is comparatively inaccessible. North of the latter peak is Mount Baker, conspicuous from all directions, having an altitude of 10,755 feet.

Notwithstanding the evidences of volcanic action, at a date not far distant, throughout the entire range, the condition of the eruptive agencies at present cannot be clearly described. There does not seem to be any indication of a recent overflow of lava in either the Cascade or Sierra Nevada ranges, such at least as would harden into rock when cooled. The rocks of these ranges are basaltic, and, in the strata beneath, evidences of vegetation of the Pliocene and Miocene ages are visible. The animal remains there, however, have not been identified.

There is an absence of indications tending to show that lava, or ashes, cinders, etc., have been cast out from the volcanic cones of the Sierra Nevada range at a comparatively recent period, but in some of the cones of the Cascade range such evidence is not wanting, particularly in respect to Mount Baker, where eruptions have occurred at intervals from 1843 to 1870 — also at Mount Hood, with appearances of a somewhat similar description in other cones of the range.

Coast Ranges.— What are known as the "coast ranges of California" are described as differing from the Sierra Nevada and Cascade ranges, being less elevated but more broken through by granite masses, and less infrequently covered with the products of volcanic eruptions. Their upheaval occurred at a date subsequent to that of the Sierra range, during the Tertiary period it is claimed, and has continued into the Post-Pliocene. To the south of San Francisco Bay, considerable areas of cretaceous rock are to be found, such being particularly the case to the east of the Monte Diablo range, becoming more and more pronounced further north, where the areas of Tertiary diminish in extent and volume. A number of features of geological interest are reported in connection with the Coast range, notably the metamorphosis which has been going on among the rocks, giving them an appearance that would indicate they belonged to an older part of the geological series, also the existence of serpentine and serpentonoid rocks in considerable groups. In these metamorphosed rocks, veins of quicksilver have been discovered and profitably worked at various points to the north and south of San Francisco Bay. Chromic iron also occurs, and in southern California gold has been found. To the south of the bay bituminous slate, several hundred feet in thickness, characterizes the range, and in the vicinity of Santa Barbara and Los Angeles, considerable amounts of bituminous matter have appeared upon the surface, which has hardened into a material strongly resembling asphalt. Efforts to develop these into producing wells of petroleum have not been attended with sufficiently pronounced results to justify operations upon any very extensive scale. Another product which has rewarded investigation into the resources of the range is an excellent quality of coal. This has been discovered in the range both in California and Oregon, and mines are at present successfully worked near Seattle, Washington, on Vancouver's Island, and elsewhere. The Sierra and Coast ranges become united in the northern part of California, and so continue into southern Oregon; but the development of the ranges is most effectively and comprehensively reached west of the San Joaquin and Sacramento Rivers. South of the valleys of the San Joaquin and Sacramento the ranges become topographically united. In California the Coast range is 400 miles long, with a width of from fifty to sixty miles, according to the range of coast line; the mountains in this area consisting of sub-ranges plainly defined, as also of inconspicuous ones. From Cape Mendocino to Point Conception these sub-ranges follow the direction of the coast, the elevation, more especially near the Bay of San Francisco, ranging from 2,900 to 4,100 feet in height, with Mount Helena, Mount Hamilton, Monte Diablo, and Mount Bache, severally, 3,790, 4,440, 3,856, and 4,343 feet high, being the more conspicuous of the peaks. In both directions, north and south of San Francisco Bay, the heights of the peaks increase; Mount Bailey to the north is 6,357 feet and the peak of San Carlos, to the south, approximates 5,000 feet. Geologically the range south of the bay consists of rocks of the Pliocene period. They are in very extensive masses and many hundred feet in thickness. Those extending east and west on the channel of Santa Barbara are lofty and abrupt, the most prominent being the Santa Infez and the Santa Monica, the latter consisting of stratified rock of the Miocene period, with a mass of granite extending through it, elevating the range to a lofty angle in the vicinity of the eruptive rock, where it becomes metamorphosed and from which, in both directions, it gradually recovers its normal condition and position. The ranges are more broken along the coast to the south, and the peaks attain to a lofty altitude, San Bernardino, San Jacinto and others being prominent.

GEOLOGY. *

Eastern Section of the United States.

The rocks of the Eozoic group form a continuous belt from the northeastern boundary southwesterly to Alabama. From their broadest expansion at the north, they gradually narrow southward through New England to New York and then expand southward through the Southern States. They form the mountain region of the Eastern States, and, together with the broad development of the same formations in Canada, skirting the Great Lake region and considerable areas about Lake Superior, form the margin or rim of the great interior region of comparatively horizontal Paleozoic formations, holding the vast coal areas of the continent. The natural geological and geographical outlets of this interior basin, with its stores of wealth in coal, iron, and fertile lands, are on the southwest, through the open valley of the Mississippi to the Gulf, and on the east, across the narrowest portion of the Eozoic at New York.

These Eozoic and Metamorphic rocks constitute what is generally known as the granitic region. It is the nucleus of the later rocks, of the Paleozoic on the west, and the Mesozoic and Cenozoic on the east. Of the principal divisions, the Laurentian is developed along the valley of the St. Lawrence, the Huronian in the west, and the Atlantic in the White Mountains of New Hampshire.

* The allusions in this section to a map refer to the latest geological map of the United States and Territories, by Professors Charles H. Hitchcock and William P. Blake, which cannot be reproduced here.

The Atlantic system is first carefully distinguished from the others in the first volume of the geological report of New Hampshire (1874). It is the same as the so-called White Mountain series, and has a large development along the Atlantic border. A considerable portion of the New England metamorphic rocks, particularly in Maine, is now referred to the Huronian system.

The Silurian and Cambrian systems are made to extend from the Paradoxides beds to the Lower Helderberg inclusive; in accordance with the general usage of American geologists. The Calciferous mica schists of Vermont, the Coös group and certain mica schists of New Hampshire, are provisionally included in this division. Certain schists in North and South Carolina, largely those called Taconic by Professor Emmons, are excluded, and referred to the Huronian upon the authority of Professor Kerr. A large area of quartzites in Minnesota and Dakota, consisting chiefly of the *Plateau du Coteau des Prairies*, are now for the first time ranked with this division. Heretofore opinion has been divided in respect to them, whether they should be called Huronian or Cretaceous.

The Devonian system is now separated from the Lower Carboniferous, and is chiefly developed over the interior of the continent.

The Triassic and Jurassic formations constitute long lines of sandstone in the east, and Gypsiferous beds west of the Mississippi.

The Cretaceous formation may be traced almost continuously from the northeast end of Long Island through the Carolinas to Alabama; thence northerly along the Mississippi valley to the mouth of the Ohio River; thence southwesterly into Mexico, and northerly to the British Possessions, covering immense areas in the Territories and in the States of the Pacific coast. The formation is perhaps the most extensive of any in the country. With the approval of Prof. Kerr we have represented a continuous area of Cretaceous, nearly 200 miles long, from the Neuse River in North Carolina to the farther side of the Great Pedee basin in South Carolina. This area is usually covered by Tertiary or Alluvium, but displays Cretaceous sections along all the great transverse river valleys. Large Cretaceous areas in Minnesota cover Eozoic and Silurian deposits, and are therefore only partially represented on the map.

The Tertiary rocks lie outside of the Cretaceous along the whole Atlantic coast, south of Cape Cod; and are immensely developed over the western portion of the country.

The Alluvium lies outside of the Tertiary along the coast, composing the peninsula of Florida and the Mississippi delta.

No volcanic rocks, properly so called, occur east of 103° west longitude Greenwich.

A small area of Cambrian has been described by Professor Charles H. Hitchcock as occupying a part of the Saco River valley in Maine. The granite in northeastern Vermont, and near Montpelier, may be partly of Devonian age. Three small outliers of the Catskill formation are represented in New York upon the authority of Logan's map. This formation is everywhere included with the Carboniferous upon the authority of Chancellor Winchell. The Long Island rocks are still considered as Cretaceous. The ragged edges of the Carboniferous rocks in northeastern Pennsylvania are not preserved. In North Carolina the Eozoic system is expanded to include several isolated patches of gneiss in the low country. This expansion causes the eastern boundary of this system to harmonize with that in Virginia, as delineated by Prof. W. B. Rogers.

The geology of Georgia is very little known; the Cretaceous outliers are given upon the authority of Sir Chas. Lyell. The Silurian areas of Ohio and northern Illinois are probably connected together across Indiana; the boundaries between the Silurian and Devonian, as given, being based upon Sir William Logan's map. The northwest part of Iowa, considered as Cretaceous, is said by Prof. White in his Iowa report to be so deeply covered by drift that no rocks appear *in situ*. The Devonian along the Red River, in Minnesota, is given upon the authority of Dr. Winchell's map. In Texas a few changes are made upon the authority of a manuscript map furnished by A. B. Roessler. The coal area of northern Texas is separated from that of the Indian Territory by the overlying Cretaceous along the valley of Red River. The Tertiary area of the Cross Timbers region is retained in accordance with the results of explorations in 1874, specially communicated by Prof. S. B. Buckley. Improvements will doubtless be made hereafter in the representation of the copper rocks about Lake Superior. We have not altered their delineation from that of the first edition.

A few general statements are suggested by even a casual inspection of the map. First, there is a wide contrast in color between the east and the west; indicating that the former, with its enormous supplies of coal and iron, is adapted by nature to be the manufacturing region, while the latter, with its immense plains and its veins of the precious metals, is more properly an agricultural and mining country. Second, the gradual thinning out of the Tertiary rocks on the Atlantic suggests the probability of a considerable submergence off the coast of New England and the British Provinces in very recent times, so that the later rocks are entirely concealed. Third, the arrangement of the formations along the lower Mississippi valley indicates a submergence commencing at the close of the Paleozoic and continuing down to the present era — the sinking of large tracts of land in southeastern Missouri in conjunction with the earthquake of 1812, shows that the line is still weak. The successive development of the several divisions of the Cretaceous and Tertiary below the mouth of the Ohio, proves that the valley has been gradually reclaimed from the Gulf of Mexico. Quite recently, also, the western water-shed followed the Cretaceous outliers from southeastern Arkansas to the "Five Islands" near the mouth of Bayou Teche. Fourth, the overflows of lava are confined to the Rocky Mountain region and westward. There are no evidences of igneous overflows in the east later than the Jurassic. Fifth, the great plains west of the Mississippi, occupying more than a fourth part of the country, belong to nearly horizontal deposits of the Cretaceous and Tertiary. Sixth, the central portion of the main Rocky Mountain range seems to belong to the Eozoic system; but not to have been elevated extensively so early as the same formation along the Atlantic border. The principal epoch of Rocky Mountain elevation seems to have been in the later Tertiary.

Western Section of the United States.

Eozoic and Paleozoic.— Paleozoic formations have been traced to the shores of the Pacific, and their representation forms a conspicuous feature of the map from the Rocky Mountains westward throughout the whole area, and especially in the great interior basin region where there are numerous parallel mountain ranges trending from north to south. Over this western portion of the map the divisions of the Paleozoic are not indicated by different colors as they are on the eastern portion. The single blue color represents the whole or any single member of the Paleozoic, either the Silurian, the Devonian, or the Carboniferous, or all of them. The divisions have not yet been traced out except in a few limited areas.

The best known member of the system is the Carboniferous limestone, believed in general to be the Sub-carboniferous, which has a wide extension, having been identified as far west as the seaward slopes of the Sierra Nevada, in the Humboldt Mountains, the Wahsatch, and in the Rocky Mountain system of elevation from Mexico to the northern boundary. It forms the summits of ranges about the Great Salt Lake, and is the prominent rock of many parallel ranges extending northward into Montana and beyond into British America. It is believed to constitute an

important feature of the Salmon River ranges of mountains, comparatively unexplored, and of the Blue Mountains in southeastern Oregon. The formation is, in general, much uplifted, and forms the crest or highest portions of many mountain ranges up to an elevation of 13,000 feet or more. But in the broad region drained by the Colorado and its tributaries, the Carboniferous, together with older divisions of the Paleozoic, and the later formations of Mesozoic time, are comparatively undisturbed, and form a broad plateau region of nearly horizontal strata through which the streams have cut their way and expose unbroken sections of the whole series of rocks from the early Silurian, resting upon the Eozoic, to the Tertiary surmounted by volcanic outflows. The Mogollon Mountains of Arizona mark the southern limits of the plateau region, beyond which the formations are uplifted and extend in parallel ranges southeastward into Mexico. Thus a deep Carboniferous sea appears to have extended over the greater portion of the United States. A period of elevation succeeded with the deposition at the west as well as in the eastern portion of the country of sandy and clayey deposits, the foundation for the growth of plants and the formation of coal-beds. Coal measures and thin seams of coal are found in the Rocky Mountains at Santa Fé, and recently they have been shown to exist as far west as the Pancake range of mountains in Nevada (Lon. 115°) with workable beds of coal. So far as yet observed, coal-seams do not exist in the Carboniferous in the northwest.

Devonian beds have been recognized in the White Pine Mining District in Nevada and probably occur far to the north and south of that point in the same and other parallel ranges. They have also been identified in the Wahsatch, southeast of Salt Lake City, and no doubt have a very considerable geographical extension in connection with the Sub-carboniferous limestone. Devonian sandstones are reported in the Calitro Mountains, Arizona; but in a section near El Paso, from the Potsdam upward, there is a notable absence of Devonian beds. This section is believed by Mr. Tenney to exhibit the equivalents of the Potsdam sandstone, the Trenton limestone and the Oneida conglomerates with the Carboniferous resting unconformably upon them. An absence of Upper Silurian and Devonian beds has also been noted by Hayden in sections about the Black Hills and the Laramie range. But according to Comstock, the whole Paleozoic series, from the Lower Silurian to the Carboniferous, inclusive, is found upon the eastern slope of the Wind River Mountains dipping away from the metamorphic rocks.

Limestones of the Quebec group have been identified by Bradley, near Malade City, Idaho. The equivalent of the Potsdam sandstone is described by Hayden and others as existing in the Black Hills and northern ranges of the Rocky Mountains, especially in the Big Horn Mountains at the head of Powder River and in the range known as the Tetons. A quartzite underlying the limestones of the Wahsatch and resting unconformably upon the upturned edges of Eozoic rocks, is referred by Professor W. P. Blake to the Lower Silurian. The Primordial has also been observed by Clayton in southern Nevada (Lon. 116°), and on Schell Creek, seventy-five miles northeast of White Pine.

It may be said, in general, that the prevailing formations in the silver-mining districts throughout Nevada are made up of limestones and sandstones of Paleozoic age, either Carboniferous, Devonian, or older, in connection with Eozoic, granitic, syenitic, porphyritic trachytic, and volcanic rocks. Dikes of porphyry and dioritic rocks are numerous, but, in general, are too narrow and limited in their breadth to be satisfactorily delineated on the map.

The phenomena of uplift and plication of the strata are exhibited on a broad scale in the Rocky Mountains and westward in all the mountain systems, though, in general, the folding is not abrupt and steep, and monoclinal ridges are most common. The principal area of folding lies to the westward of the Wahsatch range in the Great Basin, where the parallel mountain ranges are numerous and inclose long and narrow valleys partially filled by the debris and wash from the adjoining ridges, so that the rocks are covered from view. The region of the greatest lateral compression is the Sierra Nevada, where most of the strata stand on edge. The Cretaceous and Tertiary formations of the Coast Mountains are also plicated.

The rifts and fissures of the rocks giving rise to veins and mineral deposits follow, in general, the lines of easiest fracture presented by the upraised strata, parallel to the general axes of uplift. A general longitudinal arrangement results, and determines to a great extent the distribution of population, lines of communication, settlement, and occupation of the country.

There are evidences in several places of considerable dislocations and breaks in the strata for great distances; as, for example, along the eastern base of the Sierra Nevada, and in the Colorado plateau, where Powell has observed a succession of vertical displacements extending in a northwesterly and southeasterly direction, one of these lines of break being nearly under the extinct volcano of San Francisco Mountain and coincident with the edge of the mesa terminating the plateau on the south.

The wide extension of the Eozoic rocks as the foundation of the western part of the continent is well established. They underlie the Paleozoic unconformably, and are in general crystalline and uplifted at high angles. In the Rocky Mountain system, particularly near Santa Fé in New Mexico, in Colorado, and in Wyoming, gneissic strata are traversed by veins and dykes of flesh-red granite. Farther west this granite disappears and gray granite prevails, especially in the Wahsatch, the Humboldt, and the Sierra Nevada. In the Wahsatch the Paleozoic series rests upon the upturned edges of older formations, now in the condition of compact granite but retaining distinct traces of the original layers of deposition. This granite is flanked by gneissic beds, and it closely resembles the granite of the Humboldt range and of the Sierra Nevada, which two great ranges may also be regarded as prominent lines of exposure of the most ancient rocks. The Eozoic is also exposed at many points in the ridges of the Great Basin, at the bottom of the cañon of the Colorado, and southward through Arizona into Mexico. In Montana Territory the rocks are gneissic, and are traversed by gold-bearing quartz veins.

Mesozoic.— The most widely distributed and recognized member of the Mesozoic series is the Cretaceous, which underlies the Great Plains westward from the Missouri, forms the table-lands of Texas known as the Llano Estacado, and appears all along the eastern base of the Rocky Mountains. Beyond this chain it is spread over the great plateau region of the Colorado River, finding its principal limit on the north and west in the Wind River, the Uintah, and the Wahsatch Mountains. Farther west it reappears east of the Cascades in Oregon, is heavily developed about Puget Sound and Vancouver's Island, and, together with uplifted Tertiary beds, forms the bulk of the ranges of the Coast Mountains in California.

In southwestern Texas the lower members of the formation consist of thick beds of compact limestone, forming cliffs hundreds of feet in height along Devil's River and the Rio Grande, while the higher members forming the Llano become more clayey and sandy. Coarser materials also prevail in the formation upon the western coast, where sandstones and shales prevail and pass upward conformably into the Eocene and Miocene Tertiary.

East of the Rocky Mountains the Cretaceous is underlaid by Jurassic and Triassic strata, the latter being largely developed and exposed at the surface in northern Texas, the Indian Territory, and Kansas. This member of the Mesozoic consists chiefly of red shales, marls, and sandstones, with an abundance of gypsum. The Triassic beds are also found throughout the Colorado basin and extend west of the Vir-

gen. They have been identified in several of the uplifts of the Great Basin area, particularly in the Virginia and Pine Nut ranges near the eastern base of the Sierra Nevada, associated with syenitic and other plutonic rocks, and also in the west ranges of the Humboldt Mountains, notably at Star Mountain, rising to a height of 9,000 feet and largely made up of Triassic strata.

Jurassic, and probably Triassic beds, highly folded, form a part of the western slope of the Sierra Nevada of California, and are the chief repositories of the gold-bearing veins and of the copper ores. With these beds the Cretaceous formations are not conformable. Thus the great uplift of the Sierra Nevada, and of many parallel ranges in the Great Basin, appear to have taken place at the close of the Jurassic period, introducing a great change in the topographical and physical conditions of the continent.

The relations of the Mesozoic, in the Sierra Nevada, to the Paleozoic, have not been satisfactorily shown. The Carboniferous has been identified near Fort Reading by Trask, and in the map the limestones of the range to the southward have been considered as belonging to that system. But of whatever age, they as well as other and apparently older strata, in a metamorphosed condition, are all conformable with the Mesozoic.

Cenozoic.— Tertiary deposits over the western part of the continent are found, in general, nearly coincident in geographical distribution with the Cretaceous, there being no break in the continuity of the deposits from below upward. Along the Pacific border, the Eocene, Miocene, and Pliocene divisions have been recognized and are all of marine origin and attain a great thickness. They partake, in the Coast Mountains, of the plications of the Cretaceous, but are, in general, nearly horizontal along the base of the Sierra Nevada.

Between the Rocky Mountains and the Missouri River, on the Great Plains, extensive areas are covered with Tertiary beds through which rivers have cut their way to the underlying Cretaceous. So also in the Green River basin, north of the Colorado plateau in Wyoming, there is a wide area covered with horizontal Tertiary deposits eroded by streams to a great depth. These are not only of marine origin but are mingled with brackish and fresh-water deposits which, as well as extended basins in the Tertiary of the Upper Missouri region, were deposited in shallow lakes partially or wholly shut off from the sea. These deposits in Wyoming overlie unconformably an earlier series of Eocene beds, characterized at the base by the general presence of workable seams of lignitic coal, found not only along the Rocky Mountains and in the Green River basin but in California and Oregon; thus showing that at the close of the Cretaceous epoch the greater part of this western area had emerged from the sea and was covered with a wide-spread luxuriant vegetation.

The modern lacustrine deposits, to which reference has been made, constitute one of the most interesting records presented to us in the whole series of formations. They show the former extent of immense fresh-water lakes, now either wholly or partially dried up, leaving behind them floor-like beds of fine clay and well-marked terraces and water-lines. The largest of these ancient lakes may be designated as the Humboldt, the Timpanogos (of which the present Great Salt Lake is the remnant), the Tulare, and the Coahuilla, the last having occupied the long valley at the head of the Gulf of California, now a desert.

Volcanic.— Lofty extinct volcanoes with enormous outpourings of lava form a striking feature of the geology of the western portion of the United States. The broadest area covered by lava is in the valley of the Columbia River, and of the Snake River in Oregon. The principal field extends in a nearly unbroken plain over five degrees of longitude and three of latitude. There is a continuous line of extinct cones and lava outflows along the Sierra Nevada of California, and the Cascade Range of Oregon, from latitude 36° to the northern boundary. A large part of the Cascade range is made up of the outpourings of volcanoes, and at the gorge of the Columbia the superimposed lava beds attain a thickness of between 3,000 and 4,000 feet, resting upon horizontal Miocene or Pliocene deposits.

The interior region east of the Sierra Nevada is studded at intervals with extinct cones and lava streams, many of them looking as fresh as if they were now cooling. Some of the more important of the extinct volcanoes of the interior have poured floods of lava out over the Cretaceous and more recent formations of the Colorado plateau. Lava plains of great length and breadth are found along the Gila River and in New Mexico. Another great center of igneous action exists upon the head-waters of the Yellowstone and the Snake River, from which lava appears to have flowed throughout the whole length of the Snake River valley, joining the lava fields of the Columbia. The great geysers of the Yellowstone region show that thermal action has not yet wholly ceased, and similar evidences of volcanic heat are exhibited at intervals along the eastern base of the Sierra Nevada, and in the Coast Mountains of California.

Glaciers and Erosion.— There is no extensive drift formation corresponding to the great northern drift of the Eastern States, nor has there been such a wide-spread and deep erosion of the whole surface as that which scooped out the valleys of the Great Lakes and swept away a large portion of the Paleozoic strata from Maine to Alabama. The erosion of the western area has been comparatively local, being confined chiefly to river valleys, but is exhibited on a stupendous scale in all the mountain ranges, especially on the western slope of the Sierra Nevada, where transverse valleys have been cut out of the rocks to a depth of 3,000 feet or more. Farther in the interior the Great Cañon of the Colorado is the grandest example known of river erosion, this stream having cut out a channel a mile or more in depth through the horizontal strata of all ages.

Enormous accumulations of bowlders and gravel deposited by streams are found upon the flanks of the Sierra Nevada, and are the chief repositories of the placer gold. The deposits appear to be in part the result of ancient systems of drainage, and in part to be due to glacial action. The Sierra Nevada, the Cascades, and the high ranges of the Rocky Mountains have all been the theater of enormous glaciation by local and wide-spread glaciers. These glaciers have left lateral and terminal moraines of great extent, particularly in the region above the Yosemite Valley, California, where the ice-sheet must have been of unusual thickness, and at the head-waters of Kern River about Mount Williamson. The effects of glaciers have been traced as far south as latitude 35°, and remnants of glaciers are still to be found in the deep and protected valleys of the higher mountains of California and Oregon, increasing in magnitude to the northward until, in Alaska, they are of magnificent proportions, filling broad valleys and descending to the sea-level.

The geology on the whole is much more intricate and complicated than at the east. The transitions from one formation to another are rapid and sudden. It is a region of great disturbance, of broken, irregular topography, of high mountains, deep valleys, and of great variety in climate, soil, and productions. The coast is precipitous and the good harbors are few. The chief geographical outlets from the interior are the Columbia River in the northwest, the Golden Gate at San Francisco, and the Colorado valley on the south, leading to the Gulf of California; but this drains a comparatively inaccessible and barren region. Practically the outlet of the interior basin is by railway to San Francisco, all the longitudinal valleys north and south being tributary to one great east and west line. For the Rocky Mountain region, the Rio Grande and the valleys tributary to the Mississippi excavated in the later and yielding formations of the Secondary and Tertiary period, give the most direct and advantageous means of communication.

Coal Measures.

According to Professor Charles H. Hitchcock, the observations made by American geologists establish the fact of a fourfold division of the Carboniferous series, viz.: 1. The lowest, sandstones and conglomerates known as the Waverly sandstones of Ohio, Marshall, Napoleon, and Michigan groups of Michigan, Catskill of New York, the Vespertine of Pennsylvania, the Knobstone of Kentucky, etc. 2. The Mississippi group, or Carboniferous or Mountain limestone, which is supposed to be the equivalent of the Umbral red shales of Pennsylvania and Virginia. 3. The millstone grit, or a series of sandstones and conglomerates, the seral of Pennsylvania and Virginia, the conglomerate of Ohio, etc. 4. The Coal Measures, from which the chief supply of our coal is derived. In some regions there are said to be good workable beds below the millstone grit.

There is considerable diversity of opinion in respect to the minute subdivision of the Coal Measures, and on the map published with the ninth census of the United States there is only a division in two parts, the upper and lower. The line of demarcation in the Appalachian basin is the Pittsburg bed or its supposed equivalent; while in the Illinois and Missouri basins the dividing line cannot be synchronized with the same horizon, but the division is a natural one.

Observations show that the Coal Measures are grouped in the following natural basins:

New England Basin.— This lies in Massachusetts and Rhode Island, and is estimated to cover 750 square miles. The coal is a plumbaginous anthracite, used to advantage in some smelting furnaces. It is believed that eleven different beds exist; and, as seen in the Aquidneck mine at Portsmouth, R. I., their maximum thickness is 23 feet. Professor Hitchcock estimated the whole thickness of the Coal Measures at 6,500 feet, and the Coal Measures proper at 2,500 feet. The plants from this field, according to Lesquereux, correspond with those of the Salem and Mammoth Anthracite and the Lower Freeport Bituminous beds in Pennsylvania.

Anthracite Basins of Pennsylvania.— These basins are divided into three groups: the first, Southern or Schuylkill Basin and Mine Hill, 146 square miles; the second, Middle or Shamokin, 50 square miles, Mahanoy, 41 square miles, and Lehigh Basins, 27 square miles,— in all 128 square miles; and the third, Northern, or Wyoming and Lackawanna Basin, 198 square miles,— a total area of 472 square miles. Originally these basins must have formed part of a single coal-field, which by later elevating forces has been extensively folded, the character of the coal changed from bituminous to anthracite, and the strata broken into fragments through fractures and erosion. This is shown by the similarity in number, succession, and thickness of the beds of coal in the several parts; also by the constancy of the character of the conglomerate forming the flow of the Coal Measures. The obtaining of exact information respecting the amount of coal in any basin is at present impractical; the beds vary so much in area and thickness that only approximate estimates can be made. Prof. Henry D. Rogers calculated that the first coal-field contained an average thickness of 100 feet of coal; that the second and third carried about 60 feet; and that the general average of all three was about 70 feet. Fourteen beds at Pottsville were enumerated by Daddow and Bannon, having a maximum thickness of 205 feet and a minimum of 60 feet, with the accompanying strata varying from 2,175 to 820 feet in thickness. The production of anthracite coal in Pennsylvania in 1889 aggregated 45,544,970 short tons.

Appalachian Field.— This basin comprises 59,105 square miles, covering parts of nine States, viz.: Pennsylvania, 12,302; Maryland, 550; Ohio, 10,000; West Virginia and Virginia, 16,000; Kentucky, 8,983; Tennessee, 5,100; Georgia, 170; and Alabama, 6,000. This basin is much broader over its northern area, contracts through Tennessee and Northern Alabama, but expands considerably at its termination in Alabama, though not to such an extent as in West Virginia and Ohio. Considered in connection with its elevation above the sea, nearly the whole of the Appalachian coal-field is an elevated plateau, 2,000 feet above the sea in Tennessee, the principal depression lying along the Ohio River below Pittsburg. The basin is subdivided by minor undulations which are of the greatest consequence in the location of mines. The most notable ones, chiefly in Pennsylvania, are the small Broad Top; the Cumberland; the First, which stretches from a point east of Williamsport southwesterly into Maryland; the Fourth, which reaches from the Barclay region to the bend of the north branch of the Susquehanna and thence up the west branch; the Fifth, which begins at Blossburg and passes down to the southwest side of the Laurel Hill range into West Virginia; the Sixth, which begins on the Tioga River in New York and terminates at the Kiskiminetas River two and one-half miles from its mouth; the Seventh, which begins at the Smethport outlier and crosses the Alleghany just above the great bend; and the Eighth, which is regarded as occupying the rest of the basin lying to the west of those enumerated. These undulations have not yet been identified in West Virginia and Kentucky. The Ohio River runs through the most depressed portion of the whole basin. In consequence of the river erosion a narrow exposure of the lower measures follows the Ohio both at the northern and southern limits of the upper group. In Tennessee an anticlinal axis divides the area into two basins. In Alabama there are four basins; the Coosa field, a long narrow strip crossing the Coosa River, with the small area nearly reaching to the Georgia line; the Cahawba field, a narrow club-shaped area, extending farthest south of any, and supposed to be on the same line with the long trough terminating at Chattanooga; the Black Warrior field, the eastern border of the great expanse to the northwest, connecting with the eastern basin in Tennessee; and the fourth field, the balance of the coal area in the State. The production in Alabama in 1889 aggregated 3,572,983 short tons.

Michigan Basin.— This basin has an area of 6,700 square miles, with 123 feet of measures, and a maximum of eleven feet of coal. The coal is thickest in the center, thinning out to nearly the thickness of paper around the edges. The production in Michigan in 1889 aggregated 67,431 short tons.

Illinois Basin.— The Coal Measures of this basin occupy about 47,188 square miles, in the States of Illinois, Indiana, and Kentucky, and some geologists incline to the belief that the beds of coal in this basin are equivalents of corresponding ones in the Appalachian field, on the supposition that the two fields were connected at the time of the formation, then subsequent separation being due to erosion. The lower part of the Carboniferous is continuous from one basin to the other, but the delineations of the Coal Measures themselves indicates a wide gap between the two areas, even where they approach nearest to each other in Kentucky. In this field the beds of coal are not so thick as in the Appalachian, though their number is about the same. The thickness of the measures is also greatly reduced, while the limestones are more abundant, thus giving evidence of different conditions of formation. These differences are intensified in the Missouri field, save that the measures are almost as thick as in the east. The coals themselves are also more apt to be impure, while there is an abundance of good workable beds, as shown by the statistics of production. The measures in Indiana occupy 6,500 square miles and contain twelve beds of coal, with an aggregate thickness of 40 feet above the millstone grit. The eastern zone occupies about 450 square miles. The coals are non-coking or free-burning, and are generally known as the "block coal," because it comes out in square pieces, the bed being traversed by a multitude of joints or seams. This coal is largely used in the

smelting of iron. The western zone is the most extensive, and the coals are of good quality and considerable thickness. The measures in Illinois occupy 36,800 square miles, are 600 feet thick, and contain ten beds of coal with an aggregate thickness of 38 feet. The workable coals belong to the lower division. This basin shows certain peculiarities in its structure varying from the normal type. At the south end the underlying strata are of Carboniferous age, just older than the Coal Measures of the north in Illinois; these are outcrops of the Devonian and Silurian, the lower members of the latter system adjoining the Carboniferous on the north side of the field. The upper Coal Measures rest upon Silurian rocks in northern Illinois instead of the lower coal series. It would appear, therefore, that there must have been a gradual sinking of the land to the north during the age of the Coal Measures, and the newer beds have been brought successively into direct contact with much older formations. A somewhat similar condition is found in western Kentucky. The measures in Kentucky occupy 3,888 square miles, and are about 612 feet in thickness, including the millstone grit. There seems to be nine beds of coal in this area, varying in thickness from two to five feet, and measuring 29 feet in all. The production of this basin by States in 1889 was: Illinois, 12,104,272 short tons; Indiana, 2,845,057; Kentucky, 2,399,755,—in all, 17,349,084 short tons.

Missouri Basin.— This is the largest of all the coalfields of the country in territorial expanse, amounting to 84,343 square miles, though thinner and with fewer beds of coal than the Appalachian. The lower division occupies all the eastern border, while the higher portions are situated upon the western side and pass beneath Permo-Carboniferous and Cretaceous strata. This territory has been less studied than the others. The measures of Iowa have been divided by Prof. C. A. White, the State geologist, into three parts, each about 200 feet in thickness; the area of the lowest, which is the most important for producing coal and occupies the eastern border of the tract, is about 6,100 square miles; of the middle, 3,400; of the upper, 8,500,—in all 18,000 square miles. As the lower divisions extend beneath the higher, it is probable that the whole 18,000 square miles are to be regarded as workable territory. The measures of Missouri, according to G. C. Broadhead, the State geologist, cover an area of about 23,100 square miles in Missouri. This series, as in Iowa, is divided into three parts: the upper, or barren measures, occupying 8,406 square miles; the middle, 2,000; and the lower, 12,420. The aggregate thickness of the upper division is 137 feet, including about four feet of coal in two seams of one foot each, and a few streaks. The middle division is 324 feet thick with seven feet of coal, including two workable seams of 21 and 24 inches, a third of one foot worked under favorable circumstances, besides six seams of extreme thinness. The lower division is from 250 to 300 feet thick, embracing five workable beds, varying from one-and-one-half to four-and-one-half feet each in thickness, and thin seams between six and eleven inches, besides unimportant streaks in all, 13 feet 6 inches. The total thickness is therefore near 1,900 feet of coal measures and 24 feet 6 inches of coal. The measures of Nebraska cover an area of about 3,600 square miles. The outcrops belong entirely to the upper of the three divisions of Iowa and Missouri. Beds of the thickness of from six to twenty-two inches are reported from different counties; the coal is usually inferior, and it is the general belief of geologists that good workable coals are yet to be discovered in Nebraska. They may yet be found at considerable depths. The measures of Kansas occupy an area in that State of about 17,000 square miles. The same three divisions occur here as in Iowa and Missouri. The rocks dip slightly to the northeast, and consequently the upper unproductive division is the one most largely developed. Professor Swallow has examined 22 different seams of coal varying from a few inches to seven feet in thickness, with ten more than a foot thick, the whole amounting to 2,000 feet in thickness, being made up of more than 80 different seams of limestone. The production of Kansas in 1889 aggregated 2,221,043 short tons. The measures of the Indian Territory are believed to cover about 13,000 square miles; but little is known of the coal outcrops, excepting that the Missouri, Kansas, and Texas Railroad Company find good banks of coal several feet thick at several places along their line. The measures of Arkansas contain two beds of coal beneath the millstone grit, each four or five feet in thickness, Prof. D. D. Owen estimates the area occupied by the coal-bearing rocks in this State at 12,000 square miles, while Professor Macfarlane states it to be 9,043 square miles. The production of Arkansas in 1889 aggregated 279,584 short tons.

Texas Basin.— This basin covers an area of 6,000 square miles, the measures having an estimated thickness of 300 feet, and showing from two to four seams of coal at Fort Belknap, and six miles farther north another one five feet thick. This field is probably a continuation of the Missouri, as the space between them, along the valley of the Red River, is occupied by newer and overlying formations. The production of Texas in 1889 aggregated 128,216 short tons.

Triassic Coal.— The outcrops of a later coal are shown in Virginia and North Carolina. The best known is the Chesterfield County field near Richmond, Va., estimated at 185 square miles. Coal was mined here before the opening of collieries in any other part of the country. The thickness of the beds varies, the largest being at the Creek Pit, where 52 feet of clear coal are contained in a thickness of 58 feet. There are two other Triassic areas in Virginia, but they are not known to contain beds of coal. The most southern one in North Carolina is known as the Deep River basin, containing five beds, having a thickness of three, one, three, two, and four feet respectively. It is known to be 30 miles in length with a width of from 12 to 14 miles. The other is the Dan River field, about 40 miles in length and from four to seven miles wide. The coals are less promising than in the other field.

There are other Triassic areas in the United States, but no coal of any consequence is known to occur in them.

Development of the Coal Industry.— In the following table is presented a statement of the animal production of anthracite and bituminious coal from the beginning of 1880 to the close of 1889. It is interesting to note in connection with this table the rapid growth of the bituminous or soft coal production as compared with that of anthracite or hard coal. It is seen that while the production of anthracite increased from 25,580,189 long tons in 1880 to 40,665,152 long tons in 1889, the bituminous production increased from 38,242,841 long tons to 85,432,717.

TABLE VII.— ANNUAL PRODUCTION OF COAL IN THE UNITED STATES, 1880–1889.

Year.	Pennsylvania Anthracite.			Bituminous Coal.		
	Quantity.		Value.	Quantity.		Value.
	Long tons.	*Short tons.*		*Long tons.*	*Short tons.*	
1880....	25,580,189	28,649,811	$42,196,678	38,242,641	47,508,133	$58,443,718
1881....	28,500,016	31,920,018	64,125,036	48,365,341	53,961,012	60,224,344
1882....	31,358,264	35,121,256	70,556,094	60,861,190	68,164,533	76,076,487
1883....	34,336,469	38,456,845	77,257,055	68,531,500	76,755,280	82,237,800
1884....	33,175,756	37,156,847	66,351,512	73,730,539	82,578,204	77,417,066
1885....	34,228,548	38,335,974	76,671,948	64,840,668	72,823,821	82,347,648
1886....	34,853,077	39,035,446	76,119,120	66,646,947	74,644,581	78,481,056
1887....	37,578,747	42,088,197	84,552,181	79,073,227	88,562,014	98,004,656
1888....	41,624,611	46,619,564	89,020,483	91,107,002	102,039,843	101,860,529
1889....	40,665,152	45,544,970	65,721,578	85,432,717	95,684,643	94,504,745

It is only necessary to refer here to the actual effect shown by the increasing use of bituminous coal, of coke, and of gas to the displacement of anthracite coal,

first as a manufacturing fuel, and then as a domestic one. For manufacturing purposes bituminous coal is rapidly superseding anthracite, except in those eastern cities where rigid smoke-preventing ordinances are enforced, and even in these cases by the use of smoke-consuming devices, bituminous coal is supplanting anthracite to an appreciable extent, while coke and gas, the products of bituminous coal, have made decided inroads into the anthracite household trade. It is not to be expected that anthracite production will increase materially in the future. In addition to the fact that the markets are becoming comparatively more and more restricted on account of the increased use of other fuels and to the changing conditions of life in the large cities of the east, the "bonanza" seams are becoming exhausted; and workings are being constantly carried to greater depths, which means greater expense in the operation of the mines, and in getting rid of enormous quantities of water. As mining conditions become more exacting the higher are the wages to be paid for mining; and the operators are therefore faced with a constantly to be expected increased cost of production, which must be added to the selling price of the fuel. The construction of the modern office buildings and apartments in the large cities of the east have had a perceptible influence on the consumption of anthracite, in the fact that thousands of former individual users of domestic sizes of anthracite now live in steam heated houses and use gas for cooking purposes. These buildings have, on the other hand, created a market for the small and formerly unusable sizes of coal, which to some extent makes up for the loss of markets for the domestic or profitable sizes.

Production of Coal, by States, from the Earliest Times to the Close of 1889.—The early history of coal production in many States has not been recorded in any official reports. In some cases it has been possible to secure scattered statistics of production interspersed with more or less accurate "estimates," but there are only one or two instances where consecutive records are obtainable. The accompanying table has been prepared from all available sources, missing data being supplied by estimates based upon the best information obtainable. The most complete record of coal production is that of the anthracite region of Pennsylvania from which shipments began in 1820, and since that date the records have been carefully preserved. The earliest record of production in that region was six years earlier, when an output of 22 short tons is reported to have been obtained. An estimated production of about 800 tons is distributed through the period between 1814 and 1820. The records of anthracite shipments, as reported elsewhere, have in this table been reduced to short tons and 10 per cent has been added to the shipments as an estimate of the coal sold to local trade or consumed at the collieries.

So far as we know, the earliest production of bituminous coal was made in the Richmond basin of Virginia. One authority states that 54,000 short tons were produced there in 1822, and that in 1824 the production amounted to 67,040 tons; in 1826 to 88,720 tons, and in 1828 to 100,080 tons. In each of these years the output exceeded that of Pennsylvania anthracite, but that condition ceased permanently in 1829, although the production of the Richmond basin continued to increase until 1832. It then began to decline and by the middle of the last century had almost disappeared.

The development of the Piedmont region, which at that time belonged to Virginia, began in 1855, and until the opening up of the Pocahontas region in 1882 practically all of Virginia's production came from the northern part of the State.

Next to the anthracite region of Pennsylvania, the most authentic records of coal production in the United States are of the Cumberland-Piedmont district of Maryland and West Virginia. The first openings were made in Maryland on the north side of the Potomac River, and shipments began as early as 1842, 1,708 long tons of 2,240 pounds having been shipped in that year. In the accompanying table the production of the Cumberland field has been reduced to short tons and the percentage for colliery consumption has been added in order to arrive at the total production. Until 1855 all of the shipments were from Maryland.

The early records of Pennsylvania bituminous production are sadly wanting. The census for 1840 showed that the total production in that year was 464,826 short tons. This is the earliest date of which there is any record, although it is practically certain that some bituminous coal was produced in Pennsylvania prior to that year. Another authority gives the bituminous production of the State in 1846 as 760,000 tons, while still another states that in 1847 it was only 399,840. From 1841 to 1845, inclusive, and from 1848 to 1859, inclusive, there are no records of production. The census of 1860 states that the output was 2,679,773 short tons. In 1864 the production had increased to 5,839,000 tons, and in 1870 it amounted to 8,736,399 tons, since which date the records are practically complete. Estimating the production in the years for which the records are not obtainable, we find that the total output of bituminous coal in Pennsylvania has amounted, approximately, to 1,251,000,000 short tons, or about 300,000,000 tons less than the production of anthracite in the same State, making the entire production of coal in Pennsylvania during the history of the industry in that State, approximately, 2,805,000,000 short tons.

Next to anthracite mining in Pennsylvania and the records of the Richmond basin in Virginia, the earliest statistics of coal mining are for the State of Illinois. The first record found is that coal was mined in Jackson County in 1810; the locality was on the Big Muddy River, and the mine was worked by drift along the outcrop in the bluffs. A flatboat was loaded with coal at this place and shipped to New Orleans. Again it is stated that in 1832 several boat loads were sent from the same vicinity to the same market. Another record is found stating that in 1833, 150,000 bushels (6,000 tons) of coal were mined in St. Clair County and hauled by wagon to St. Louis. The census of 1840 states that coal was mined in 19 counties of Illinois, with a production of 16,968 tons. From 1840 to 1860 (a period of 20 years) the Bureau of Statistics is without any general or special data in regard to the development of the coal-mining industry in the State, although there are some scattering statistics to be found in the geological reports of the State. The statistics of production from 1841 to 1859, inclusive, and for the other years for which no special information is obtainable, have been estimated.

In the well-known work, *Statistics of Coal*, by R. C. Taylor (1848), the author states:

> "The existence of this combustible (coal) was proved by the French explorers at an early period. It was certainly known to Father Hennepin in 1679 (almost a hundred years before the Pennsylvania coal was discovered), and is marked on the map which illustrates his journal. He points out a "cole mine" about Fort Crevecoeur, on the Illinois River, near to the site of the present Ottawa."

Although some coal was undoubtedly produced in Ohio prior to 1838, that is the first year in which any production is recorded, the output being 119,952 tons. The census of 1840 shows that the production was 140,535 short tons, and the census of 1860 gives the State an output of 1,133,596 short tons, the history of production of the years between 1840 and 1860 being entirely lacking. Since 1860 the records are fairly accurate.

Among the States west of the Mississippi River the earliest production reported is in Missouri and Iowa, by the census of 1840, Missouri being credited with an output of 9,971 short tons and Iowa with 360 short tons. It is probable that very little coal was mined in either of these States prior to that time, and it may be considered that the industry began at about that date.

The first coal discovered on the Pacific coast was in the State of Washington, in 1852, and the first mine was opened in Whatcom County, in 1854, shipments being made from there to San Francisco by water

Table VIII. Production of Coal, by States, from 1814 to 1889.

a From 1871 to 1888, inclusive, production reported in this column is due principally to colliery consumption, which in some years was estimated and not included in the distribution by States. Since 1888, small, irregular production from several unimportant sources has been included in this column.

a From 1871 to 1888, inclusive, production reported in this column is due principally to colliery consumption, which in some years was estimated and not included in the distribution by States. Since 1888, small, irregular production from several unimportant sources has been included in this column.

until 1870, when the Seattle, Renton, and Talbot mines, in King County, were opened and began shipping coal also to San Francisco. There are no records, however, of any production prior to 1870, when an output of 17,844 tons was reported.

Although California has never taken high rank as a coal-producing State, it comes next in order in the history of early production, an output of 6,620 tons being reported in 1861. This increased almost steadily each year until 1874, when the maximum output of the State (215,253 short tons) was attained. It then declined rapidly until 1876, when the production was just about one-half what it had been three years before. Since that time the industry has been rather irregular, the production depending upon many outside influences.

Among the States whose history of coal production does not antedate 1863, the records are fairly complete, although we can feel satisfied that in a number of instances coal mining began prior to the earliest dates given in the accompanying statement. In Indiana, for instance, the initial production is given for 1870, with an output of 490,414 short tons. Coal mining began in the State probably twenty-five years prior to that date, but records of production are entirely wanting. Four other States — Kentucky, Tennessee, Alabama, and Washington — whose initial reported coal production is given in the census of 1870, were undoubtedly producing coal before that time.

Rivers and Lakes.

In number and magnitude the lakes and rivers of the United States are unsurpassed by any country in the world. The river systems are distinguished by peculiarities of their own, of which the following are the most salient: — The slope of the beds of most of the streams are within that happy medium which insures a steady flow seaward and gives a constant and certain drainage and yet at the same time, while guarding against stagnation, presents no impediment to navigation up stream by reason of too swift a current. The second feature is that the narrowness of the watersheds allows the head waters of rivers, flowing in opposite directions, to lie close to each other, thus presenting but a small portage or distance for land carriage in order to secure navigation or water carriage from one distant point to another, thereby providing the most complete and extensive internal navigation in the world.

The following table shows the drainage basins of the United States, the constituents of the basins, and the distribution of the population among them, according to the census of 1880:

Table IX.—Distribution of Population by Drainage Basins, 1880.

Drainage Basins.	Approximate Area, Square Miles.	Population, 1880.
Atlantic Ocean	2,178,210	48,717,293
New England Coast	61,830	3,788,334

Snake River	103,835	50,997
Clarke's Fork	63,291	16,029

Rivers.

The rivers of the United States may be divided into four classes: — Those emptying into the Gulf of Mexico; those emptying into the Atlantic Ocean; those emptying into the Pacific Ocean; and the rivers of the Great Basin. We will consider these in the order named. Beginning from the West, we have the streams draining the Texas slope of the great plains. These are the Rio Grande, Nueces, San Antonio, Rio Colorado, Brazos, Trinity, and Sabine. The Rio Grande is the only one among these worth special mention. It has a length of 1,500 miles, and, rising in San Luis Park, flows first south between the peaks of the Rocky Mountains, and then, breaking through the range near El Paso, it flows southeast, emptying into the Gulf near Brownsville, forming the boundary between this country and Mexico for a portion of its course. The other rivers mentioned rise generally in

the great Staked Plains, and among the foothills of the Rockies. They are usually of no magnitude, being shallow and having their navigation impeded by shallows and sand bars. Sometimes, however, in rainy seasons they are navigable for greater or less distances.

The next river to claim our attention is the mighty Mississippi. Although the basin of this stream is inferior in extent to that drained by its mighty South American congener, it has, together with its tributaries, a length of navigable waters aggregating over 25,000 miles. The physical characteristics of this river deserve notice. The limit of navigation is reached about 400 miles from its head, where, in the Height of Land at the Falls of St. Anthony, the river is broken by a succession of rapids and cascades with a maximum declivity of sixty-five feet in less than a mile. From this point its course is marked by windings through fertile bottoms, the width of which varies at different points, and which are bounded on both sides by the bluffs created by the erosion of the river. These bluffs diminish in height and recede from the stream as they approach the mouth of the river, until, in the lower portions of its course, the intervening lands are subject to overflow, and must be protected by levees. The water of the stream is not much polluted with earthy matter until the Missouri River is passed, when the stream becomes turbid and muddy, owing to the vast amount of sediment swept from the bed and banks of the Missouri in its swift course to its confluence with the Mississippi. The velocity of the current of the Mississippi varies greatly with the season of the year—in the springtime, when the snow melts in the vast territory drained by it, being a resistless, swift-flowing torrent, and in the summer season, when the water is low, being somewhat sluggish. One singular character of the stream deserves especial mention, and that is its tendency to often change its course. The boundaries between several of the States along its border have been thus materially changed. Sometimes it will take a short cut over a bend instead of following its old course around it, and thus in a few days it may shorten itself by a distance of many miles, and render what before was a part of the main shore an island. Often the land thus torn away contains a large amount of timber, and the trees which are sometimes deposited in the river by the attrition of the soil surrounding them, become the "snags" and "sawyers," which are so dangerous to navigation by steamers. The Mississippi, however great it may be in itself, is not of more importance for any other reason than for the great number of magnificent tributaries which go to make up the vast flood it sends into the Gulf. Many of these streams are navigable to their heads among the mountains of the Cordilleran and Appalachian systems, in which the majority of them rise. From the west the affluents are in succession the Minnesota, which rises in the Coteau des Prairies; the Iowa and the Des Moines, rising between the Missouri and the Mississippi; and the largest tributary of the stream, the Missouri. The Missouri rises in the Rocky Mountains, its headwaters mingling with those of the Columbia, and then flows away over a course of nearly 3,000 miles. Of this distance it is navigable for over two-thirds, or nearly to the Great Falls, which are about 100 miles below the Gate of the Rockies. It receives in its course the waters of many tributaries, among them being the Yellowstone, the two forks of the Platte or Nebraska, and the Kansas or Kaw River, which rises in the alkaline Great Plains. South of the Missouri River the volume of the Mississippi is again augmented by the influx on the western side of the Arkansas and the Red Rivers. The former river rises in the South Park of the Rocky Mountains, and has no commercial importance, being almost unnavigable its entire length. The Red River rises in the great Staked Plains and is navigable above and below a point about 500 miles from its mouth, where it is choked with a vast accumulation of drift-wood called the Great Raft. On the eastern side the Mississippi also receives some important tributaries. The principal of these are the Wisconsin, the Rock, the Illinois, the Ohio, and the Yazoo. The Wisconsin rises near the watershed between the Mississippi and the St. Lawrence system and traverses a region of great fertility. The Rock River rises also in the great lake region, while the Illinois, formed by the junction of the Kankakee and Desplaines Rivers, flows through Illinois and Indiana, thus passing through one of the richest agricultural territories in the world. The Ohio is, next to the Missouri, the largest tributary of the Mississippi. Commercially it is the most important, as annually millions of dollars' worth of freight are borne on its bosom from the northern and eastern country to the southern river country. This stream, together with its tributaries, furnishes over five thousand miles of navigable water. It is formed by the confluence of the Monongahela and Alleghany Rivers, which unite at Pittsburg, and from this point to its mouth, a distance of nearly 1,000 miles, is a navigable stream. It has numerous affluents besides the two mentioned, the principal being the Muskingum, the Scioto, and the Miami from the State of Ohio, the Wabash from Illinois, and the Kentucky, Cumberland, and Tennessee from Kentucky. The Tennessee is in turn the recipient of the Holston and Clinch Rivers, which flow through the great Appalachian valley of east Tennessee. The rivers merging into the Ohio on the south side of that stream to a great extent take their rise either among the Alleghanies proper or their foothills, and on account of the slope of their beds, are most of them obstructed by rapids and falls. To obviate this difficulty numerous dams and locks have been constructed. These flowing into it from the other side, with the exception of the Alleghany and the Wabash, are useful only to supply water to the canals which have been constructed along their course, they being almost unnavigable. By means of these canals the interior of the Ohio basin is in communication with the entire Mississippi and Ohio valleys. Several other rivers may be mentioned as part of the drainage system of the Gulf. These are the Mobile, the product of the union of the Alabama and Tombigbee; and the Appalachicola, which is formed by the Chattahoochee and the Flint. These complete the drainage of the Gulf system; it being, of course, understood that numerous minor streams exist here, of which no mention is made.

We will now consider the Atlantic drainage system. The streams which compose this system take their rise either in the eastern side of the main chain of the Appalachians or in the foothills of the range. In their initial course they are usually shallow and rapid, but when they reach the lower lands of the coast their character changes and they become broad and sluggish, and are generally navigable and subject to influences of tides. Beginning at the southern extremity of the continent, and going north, the most important rivers are the St. John's in Florida; the Altamaha, formed by the confluence of the Oconee and Ocmulgee; the Savannah; the Santee, formed by the Congaree and Wateree; the Great and Little Pedee, Cape Fear, Neuse, and Roanoke. These are generally of a sluggish character, and their banks are heavily timbered with almost all kinds of swamp forest, while the country they drain usually has a heavy growth of yellow pine and other trees. In Virginia we have the James, rising in the Appalachians, and flowing past Richmond (the head of tide water and of navigation) it empties into the Chesapeake Bay. North of this is the York, formed by the Mattapony and Pamunky. Next comes the Rappahannock and then the Potomac. The most northern affluent of Chesapeake Bay is the Susquehanna, which, rising in New York, traverses a portion of that State and then through Pennsylvania to its mouth. The Delaware River rises in the Catskills and, flowing through New York and washing Delaware, finds its entrance into the sea though the bay of the same name. Next comes the beautiful Hudson, which

Atlantic drainage.

rises in the Adirondacks and, after a course whose natural beauty is unexcelled anywhere in the world, empties into Long Island Sound at New York city. This stream is navigable to Troy, a distance of 150 miles from its mouth, and from this point it is connected by canal with the St. Lawrence system; thus giving uninterrupted water communication between New York city and Chicago and remote Canadian localities. East of the Hudson is the Connecticut, draining the beautiful valley of the same name; next come the Merrimac, the Kennebec and the Penobscot. We now come to the great St. Lawrence system. This comprises the five Great Lakes, the most magnificent lacustrine aggregation in the world, and approached by no similar natural features anywhere on earth, unless it may possibly be that of Central Africa —as yet unsurveyed and undelineated. The rivers of this plexus are insignificant, so that any consideration of the Laurentian system entails the discussion of the Great Lakes.' For commercial purposes these lakes are as valuable to the people of the United States as are the eastern and western coasts. They afford navigation for the largest vessels, and their shores are dotted with large cities, between which an immense amount of traffic is carried on. The length of their coast line within the United States is over 3,000 miles, and by means of the different canals which have been constructed, joining them, a vessel can sail from Duluth to London, England, without trouble. This practically gives the United States 3,000 miles additional sea coast. In addition to the five Great Lakes, lakes Champlain, George, and the lakes of central New York, besides Winnebago Lake in Wisconsin, are tributaries of the St. Lawrence system.

Pacific drainage.

Of the river systems of the Union there yet remains to be considered that of the Pacific. The Columbia, a mighty stream, is formed by the confluence of Lewis River with Clarke River (or forks, as they are both called). Its principal tributary, the Willamette, flows through the fertile valley of the same name, lying between the Coast and Cascade ranges. The Sacramento River rises in the Great Basin, and, after a course through a fertile country, empties into the bay of San Francisco. On its way it receives several tributaries from the Sierra Nevada. The San Joaquin also flows into the bay of San Francisco. It rises in the Sierra Nevada, from which it also receives several tributaries. The Colorado River rises in the Wind River Mountains, where it takes the name of the Green River, and, after a course of 300 miles through one of the most remarkable gorges or cañons in the world, empties into the Gulf of California, 150 miles from its point of emergences from the cañon. The walls of the cañon are in some places 6,000 feet in depth. Along its course it receives as tributaries the Grand, Little Colorado, and the Gila Rivers, all of which take their rise in the Rockies. Besides the rivers mentioned before, the Red River of the North flows for a portion of its course through the United States. It rises in Elbow Lake, in Minnesota, and flows northwesterly into Lake Winnipeg. A peculiarity of this stream is the large number of lakes that are tributary to it and occur in the first one hundred miles of its course.

A remarkable feature of the two great systems of the Mississippi and the St. Lawrence is the contiguity of their head water, Lake St. Louis, the head of the latter river being but a short distance from Lake Itasca, the source of the former.

There is in the Great Basin of the Rockies, a river and lake system peculiar to that region. The rivers have no outlet to the ocean, and find their termination in a lake, or, as in one or two instances, lose themselves in the earth. Reese River and Humboldt River are the principal rivers of this region, both of them emptying their waters into Humboldt Lake.

Among the lakes the most remarkable is the Great Salt Lake, in Utah, the counterpart of the Dead Sea. This body of water is seventy miles long and thirty miles wide. Its waters are extremely salty. It receives the waters of the Jordan, and several other small rivers and creeks. The Jordan connects it with Lake Utah, a considerable body of fresh water. Bear Lake and Lake Sevier may also be mentioned as forming a portion of this system.

Climatic Conditions.

The United States may be said to include three grand climatic divisions, distinct and well-marked in their characteristics. The larger of these by far is that which extends from the Atlantic coast to the foothills of the Rocky Mountains, and embraces three-fifths of the entire country. The second division includes the Cordilleran Mountains and their elevated plateau; and the third, differing in many essentials from both the others, includes the narrow strip between the Sierra Nevada and Cascade Mountains and the Pacific coast.

In the first or eastern division, the lines of equal mean temperature run approximately east and west, and preserve a certain amount of regularity. The isothermals are deflected in passing over the Cordilleran range, and vary greatly with the altitude, extent, and even with the trend of the mountain ranges. In the third or Pacific division the isotherms tend to parallelism with the direction of the coast, but their character is greatly modified by the position of the two parallel ranges, the Coast Mountains and the Sierra Nevadas, and by the warm Japan current on the one hand and the cold Arctic current on the other.

Treating first of the grand central division, its fifteen degrees of latitude are included between the annual isothermals of 44° and 68°, a total range of 24°; or an average of 1.6° difference of temperature for each degree of latitude. The transition from one type of climate to the other, although rapid, is uniform. The difference of mean annual temperature between the Atlantic coast of the United States and that of Europe is much greater in the higher latitudes than in the lower ones. New York, in latitude 40° 42′, has a mean annual temperature 10.6° lower than Naples, in latitude 40° 48′. But Norfolk, Va., almost in the same latitude as San Fernando, Spain, has a mean annual temperature only 4.3° lower than the Spanish city. About latitude 30°, the latitude of St. Augustine, Fla., and New Orleans, in the United States, and in Africa of southern Morocco, the two sides have nearly the same mean temperature, although, owing to the great differences in the amount of precipitation, the unlikeness of climate is very great. In passing south from the Canada line along the Atlantic seaboard, there is a rapid increase of temperature, due to the warm currents from the Gulf of Mexico, and to the prevalence of southwesterly winds.

At the north, places in the same latitude on the Atlantic and Pacific coasts have approximately the same temperature, but the southern Atlantic regions are decidedly warmer than their parallels on the western coast. The vast body of water contained in the Gulf of Mexico has, of course, a considerable effect upon the peninsular projection of Florida, and this State, which extends south to 25°, has a higher mean temperature than any other part of the country. The extreme south end of Florida has a mean of over 72°, and over the whole of the State and along the Gulf into Texas the annual mean exceeds 68°.

Isothermals.— The range of the isothermals is as follows:—That of 40° passes through central Maine, northern New Hampshire and Vermont into Canada, thence re-enters the United States at the west end of Lake Superior, passes through central Minnesota, thence trends south in eastern Dakota, and thence northwesterly until it crosses the boundary line in 107° west longitude. Between the isothermals of 44° and 52° lie New England, New York, all the Middle States, nearly all Michigan, southern Wisconsin, southern Minnesota, nearly all Nebraska and South Dakota. West of the Appalachians the isothermal of 52° follows the Ohio River to Cincinnati, passes in an undulatory westerly direction through Indiana, Illinois, northern Missouri and northern Kansas to

Colorado. As it nears the Rocky Mountains it turns abruptly south a distance of more than four hundred miles. The isothermal of 60° runs parallel with that of 64°, but is deflected to the south between the meridians of 83° and 87°. The isothermal of 64° leaves the Atlantic on the boundary of North and South Carolina, and runs on the line of 34° latitude, almost due west of the 100th parallel, where it, like all the other isothermals, is deflected southward by the mountains. Within this central region, which extends from northern Dakota to New Orleans, there is a vast range of temperature. At Fort Sully, in latitude 44° 39′, the mean yearly extremes are — 25.2° and 108.7°; at New Orleans, in latitude 30°, they are 23.2° and 96.2°, respectively. The isothermals for the summer months are much more irregular than those for the year. This is principally caused by the southerly winds from the heated waters of the Gulf of Mexico, which blow unchecked over the whole central plain and divert the summer isothermals to the northwest in a surprising manner. That of 72° has been known in July and August to reach latitude 45° in northern Dakota. Florida, the Gulf States and greater part of Texas have a mean summer temperature of over 80°, while the country from Tennessee and Georgia north to the Great Lakes and west into Iowa, Kansas, and Nebraska lies between the summer isothermals of 68° and 76°. As the most practical method of furnishing information in regard to the temperature and rainfall of the United States, the following carefully prepared table is given. It shows:

First, the mean average rainfall (M. A. R.).
Second, the mean average temperature (M. A. T.).
Third, the highest recorded temperature (H. R. T.).
Fourth, the lowest recorded temperature (L. R. T.).

TABLE X.—TEMPERATURE AND RAINFALL.

STATIONS.	M. A. R.	M. A. T.	H. R. T.	L. R. T.

Wisconsin, Milwaukee	32.1	45.0	100	'25
Wyoming, Cheyenne	12.2	44.4	100	'38

' Indicates temperature below zero.

Thus it may be said with truth that near the Pacific coast we have a difference of only 12° in mean temperature in a range of over sixteen degrees of latitude. From the immediate vicinity of the coast, in latitude 35°, into the San Joaquin and Sacramento valleys, the mean temperature is not below 60°, and nowhere much higher. The causes of this are the proximity of the great area of water over which the prevailing winds blow, the modification which the temperature of this ocean undergoes near the American coast by the Asiatic coast current and the northern or Arctic coast current, and the position of the mountain ranges near the coast. Uniformity of climate along the edges of the land is still further aided by the peculiar nature of the currents along this coast. The influence of the warm Asiatic current — the Kuro-Siwo — is distinctly felt in raising the temperature as far south as the northern part of California.

Meteorology.—Peculiar meteorological conditions exist in the United States, producing in the winter intense cold and in the summer extreme heat, while occasionally, especially in the West, great variations of temperature are noticed within a very brief space. What are known as "cold waves" generally proceed from the valley of the Saskatchewan and the prairies of Manitoba. The north wind sweeps over Wyoming and Colorado, Minnesota and Wisconsin and sometimes reaches as far south as Kentucky and Tennessee. A strong breeze, sometimes blowing with a velocity of thirty to forty miles an hour, carries with it the icy blast of the frozen North, and causes a fall in temperature of twenty, thirty, even forty degrees in a single day or night. The effect of these cold waves has even been felt in Florida, where a few years ago the orange groves suffered severely. But on the exposed prairies of Iowa and Nebraska the full force of the wind is experienced, and the loss of stock, and sometimes of human life, is great. These "cold waves" are seldom of long duration. In the Rocky Mountains and the foothills there is often a fall of 40° in one day, sometimes in a few hours.

Hot waves.

The "hot wave" usually occurs in July and often extends over large tracts from the seaboard to Dakota or Colorado. This affliction, happily, is usually of brief duration, seldom lasting more than three or four days, although spells of hot weather may follow each other with brief intervals of lower temperature. In such cases the thermometer may record 90° to even 100° F., not only in the Middle and Southern States, but as far north as Yankton. Little is known of the cause of these phenomenal heated terms, but they are most severe in the inland districts, where there are no mountains to induce precipitation, and neither sea nor lake breezes modify the torrid heat.

The prevailing winds in the entire Atlantic and central region are westerly the year round. In winter they are chiefly northwesterly; in summer, southwesterly. Between the Alleghanies and the Mississippi, and from the lakes, south to the Cumberland Mountains, southwesterly and westerly winds prevail the year through. In the extreme southwest, the summer winds are mostly southerly, those of the winter mostly north and northwest. On the Pacific coast the winds are mostly westerly, especially in summer. California has very strong winds from the northwest in summer, and from the southwest in winter. San Francisco enjoys an evening sea-breeze, which renders it one of the most desirable of residential cities. The Atlantic seaboard, as far inland as the Appalachians, is equally favored; while in the interior the Great Lakes temper the summer heat, and modify the winter's cold.

Rainfall.—The rainfall of the United States may be defined as divided into two sections by the 100th parallel of longitude. East of that parallel it is generally ample and sufficiently well distributed; west of it (except on the Pacific coast-belt) the supply is insufficient and irregular. The region of greatest precipitation is that of the Atlantic coast and the Gulf of Mexico. In the north and east there is at least thirty-two and sometimes as much as forty-four inches of rain per annum.

Farther south along the coast the precipitation may equal fifty inches and from South Carolina and Tennessee to the Gulf of Mexico it ranges from forty-eight to fifty-four inches. Florida counts, as a rule, on a precipitation of fifty-six inches in its southern division. Nowhere in the United States does an amount of rain fall to equal the precipitation of the Scotch islands or of Ireland. It must be remembered that regions in which anything less than twenty inches of rain falls in the year can only be utilized for pastoral purposes, and that where the amount is much below this they cannot be cultivated at all except by irrigation. Where the precipitation averages above twenty inches, but does not exceed twenty-five inches, cereal cultivation is possible, and in certain years good crops may be grown. But, unless the average is fully maintained and the precipitation occurs at the proper times, there will be in such districts total or partial failure of crops, sometimes for several years in succession, for droughts, like heated terms and terms of extreme cold, appear to run in cycles.

Consultation of a carefully prepared rainfall chart will show that the entire eastern division of the United States is well supplied with rain. An isohyetal of twenty-six inches may be considered as forming the dividing line between a sufficiently and an insufficiently watered area. This isohyetal enters the United States from the north to the northwest of Lake Superior and runs southwesterly to the 97th meridian, which it strikes in the latitude of 45°. Thence, from about St. Paul, Minn., it runs south with a slight westward inclination until it enters Texas on the 99th meridian. On this line it continues through four degrees of latitude, until that of 31° is reached, when the isohyetal again advances about four degrees to the westward, and thence runs southeast to the Gulf of Mexico, at the mouth of the Rio Grande. To the east of this line therefore are all the Atlantic and Middle States and all those east of the Mississippi River. Included also in this moister region is the greater part of Minnesota, eastern Nebraska, eastern Kansas, the Indian Territory, including Oklahoma, and the eastern half of Texas. The isohyetal curve of thirty-two inches, or that marking the line of abundant precipitation, runs generally parallel to that of twenty-six inches, and not more than three degrees of longitude to the east of it. In other words, everything east of a line drawn from the southern line of Lake Superior to the Gulf on the meridian of 94° is included in the district whose average rainfall ranges between twenty-six and thirty-two inches per annum, or exceeds that amount. Almost all of Minnesota lies within these lines, but a small part of eastern Wisconsin, and of eastern Michigan, receive less than their full share of the precipitation.

Eastern division.

The heaviest rainfall in the United States occurs in the country bordering on the Gulf of Mexico and on the southern Atlantic coast. Along the Gulf, between longitude 85° and 92°, the annual fall exceeds 56 inches, and the isohyetal of 56 takes in parts of Georgia, Arkansas, Tennessee, and South Carolina. Southern Florida has 54 to 56 inches, and eastern North Carolina 50 inches. The isohyetal of 44 inches runs nearly parallel to the coast, and at no great distance from it, as far south as latitude 37°, when it trends to the west. The greater part of the eastern division of the United States thus has an average precipitation of from 32 to 44 inches, while small areas in several States receive more. This rainfall is distributed pretty uniformly throughout the year along the Atlantic coast, in the valley of the Ohio and along the Mississippi and in the Hudson River valley. In the sea-coast region, from Massachusetts to Maryland, the maximum fall occurs in May, August, and December, while in the Hudson valley the maxima occur in July and October, and February is the dryest month. In the Ohio River valley the maximum fall is in June, the minimum in February. In the lower Mississippi valley the maximum and minimum occur in December and October, respectively. Along the Gulf coast the principal fall is in July, the secondary maximum in December, while October and April are the dryest months. Along the upper Mississippi the greatest precipitation occurs in summer, much to the advantage of the crops, and the winter is a season of drought. The same is true as to the Hudson valley, and from that westward except that the range is greatest in Minnesota and Wisconsin.

Gulf division.

The conditions of the rainfall on the Pacific slope are peculiar and varied. Along the coast of California, and in the interior of that State, and on the western slope of the Sierra Nevada the maximum precipitation occurs in December and scarcely any rain falls in the summer months. The mean annual fall at San Diego is less than ten inches; that at San Francisco twenty-two inches. But in the north, around Puget Sound, there is an annual fall of over seventy inches. In the north, also, there is a great increase in the amount of the summer precipitation, which, in northeast Washington, amounts to ten or twelve inches in the three summer months. In San Francisco the largest annual rainfall recorded in twenty-five years was thirty-six inches; the lowest twelve inches. In the mountain country the precipitation takes the form of snow, and we know very little about its amount, though it is believed to be but small. But the precipitation is decidedly higher on the mountain ranges than in the valleys.

Pacific division.

Elsewhere, under the appropriate headings (see METEOROLOGY, Vol. XVI, p. 134, and ATMOSPHERE, Vol. III, p. 31), we have treated of the abnormal disturbances of the atmosphere, which produce cyclonic storms. With regard to ordinary storms of wind accompanied by rain, the United States is not particularly subject to these. On the Atlantic coast ocean-born storms occur, and, especially in the winter season, blow with considerable velocity, and cause damage to shipping. This is characteristic, however, of all seaboard countries, and calls for no special notice. Throughout the central and eastern regions the ordinary storms are of simple character and practically of uniform origin and development. They begin with the formation of areas of low barometer in the extreme west, or more often in the southwest, and move east or northeast with a velocity of from twenty-five to thirty miles per hour. Their rate of speed varies with the season, being greatest in January and February and least in August. If these storms arise in the northwest they move in a direction somewhat south of east; if they originate in the southwest they travel practically northeast. The progress of these storms is marked by heavy rainfall, usually extending over a wide area. Often there are noticed independent rain centers within the storm area.

Cyclones.— The tornadoes or cyclones, for it is difficult to discriminate scientifically between the two forms, are not strictly confined to any one season, but are most frequent in summer and least so in January and December. They most often occur between four and six o'clock P. M., and their generation is coincident with a disturbance of the barometric conditions, and with great contrasts of temperature in subjacent areas. Five-sixths of the recorded destructive tornadoes moved from southwest to northeast, and the whirling motion of the storm vortex is invariably from right to left. The width of a tornado may be less than fifty feet, and has been known to exceed a mile. The velocity of progression of the main storm cloud may vary from twenty to sixty miles an hour, the average being thirty miles. The velocity within the storm vortex defies estimation or measurement, but has been variously guessed at from 70 to 500 miles an hour. The prairie country, especially when far removed from bodies of water, is much the most subject to destructive tornadoes. It has been an article of faith that tornadoes never strike near streams or lakes, but the experience of Louisville, in the spring of 1890, has shattered this belief.

VEGETATION.

No country upon earth includes such a variety of forest and field production as the United States.

From the rye and barley of the northern temperate zone to the corn and cotton of the southern temperate regions, and the oranges, pineapples, and bananas, the palmettos and the magnolias of Florida, the luxuriant vegetation of this favored country knows neither scope nor limit. Of timber trees the range is from the pine-clad forests of Maine to the cedars and cypresses of the south, while the Pacific coast contributes the *Sequoia Gigantea* and its magnificent eucalypti, and every species of deciduous and coniferous tree abounds. Except on the topmost heights of the Cordilleras and on isolated peaks of the northeastern range, forest trees of great value clothe the summits. The great prairie country of the central region makes up by the luxuriance of its cereal and root products for the comparative absence of forest vegetation.

Considered botanically, the flora of the United States is very rich in woody plants. The actual number of species is not known, but 800 is perhaps not too high an estimate. There is no dividing line in nature between trees and shrubs; the arbitrary rule adopted by most botanists is to call *trees* only such species as grow to 30 or more feet high; less than that are *shrubs*. Sometimes, however, the habit of the plant will place among the trees a plant which from size alone would be called a shrub. An examination of various authorities shows that upward of 300 indigenous species of trees are known to botanists, growing within the limits of the United States, which attain the height of 30 feet. About 250 of these are somewhere in the United States tolerably abundant, or at least not rare.

Number of species.

If we exclude all the smaller trees that never attain a height of 50 feet, also those tropical species, however large, which occur with us only in extreme southern Florida, also a few Mexican trees found only along our extreme southern border, also such rare species as may occur only in Alaska, also all those very rare species nowhere common, and consider only the larger trees which are somewhere in our territory tolerably abundant, we have still about 120 species, of which about 20 attain a height of 100 feet, 12 a height of 200 feet, while perhaps five or six may attain a height of 300 feet and over. Of the 120 species indicated, about 50 belong to the *Coniferæ*. How many of these species are of special importance in commerce, or in the home industries (of other use than fuel) it is impossible to say, but, it is a very large proportion of the whole number. Many of the smaller species, however, and of the larger shrubs, give special character to large areas of woodlands and cannot be ignored in any discussion of American trees whether considered botanically or economically.

It is impossible to cross the continent, from the Pacific to the Gulf of Mexico, without passing through a forest five miles in extent. Then, again, the woodlands of the east are separated from those of the west by a broad treeless plain, from six to fifteen degrees wide. The forests and woodlands on the two sides of this gap are entirely unlike in their aspect and in their botanic characters. On the eastern side broad-leaved, hardwood species predominate, both in abundance of individuals and in number of species, the forest of large areas consisting entirely of such kinds. On the west, the forests are entirely of *Coniferæ*, other species occur, some of great value, but they nowhere (or at most in only rare cases in the extreme west) form a conspicuous or even noticeable element in the forests. Not a single species forms a noticeable element in the forests of both sides; the nearest approach to it is the aspen (*Populus tremuloides*) which is a common tree, in the north from the Atlantic to the Pacific. Two species of cottonwood are also abundant in some localities and form an important element in the fringe of wood bordering streams, but are never otherwise a conspicuous element in the forests of the west. These three species of poplar are the only broad-leaved trees that figure as trees on both sides of the central treeless plains; but others stray across as mere shrubs on one side. Among the *Coniferæ* one cedar is found on both sides as an abundant wood in places, but it is a low crabbed growth west, a large shrub oftener than a tree. Neither beech, nor elm, nor hickory, nor mulberry, nor basswood, nor tulip-tree, nor magnolia, nor sassafras forms an element in the forests of the Rocky Mountains and westward.

Treeless plain.

New England was originally entirely wooded, and has about 80 species of trees of which about 60 may reach 50 feet in height The Middle States have from 100 to 105 species of trees, about 65 of which sometimes reach 50 feet in height. This region was also entirely wooded originally. The southeastern region, extending from Virginia to Florida, is the richest in species, and of first-class importance in commerce. This region, likewise originally entirely wooded, has upward of 130 species of trees, 75 of which attain a height of 50 or more feet, and perhaps a dozen species attain a height of 100 feet. The northwestern region, extending from Ohio to Iowa and Minnesota, had originally every variety of forest feature represented. It has from 105 to 110 species, about 70 of which may reach a height of 50 feet. The southwestern region extending from Kentucky and Missouri to Alabama and the western edge of the timber in Texas, has from 112 to 118 species, 60 to 65 of which attain a height of 50 feet. Details of these and of other regions follow.

Beginning with the northern mountain system, we find the Adirondacks densely wooded to their summits. The portion of the United States first settled by the English was, without exception, a densely-forested region, mostly of hard-wood trees. Among these, the sugar maple (*Acer saccharinum*) is of the greatest economical importance in New England, but ranges as far west as the Great Lakes, and south to Alabama. In the higher portions of the country, and around the lakes, large areas are occupied by the bird s-eye maple, of great value for making furniture. The soft and red maple, of less importance economically, have even a wider range. The oaks are spread in countless variety of species over the whole seaboard forest region, from Maine to Florida, and west as far as arboreal vegetation extends. The white oak (*Q. Alba*) reaches its greatest development along the western portion of the Appalachians, and in the valley of the Ohio and its tributaries. The burr oak has almost as wide a range as the white oak, extending far to the west and northwest, and forms with the scarlet oak the principal growth of the prairie "oak openings." The red oak (*Q. rubra*) has a wide range to the north. The live oak (*Q. virens*) is an evergreen tree of great value, widely distributed along the Gulf coast, and extending into Texas and Mexico. The chestnut oak, the bark of which is of great value for tanning, is found from northern New York to the Alabama line, and abounds in Tennessee and Kentucky. Of ash there are many species. The white ash ranges east and west, from Maine to Minnesota, and southwest to Texas, and finds its highest development in the bottom lands of the lower Ohio valley. The range of the red ash is almost as wide as that of the white, except in the northwest, where the places of both are taken by the green ash.

The chestnut, including many varieties, extends from Maine to Alabama, and grows luxuriantly on the North Carolina mountains. Birch flourishes in New England and all along the coast to Alabama, and is found west as far as Minnesota. The hickory, the butternut, the black walnut and the American elm are widely distributed and have considerable economic importance. South of Indiana is found the pecan-tree, and from New Jersey to North Carolina the tulip-tree flourishes. Space would fail to tell of the magnolias, acacias, laurels and the varieties of locusts which form adornments to the landscape.

Coniferous trees are widely spread over the whole country, from Maine to southern Georgia, and of these the genus *Pinus* is at once the most valuable and the widest distributed. The chief is the white pine (*P. strobus*), which attains its maximum development in Maine and Michigan, and grows to a greater height than any other species of the eastern forest

region. The most important pineries of the Eastern States are in Maine, where this species occurs, scattered through the deciduous forests, and where the most easily accessible trees of large size have already been pretty well thinned out; Michigan and Wisconsin are the chief pine-producing States of the western and northwestern region. Saginaw Bay, on Lake Huron, may perhaps be designated as the headquarters of the northwestern pine lumber industry. The somewhat less valuable southern pine (*P. palustris*), called also hard, yellow, long-leaved, and Georgia pine, is, in contrast with the white pine, decidedly a southern species, ranging from southern Virginia south to Florida, and southwest through the Gulf States to the valley of the Red River in Louisiana and that of the Trinity in Texas. It occurs over extensive areas, forming the "pine-barrens" of Georgia and the Carolinas. The wood is hard and tough and the tree furnishes immense quantities of tar, pitch, rosin, and turpentine. The yellow pine (*P. mitis*) has a range from Connecticut to Florida and through the Gulf States to Texas.

Another important conifer, next to *Pinus palustris*, the most characteristic tree of the southeastern coast timber belt, is the cypress (*Taxodium distichum*), which ranges from Delaware south along the coast to Florida, and southwest to Texas, forming extensive forests in the southern Atlantic and Gulf States, and also extending up the Mississippi to southern Illinois. The cypress is a marked feature in the swamp country which extends along the coast from Virginia through North and South Carolina, of which the Great Dismal Swamp, on the borders of Virginia and North Carolina, may be taken as the type. These swamps are locally known through the region where they occur as "dismals" or "pocosins." The largest continuous area of swamp in North Carolina lies between Albemarle and Pamlico Sounds, covering an area of nearly 3,000 square miles. The prevalent growth of the best swamp lands is the black gum (*Nyssa sylvatica*), tulip-tree or poplar, cypress, ash, and maple, the proportion of cypress increasing as the soil becomes more peaty. These so-called swamps — in large part at least — differ essentially from what is usually called a swamp, being considerably elevated above the adjacent streams; they are, in fact, immense accumulations of decaying vegetation, often peaty in character with more or less fine sand intermingled, and with a very considerable variety of forest vegetation. Portions of these swampy areas have been successfully drained and brought under cultivation; other portions have resisted all attempts of the kind, although there has been a large amount of money expended in endeavoring to reclaim them. Besides the pines, there are to be mentioned here the spruces, firs, larches, and cedars, which together form a marked zone of vegetation decidedly northern in character, extending through the northern part of New England, through Canada to the Upper Lakes, and far to the north and northwest, where it unites with the forest belt of the Rocky Mountains, in almost the extreme northerly extension of this range within the United States. The northern forms of coniferous trees also occur in the highest portion of the Appalachians as far south as North Carolina, and are found along the most elevated ridges of the Rocky Mountain range, from the extreme north through to Arizona and New Mexico, and along the culminating portion of the Sierra Nevada nearly to the southern border of California.

A characteristic type of northern coniferous trees is the balsam-fir, which extends from Maine west to the base of the Rocky Mountains, and produces what is known as "Canada balsam." Spruce and hemlock are characteristic northern trees. The bark of the latter furnishes material for tanning. The larch, or tamarack, and the white cedar are widely spread, and in the prairie country the cottonwood and the willow grow along the water courses.

The flora of California and the Cordilleran region differ considerably from that of the Atlantic and Middle States, although including many species in common.

The forests found in the western portions of the United States are unrivalled in all the world. Nowhere else do they attain so enormous a size, or, space considered, are so numerous. Speaking from an æsthetic standpoint, it is impossible to describe the magnificent grandeur of the forest effects. Travellers from the four corners of the earth visit the stately aisles and are without words to convey the impression left upon them. Here, indeed, are found what may be worthily termed "God's first temples." Looked upon from a utilitarian standpoint, the effect, though different, is not less impressive when the beholder considers the infinite resources for man's need here conserved.

Dense forests clothe the western slopes of the Sierra Madra Mountains throughout their entire length. In Washington and Oregon particularly, the fir and pine-trees are of largest growth and seemingly inexhaustible in number. To-day the lumber business of the great Northwest is the largest and most important of the region. Laying adjacent to Puget Sound, transportation is comparatively a simple matter, thus facilitating the business. There are in this region two varieties of trees that are chiefly used for lumber, the Douglas fir (*Pseudotsuga Douglasii*), and yellow pine (*pinus ponderosa*). The latter grows farther inland, being found on the eastern slopes of the Sierra Nevada, covering the Cascades, and occasionally occurring in the Rocky Mountains, growing all the way from British Columbia to Arizona.

No description of the trees of this region is complete without mention of the famous redwood, the largest of all plant growths. There are two varieties, which are found only in California, generally not far distant from the coast. A vivid description of their phenomenal size and beauty is given by the famous traveller and lecturer, John L. Stoddard, who says:

The big trees.

"Who has not heard of the 'Big Trees' of California? They are another proof of the fact that the western portion of our country is a region marvelously endowed by Nature. There are in the area here which has been set aside by Congress 'for public use, resort and recreation,' more than 600 trees, which have in respect to size no rivals in the world. A stage-coach, with driver, passengers and horses, can be driven through the upright hollow trunk of one of these forest giants, which nevertheless is still sufficiently alive to bear leaves on its branches 300 *feet above the ground!* Even more enormous than those still flourishing here are some prostrate monsters, one of which must have had a circumference of 120 feet and a height of 400! The largest tree now standing here has a circumference of about 100 feet and its first branch (six feet in diameter) is 200 feet from the ground! It is an extraordinary fact that the cones of these trees are no larger than walnuts, and their seeds are only about a quarter of an inch in length. One feels himself a pigmy as he stands beside these forest Titans, not only in comparison with their prodigious size, but as he measures his brief life with the long line of thirteen centuries, of whose slow march their annual rings and weird colossal limbs give proof."

In the Rocky Mountains are comparatively few forests. What there are, are scattered here and there in small groves. As might be expected, they flourish best at the base of the mountains where there is the greatest amount of moisture. There is no comparison between the forests of the Sierra Madra and Cascade ranges and those of the Rockies, the former far outshadowing the latter. The tree most commonly found is the aspen, more popularly called the cottonwood. This tree is found growing over a greater extent of territory than any other in North America. It is at home in cold and bleak Newfoundland as well as in the equally barren but torrid regions of Arizona and New Mexico. Other trees of the Rocky Mountains are the scrub oak, white oak, and black oak.

It only remains to speak of the vast central prairies which extend over so large a portion of the area of

the United States, and which, but for the cottonwoods and dwarfed oaks along the water-courses, were originally practically treeless. Large areas in the more southern States — Arkansas, Alabama, Mississippi, and Louisiana — are also prairies, portions of which are entirely destitute of forests, while others have small "clumps" of trees sparsely scattered over their surface. This is in a region of the largest rainfall, that of fifty-six inches and upward. The cause of the absence of trees on the prairies is the physical character of the soil, and especially its exceeding fineness, which is prejudicial to the growth of anything but a superficial vegetation, the smallness of the particles of soil being an insuperable barrier to the necessary access of air to the roots of a deeply rooted vegetation. Wherever in the midst of the extraordinarily fine soil of the prairies coarse or gravelly patches exist, there dense forests occur.

Central prairies.

Since the settlement of the great States west and northwest of Ohio a vast change has been wrought in this region. Especially of recent years the necessity of supplementing nature by art and of planting groves of useful timber has been brought to the mind of the agriculturist. The value of timber as a shelter and as inducing and regulating rainfall is well known. States and counties have by publication and legislation, and by the grant of lands conditioned on the planting of timber, encouraged such action and with the most gratifying results. In States like Illinois, Iowa, and Nebraska hundreds of thousands of acres have been planted with timber, and so far as they are concerned the treeless prairie is a thing of the past. In some of these States a day is annually set apart for the planting of timber, and is known as "Arbor Day."

The United States occupies a favored position among the nations in the variety and abundance of the products of the field. Every cereal of the temperate zone, the rice and cotton of the tropics, the potato and the yam, the sugar cane and the tobacco plant all flourish luxuriantly in the various divisions of the country. The apple, pear, and plum, and the hardier fruits of the north, are supplemented by the orange and the banana of Florida, and the olive, peach, and fig of California, while the vine extends over thousands of miles of territory. The native and cultivated grasses furnish sustenance for millions of cattle, horses, and sheep, while root crops are grown in every part of the country.

Field products.

The northern tier of States, from the Atlantic inland to the Great Lakes, supplies the hardier cereals in great perfection. Rye, oats, and barley thrive in New York and the Eastern States; wheat constitutes a most valuable crop from the Canada line south to the Ohio River. But it is on the virgin prairies of Minnesota and the Dakotas that the great wheat fields of the world are to be found. Soil and climate combine to produce the chief cereal in a quantity and of a quality unsurpassable anywhere. Modern improvements in agricultural machinery enable wheat-farming to be carried on upon a gigantic scale and at a low cost, while the development of the railroad system and the facilities offered by the Great Lakes afford access to the markets of the world.

In the States to the south of this section "corn is king." This invaluable food-plant, indigenous to the American continent, flourishes with the utmost luxuriance in the fertile river-bottoms of Illinois and Indiana, and on the spreading prairies of Iowa, Nebraska, and Kansas. Missouri, too, grows an immense acreage of corn, and all through the Mississippi and Gulf States a full supply for home necessities is grown. South Carolina and the Gulf States produce the best rice in the world, and side by side with this grows the cotton, which forms the chief staple of the south. Virginia, Tennessee, and Kentucky are the leading producers of tobacco, although this is grown to a greater or less extent in many other States, and even as far north as the valley of the Connecticut. Sub-tropical Florida has a fauna of her own, and here oranges and lemons, bananas, pineapples, and other fruits of the southern temperate and neo-tropical zones flourish. Owing to the improvements in the means of communication these products of bountiful nature can be placed in the markets of the North and West within forty-eight hours, and certainly there is no country in which the vegetable productions of so vast a region can be found grouped at any central market.

California, in addition to the wheat and barley which rival those of all countries, has developed of late years a capacity as a fruit-growing region, which has become the foundation of an enormous industry. The cultivation of the vine on the Pacific slope is being carried on intelligently and with great vigor, while fruit farms have been established by the thousand.

Irrigation.— No review of the vegetation of the United States would be complete without a notice of the development of the great irrigation systems by which vast tracts of unproductive land have been reclaimed and made to bear their share in the economy of agricultural thrift. Notwithstanding all that has been accomplished by private ownership and State and county authorities, the results indicate that an enormous public benefit would be attained by a thorough system projected and carried out by the national government, under an adequate appropriation. The general irrigation statistics of the United States, exclusive of all rice-producing States, excepting Texas, and of Indian reservations, are presented in the following tables:

TABLE XI.— GENERAL IRRIGATION STATISTICS, 1889.

REGIONS.	Number of Irrigators.	Acreage Irrigated.
The United States	54,136	3,631,381
Arid States	52,584	3,564,416
Semi-arid States	1,552	66,965

TABLE XII.— IRRIGATION IN ARID STATES, ETC.

STATES AND TERRITORIES.	Number of Irrigators.	Acreage Irrigated.
Total.	52,584	3,564,416
Arizona	1,075	65,821
California	13,752	1,004,283
Colorado	9,659	890,735
Idaho	4,323	217,005
Montana	3,706	350,582
Nevada	1,167	224,403
New Mexico	3,085	91,715
Oregon	3,150	177,944
Utah	9,724	263,473
Washington	1,016	48,799
Wyoming	1,917	229,676

TABLE XIII.— IRRIGATION IN SEMI-ARID STATES, ETC.

STATES AND TERRITORIES.	Number of Irrigators.	Acreage Irrigated.
Total	1,552	66,965
Kansas	519	20,818
Nebraska	214	11,744
North Dakota	7	445
South Dakota	189	15,717
Texas	623	18,241

In 1889 the cost of the producing irrigation systems was $29,000,611.

MINERALOGY.

The following table presents a summary of the mineral productions of the United States in the calendar year 1889:

TABLE XIV.—MINERAL PRODUCTS OF THE UNITED STATES, 1889.

PRODUCTS.	Quantity.	Values.
Total	.....	$587,230,662
Total value of metallic products	.....	269,590,487
Total value of nonmetallic mineral products	.....	307,640,175
Total value of mineral products, unspecified	.....	10,000,000
METALLIC.		
Pig iron, value at Philadelphia, long tons	7,603,642	120,000,000
Silver, coining value, troy ounces	51,354,851	66,396,988
Gold, coining value, troy ounces	1,590,869	32,886,744
Copper, value at New York city, pounds	231,246,214	26,907,809
Lead, value at New York city, short tons	182,967	16,137,689
Zinc, value at New York city, short tons	58,860	5,791,824
Quicksilver, value at San Francisco, flasks	26,484	1,190,500
Nickel, value at Philadelphia, pounds	252,663	151,598
Aluminum, value at Pittsburg, pounds	47,468	97,335
Antimony, value at San Francisco, short tons	115	28,000
Platinum, value (crude) at San Francisco, troy ounces	500	2,000
NONMETALLIC (SPOT VALUES).		
Bituminous coal, long tons	85,383,059	94,346,809
Pennsylvania anthracite coal, long tons	40,714,721	65,879,514
Building stone	.....	42,809,706
Petroleum, barrels	35,163,513	26,963,340
Lime, barrels	68,474,668	33,217,015
Natural gas	.....	21,097,099
Cement, barrels	7,000,000	5,000,000
Salt, barrels	8,005,565	4,195,412
Limestone for iron flux, long tons	6,318,000	3,159,000
Phosphate rock, long tons	550,245	2,937,776
Mineral waters, gallons sold	12,780,471	1,748,458
Zinc, white, short tons	16,970	1,357,600
Gypsum, short tons	267,769	764,118
Borax, pounds	8,000,000	500,000
Mineral paints, long tons	32,307	463,766
Manganese ore, long tons	24,197	240,559
Asphaltum, short tons	51,735	171,537
Pyrites, long tons	93,705	202,119
Crude barytes, long tons	19,161	106,313
Bromine, pounds	418,891	125,667
Corundum, short tons	2,245	105,565
Marl, short tons	156,265	63,956
Fluorspar, short tons	9,500	45,835
Graphite, pounds	.....	72,662
Feldspar, long tons	6,970	39,370
Chromic iron ore, long tons	2,000	30,000
Mica, pounds	49,500	50,000
Cobalt oxide, pounds	13,955	31,092
Sulphur, short tons	1,150	7,850
Potter's clay, long tons	294,344	635,578
Grindstones	.....	439,587
Millstones	.....	35,155
Infusorial earth, short tons	3,466	23,372
Soapstone, short tons	12,715	231,708
Fibrous talc, short tons	23,746	244,170
Other products	.....	298,467

TABLE XVI.—VALUE OF THE MINERAL PRODUCTS, BY STATES AND TERRITORIES, 1889.

Alabama	$ 9,828,369	Georgia	$ 2,988,935
Alaska	926,568	Idaho	8,385,233
Arizona	7,248,717	Illinois	17,110,317
Arkansas	567,683	Indiana	9,704,949
California	19,699,351	Indian Territory	1,333,807
Colorado	41,126,610	Iowa	10,267,068
Connecticut	3,090,161	Kansas	5,935,981
Delaware	506,754	Kentucky	4,711,944
Dis'ct of Columbia	40,000	Louisiana	480,000
Florida	138,728	Maine	8,126,493
Maryland	5,089,447	Vermont	$ 5,674,022
Massachusetts	3,700,634	Virginia	6,023,076
Michigan	70,880,524	Washington	2,998,355
Minnesota	11,512,138	West Virginia	6,969,804
Mississippi	41,174	Wisconsin	10,183,861
Missouri	15,931,575	Wyoming	1,810,515
Montana	33,737,775	Mexican lead smelted in the United States	2,343,474
Nebraska	257,019	Undistributed copper	389,273
Nevada	10,143,874	Nickel in imported Canadian matte	21,000
New Hampshire	920,164	Copper from imported pyrites	603,940
New Jersey	8,275,936	Fuel displaced by natural gas used at pipe lines for drilling and pumping wells and for other uses	1,600,000
New Mexico	4,611,764		
New York	24,165,206		
North Carolina	451,625		
North Dakota	61,431		
Ohio	26,653,439		
Oregon	1,238,114		
Pennsylvania	150,876,649		
Rhode Island	987,055		
South Carolina	3,022,285		
South Dakota	3,685,862		
Tennessee	6,455,283		
Texas	1,985,679		
Utah	11,681,019	Total	$587,230,662

TABLE XVII.—VALUE OF PRODUCTION, SUM OF OPERATING EXPENSES, AND AMOUNT OF CAPITAL INVESTED IN THE PRINCIPAL MINERAL INDUSTRIES, 1889.

PRODUCTS.	Value of Production.	Operating Expenses.	Capital Invested.
Metallic:			
Iron ore	$33,351,978	$24,781,658	$109,766,199
Gold and silver	99,283,732	63,451,136	486,323,338
Copper	26,907,809	12,062,180	62,623,228
Quicksilver	1,190,500	881,401	a1,333,114
Nickel and cobalt	b40,000	126,187	279,000
Nonmetallic:			
Manganese ore	240,559	123,958	2,188,950
Coal, bituminous	94,346,809	85,324,193	180,722,319
Coal, anthracite	65,879,514	61,212,087	162,035,610
Petroleum	26,963,340	8,546,900	114,157,370
Natural gas	c11,044,858	14,920,886	59,682,154
Asphaltum	171,537	98,337	2,651,500
Stone quarries, building	d53,035,620	40,772,803	90,212,433
Phosphate rock	2,937,776	1,985,511	6,131,718
Gypsum	764,118	433,347	2,473,175
Infusorial earth	23,372	16,678	110,750
Corundum	105,565	57,105	73,400
Millstones	35,155	21,384	54,945
Whetstones	32,980	23,804	57,510
Mica	e52,450	58,335	691,550
Asbestos	1,800	3,225	42,600
Graphite	f72,662	54,741	259,475
Soapstone	231,708	163,438	924,900
Barytes	106,313	64,807	351,150
Ocher	177,472	86,247	386,453
Metallic paint	286,294	163,787	462,164
Fluorspar	45,835	22,246	192,000
Sulphur	7,850	4,110	320,750
Pyrites	202,119	163,256	1,358,882
Mineral waters	1,748,458	1,168,751	5,994,683

Subjoined will be found summaries of the notable productions and tabular details of the most important mineral industries, all for the calendar year 1889:

Coal.—

Number of mines	12,552
Number of officers, clerks, etc	2,936
Salaries	$2,193,876
Number of wage-earners	296,623
Wages	$106,937,058
Cost of supplies and materials	$18,828,590
Product, short tons	141,229,513
Value	$160,226,323

These statistics are for the operation of both bituminous and anthracite coal mines. The world's production of coal of all kinds in 1889 was 531,797,039 short tons, of which 26.6 per cent. was mined in the United States.

For coal areas and details of production, see section on *Coal Measures of the United States.*

Iron Ore.—

Number of mines	592
Number of officers, clerks, etc	520
Salaries	$529,043
Number of wage-earners	37,707
Wages	$13,880,108
Cost of supplies and materials	$4,998,988
Product, long tons	14,518,041
Value	$33,351,978

All kinds of iron ore, the red and brown hematites, magnetites, and carbonates, which include not alone ore used in the manufacture of pig iron, but also manganiferous iron ore used in the production of spiegeleisen and the argentiferous manganiferous iron ore used as a flux in the smelting of ore containing precious metals, and as a "fix" in puddling, are comprised in the foregoing statement. The greater part of the iron ore of the United States is supplied by the Lake Superior region, located in the States of Minnesota, Michigan, and Wisconsin. This region comprises (1889) four ranges, of which the oldest is the Marquette, in the upper peninsula of Michigan, which was opened in 1854, and ships its ore principally from the ports of Marquette and Escanaba. The second range, the Menominee, located in the States of Michigan and Wisconsin, was opened in 1877, and since then has made its principal shipments through the part of Escanaba, with some through Gladstone. The third range, the Gogebic, in the States of Michigan and Wisconsin, was opened in 1884, and the fourth range, the Vermilion, in Minnesota, also in 1884. The Gogebic, the largest shipper of the two, forwards through the parts of Ashland and Escanaba, and the Vermilion, through the part of Two Harbors. The production of the Lake Superior region in 1889 by ranges was as follows: Marquette, 2,631,026 long tons; Menominee, 1,876,157; Gogebic, 2,147,923; and Vermilion, 864,508,— total, 7,519,614.

The following table shows the amount, value, and distribution by States and Territories of the total production of 1889:

TABLE XVIII.—AMOUNT, VALUE, AND DISTRIBUTION OF IRON ORE PRODUCTION, 1889.

STATES AND TERRITORIES.	Mines Producing.	Production (long tons).	Value of Production.
Total	592	14,518,041	$33,351,978
Alabama	45	1,570,319	$ 1,511,611
Colorado	18	109,136	487,433
Connecticut, Maine and Massachusetts	7	88,251	265,901
Delaware and Maryland	14	29,380	68,240
Georgia and North Carolina	17	258,145	334,025
Idaho and Montana	7	24,072	158,974
Kentucky	4	77,487	135,559
Michigan	73	5,856,169	15,800,521
Minnesota	4	861,503	2,478,041
Missouri	8	265,718	561,041
New Jersey	24	415,510	1,341,543
New Mexico and Utah	2	36,050	70,956
New York	35	1,247,537	3,100,216
Ohio	70	254,294	532,725
Oregon and Washington	3	26,283	39,234
Pennsylvania	189	1,560,234	3,063,534
Tennessee	16	473,294	606,476
Texas	2	13,000	19,750
Virginia and West Virginia	38	511,255	935,290
Wisconsin	16	837,399	1,840,908

Gold and Silver.—

Number of mines	4,758
Number of officers, clerks, etc	873
Salaries	$1,347,373
Number of wage-earners	56,434
Wages	$40,412,022
Cost of supplies and materials	$13,817,739
Product, troy ounces	52,945,720
Value, coining	$99,283,732

In the above mines are embraced the placer mines, which produce gold usually associated with silver, and deep mines, which produce gold and silver bearing ore, some of them being equipped with reduction works where ore is reduced to bullion. The silver mines include also argentiferous lead mines. The following table shows the production of gold and silver in the United States by States and Territories in 1889:

TABLE XIX.—PRODUCTION OF GOLD AND SILVER, BY STATES AND TERRITORIES, 1889.

STATES AND TERRITORIES.	Total Value.	Production.			
		Gold.		Silver.	
		Fine Ounces.	*Value.*	*Fine Ounces.*	*Coining Value.*
Total	$99,283,732	1,590,869	$32,886,744	51,354,851	$66,396,988
Alabama	$ 2,639	123	$ 2,539	77	$ 100
Alaska	916,568	43,762	901,650	9,219	11,918
Arizona	3,254,151	44,029	910,174	1,812,961	2,343,977
California	13,960,529	608,882	12,586,722	1,062,578	1,373,807

Wyoming	14,512	711	14,512	.....	.....

The most important event in the history of mining in the United States was the discovery of gold in California, which led to the rapid development, not only of a new industry, but of a new empire. The settlement of the Pacific slope was making but slow progress under the inducements of a scanty commerce in furs and hides. The liberal grants offered by the Government to agricultural pioneers in Oregon, had attracted to the Willamette valley and other favored points in that Territory a limited population; but the government of the Mexicans in California was positively unfavorable to enterprise. It is true that gold was known to exist in the country. Rumors of it were current among the trappers, and placers had actually been worked in what is now Los Angeles county; but the *padres* of the neighboring mission of San Fernando had discouraged the business as demoralizing to their flocks; and the existence of the precious metal was not widely known. Still less was its distribution northward suspected. The discovery of gold, January 19, 1848, at Sutter's sawmill, on the south fork of the American River, afterward famous as Coloma, in Eldorado County, was the beginning of the new epoch. This discovery was made by James Wilson Marshall, a partner in the mill, who observed in the *débris*, washed down by the tail-race, a glittering fragment of a mineral unknown to him Suspecting it to be gold, he sought for further specimens, and obtained, in the course of a few days, several ounces of it. Tests subsequently made established its character; and the news spread with great rapidity, arousing an excitement throughout this country, and even in European countries, which has never been paralleled. March 15, 1848, a San Francisco newspaper contained a paragraph giving the tidings. In May, the same paper announced the suspension of publication; and the editors and workmen, imitating their fellow-citizens of every class, went off to the diggings. Two years later, the population of California had risen from 15,000 to 100,000, and the gold-bearing zone extending along the west flank of the Sierra to Oregon, had been put under active exploitation. The placers of the southern counties of Oregon were opened in 1852; those of the John Day and Powder Rivers in 1860. Gold was discovered in Idaho, on the banks of the Pen D'Oreille River, in 1852; but the active development of the Territory dates from the discovery of the Oro Fino mines in 1860, and the opening, two or three years later, of the rich Boise Basin. Montana was found to be auriferous in 1858 (possibly earlier), and in 1860 placer-mining was inaugurated.

In 1862, a considerable immigration from Pike's Peak (then the general name for Colorado) set in. The gulches of Colorado began to be worked in 1859; and that Territory was rapidly settled, chiefly by immigrants from the East — in contrast to Nevada, Idaho, Oregon, and Arizona, the pioneer population of which was largely an overflow of the restless enterprise of California. In Arizona, gold is said to have been discovered in 1858 on the Gila River. In Nevada and Utah, no gold placers of importance have been found, though the metal is not entirely absent from the mountain ravines, and in some instances, particularly at the Comstock lode, in Nevada, it constitutes a considerable portion of the value of argentiferous ores.

The first form of gold-mining in these States and Territories was that of diggings. The miner loosened the auriferous soil with a pick, and shoveled it into a pan, from which, by skillful manipulation in water, the clay, sand, and pebbles were removed, and the heavier particles of gold-dust left behind. The first improvement on the pan was the rocker; afterward the "tom" was introduced, from Georgia, and with it the sluice. In 1850 and 1851 the two latter devices began to be generally employed, in consequence of the greater convenience of water-supply afforded by the mining ditches. The first ditch of importance was made in 1850; and its success so stimulated imitation that, in the course of eight years, 6,000 miles of mining canals had been constructed, at a cost of more than $15,000,000, in California alone.

The development of the gold-mining industry was attended with much excitement, and many fluctuations. A phenomenon more frequent in early days than at present was that of the "stampedes" or sudden migrations of whole communities, on receipt of tidings of rich discoveries in new localities.

Perhaps the most remarkable of these was the so-called Fraser fever in 1858, when, in the course of four months, 18,000 men, nearly one-sixth of all the voters in California, went to Fraser River in British Columbia, expecting to find another virgin gold-field and to restore the "flush times" of 1849. The excitement reached its climax before any gold had been received from the new diggings in San Francisco, and was founded wholly upon rumors and reports of rich deposits on a bar of Fraser River, and upon the presumption that large and valuable placers would be found in the upper basin of that stream. The first discoveries were made in the spring; and the fever died out as suddenly as it had arisen, five-sixths of the adventurers returning before the end of the year.

At the present time the resources of the Pacific States and Territories are sufficiently well known to prevent these miscellaneous and excited migrations of population. It is not likely that new deposits will be discovered, offering large returns to individual labor without capital or machinery. The present chief sources of the gold product of the West are three: first, old and well-known placer-mining regions, where the ground continues to be worked with sluices and to pay a reasonable profit to miners, who usually operate in partnerships and companies (as do the Chinese); secondly, deep placers and cement deposits, which are worked by drifting and blasting, and by the hydraulic process, usually in the hands of powerful and wealthy joint-stock companies; and thirdly, quartz mines, operated by individuals or companies.

Silver-mining in the West, apart from the early operations of the Spaniards in New Mexico and perhaps in Arizona, may be said to date from the discovery of the Comstock vein in 1859. This vein is in Nevada, on the east flank of the Sierra. According to some accounts, it was discovered as early as 1857, and the placer-diggings in the cañon below its outcrop were found as early as 1849 and worked by a small population from 1852. The gold contained a large proportion of silver, in some claims nearly one-half the value of it — a circumstance which was considered a misfortune by the miners, since it reduced the value per ounce of the gold-dust as currency from $17 or $18 to $10 or $12. In the vein itself the proportion of gold has usually been about one-third of the total value of the bullion. The revelation that the gray sulphuret of silver from the vein was a rich ore worth thousands of dollars per ton gave rise to perhaps the most intense excitement that has ever swept through the West, since the first discovery of gold. As usual in such cases, many older districts were suddenly depopulated and the mining industry was sadly demoralized. The State of Nevada was rapidly overrun by pioneers, and the silver districts of Esmeralda, Lander, and Humboldt counties, were explored and developed with an energy which proved in many cases premature. The Washoe excitement maintained for three years its predominance; but all the silver-mining enterprises of the State shared in the encouragement afforded by the first success of the mines of Virginia City. In 1863 the panic swept away some thousands of wild-cat speculations, and the Comstock mines themselves fell greatly in nominal value. A ruinous litigation, involving millions of dollars of expenditure, assisted this reaction. The discovery of immense bodies of ore at the depth of more than 1,500 feet below the surface in the Comstock lode, brought the product of that vein to a figure not inferior to those of its best days. The silver-mining districts of Owyhee in Idaho, Unionville, Reese River, Belmont, Pioche, White Pine, and Eureka in Nevada, continue to be productive. The latter district and the silver districts of Utah and some of Montana and New Mexico, as well as that of Cerro Gordo in California, produce argentiferous galena and carbonate of lead, which are reduced by smelting in shaft furnaces. The Washoe ores and those of Pioche are treated by the so-called Washoe process, consisting of crushing in stamp-mills and subsequent amalgamation in pans. The ores of Reese River, Belmont, and Unionville in Nevada, and of Georgetown, Colorado, are treated by preliminary roasting with salt, and subsequent amalgamation. From Colorado and Utah considerable quantities of rich ore are shipped to American and foreign smelting works.

The following table shows the production of gold and silver in the United States from 1792 to 1889, inclusive:

TABLE XX.—PRODUCTION OF GOLD AND SILVER IN THE UNITED STATES IN 1792–1889.

[The estimates for 1792 to 1873 are by Dr. R. W. Raymond, United States mining commissioner, and since by the Director of the Mint.]

Year.	Total.	Gold.	Silver (coining value).
April 2, 1792, to July 31, 1834	$14,000,000	$14,000,000	Small.
July 31, 1834, to Dec. 31, 1844	7,750,000	7,500,000	$ 250,000
1845	1,058,327	1,008,327	50,000
1846	1,189,357	1,139,357	50,000
1847	939,085	889,085	50,000

1886	86,000,000	35,000,000	51,000,000
1887	86,350,000	33,000,000	53,350,000
1888	92,370,000	33,175,000	59,195,000
1889:			
Mint	97,446,000	32,800,000	64,646,000
Census	99,282,866	32,886,180	66,396,686

Copper.—

Number of mines	not reported
Number of officers, clerks, etc	70
Salaries	$123,236
Number of wage-earners	9,750
Wages	$6,610,781
Cost of supplies and materials	$5,638,694
Product, pounds	226,055,962
Value	$26,907,809

The value here given is that of the fine copper contents of all ores, including those whose chief value was that of their precious metal contents. Owing to the unwillingness of some operators to furnish information concerning their business, the above totals must be considered as approximate.

The production of copper was from the following localities, in pounds:

Arizona	31,586,185	California	151,505
Michigan	87,455,675	Wyoming	100,000
Montana	98,222,444	Vermont	72,000
New Mexico	3,686,137	Southern States	18,144
Colorado	1,170,053	Lead Smelters and refiners	3,345,442
Idaho	156,490		
Nevada	26,420	Total	226,055,962
Utah	65,467		

TABLE XXI.—PRODUCTION OF COPPER IN THE UNITED STATES, 1845–1889.

[Long tons.]

Year.	Total production.	Lake Superior.	Percentage of Lake Superior of total production.
1845	100	12	12
1846	150	26	17.3
1847	300	213	71
1848	500	461	92.2
1849	700	672	96
1850	650	572	88
1851	900	779	86.6
1852	1,100	792	72
1853	2,000	1,297	64.9

1870	12,600	10,992	87.2
1871	13,000	11,942	91.9
1872	12,500	10,961	87.7
1873	15,500	13,433	86.7
1874	17,500	15,327	87.6
1875	18,000	16,089	89.4
1876	19,000	17,085	89.9
1877	21,000	17,422	83
1878	21,500	17,719	82.4
1879	23,000	19,129	83.2
1880	27,000	22,204	82.2
1881	32,000	24,363	76.1
1882	40,467	25,439	62.9
1883	51,574	26,653	51.6
1884	64,708	30,961	47.8
1885	74,052	32,209	43.5
1886	70,430	36,124	51.3
1887	81,017	33,941	41.9
1888	101,051	38,604	38.2
1889	101,239	39,364	38.7

Year.	Montana.	Percentage of Montana of total production.	Arizona.	Percentage of Arizona of total production.
1881				
1882				
1883	11,011	21.3	10,658	20.7
1884	19,256	29.8	11,935	18.4
1885	30,267	40.9	10,137	13.7
1886	25,362	36	6,990	9.9
1887	35,133	43.4	7,910	9.7
1888	43,704	43.2	14,195	14
1889	43,849	43.3	13,654	13.5

Petroleum.—

Number of wells	35,163
Number of officers, clerks, etc	173
Salaries	$163,156
Number of wage-earners	22,366
Wages	$8,383,744
Cost of supplies and materials	$9,505,965
Product, barrels	55,163,513
Value	$26,963,340

This production of crude petroleum was from the following fields: Pennsylvania and New York, 21,487,435 barrels; Ohio, 12,471,466; West Virginia, 544,113; California, 3 3,220; Kentucky and Tennessee, 5,400; Colorado, 316,476; Indiana, 33,375; Illinois, 1,460; Kansas, 500; Texas, 48; and Missouri, 20.

In the table on the opposite page will be found a statement of the production of crude petroleum in the United States from the beginning of production, marked by the drilling of the Colonel Drake well in 1859, up to and including the production of 1889, the table being by years and States.

Natural Gas.—

Number of wells	2,247
Number of officers, clerks, etc	785
Salaries	$525,956
Number of wage-earners	5,899
Wages	$1,210,433
Cost of supplies and materials	$13,184,497
Value of product	$21,107,099

The amount received for the gas consumed was given as $11,044,858, and the value of the fuel displaced by the gas was computed as the actual value of the product. In the following table is given the approximate value of natural gas produced and sold in the United States in 1889, by States:

TABLE XXIII.—APPROXIMATE VALUE OF NATURAL GAS PRODUCED IN THE UNITED STATES, 1889 BY STATES.

State.		State.	
Arkansas	$ 375	Ohio	$ 5,215,669
California	12,680	Pennsylvania	11,593,989
Colorado		South Dakota	25
Illinois	10,615	Texas	1,728
Indiana	2,075,702	Utah	150
Kansas	15,873	West Virginia	12,000
Kentucky	2,580	Other States	1,600,000
Missouri	35,687		
New York	530,026	Total	$21,107,099

The early use and development in the United States of this most perfect fuel was chiefly due to its observed presence in natural springs, afterwards to artesian-well drilling in search of salt brine. In subsequent years the search for petroleum, with which it is usually associated, developed large areas of high pressure reservoirs of this remarkable hydrocarbon, which is to-day and has been for the last thirty years, a most economical and convenient source of heat, light, and power. Outside of the United States its production is insignificant — not over 1½ per cent of the quantity produced in this country. A large portion of this outside production comes from our neighbor — Canada. Its introduction into commercial use was slow, and it required several years for its value to begin to be appreciated. After its value was fully demonstrated there was a rush of capital, and a large amount of money was invested in gas territory, gas wells, and pipe lines. Then followed a period of

reckless consumption and appalling waste. These conditions rapidly depleted many of the original fields of their high pressure and brought about the necessity of building larger and in many cases much longer lines to reach more remote districts where the original pressure was known to exist in reservoirs which contained it in commercial quantities, and by their remoteness were not subject to the ruinous competition that helped to exhaust the nearer original fields. Many of these more recent localities of high-pressure gas were developed in the search for petroleum; others were located by structural conditions of the strata, as natural gas inevitably seeks the higher portions of the rock in which it is sealed. Not until it was fully realized that a large proportion of our then known natural supply had been consumed and dissipated by the extravagant and wanton methods in use, were improved methods adopted for holding back the gas in the original rock reservoirs.

Lead and Zinc Ore.—

Number of mines	not reported
Salaries of officials	$21,033
Wages of wage-earners	$1,220,766
Cost of supplies and materials	$407,938
Product, lead, short tons	156,397
Product, zinc, short tons	58,860

The above includes all non-argentiferous lead and zinc ores, which usually occur together. Auriferous and argentiferous lead and zinc ores are included in the summary of gold and silver mines.

TABLE XXIV.—SUMMARY OF LEAD PRODUCTION IN THE ROCKY MOUNTAIN STATES AND TERRITORIES, 1889.

STATES AND TERRITORIES.	Tons.	Value.
Total	130,903	$4,712,757.27
Arizona	3,158	98,747.84
California	53	1,999.65
Colorado	70,788	2,101,014.31
Idaho	23,172	1,042,629.31
Montana	10,183	456,975.40
Nevada	1,994	72,653.64
New Mexico	4,764	170,754.59
South Dakota	116	4,653.44
Utah	16,675	763,329.09

TABLE XXV.—PRODUCT OF LEAD AND ZINC MINES EAST OF THE ROCKY MOUNTAINS, 1889.

STATES.	Total value.	ZINC ORE.		LEAD ORE.	
		Short tons.	Value.	Short tons.	Value.
Total	$4,804,179.24	234,503	$3,049,799.25	50,238	$1,754,379.99

Wisconsin	464,630.39	24,832	400,567.86	1,678	64,062.53

a Includes all production prior to 1876.
b Includes all petroleum produced in Kentucky and Tennessee prior to 1883.
c In addition to this amount, it is estimated that for want of a market some 10,000,000 barrels ran to waste in and prior to 1862 from the Pennsylvania fields; also a large amount from West Virginia and Tennessee.
d Includes all production prior to 1876 in Ohio, West Virginia, and California.

The following tables present the figures of the total gross production of lead in the United States from 1825. Up to the year 1882 the figures were compiled from the best data available. Since 1882 the statistics are those collected by the United States Geological Survey Division of Mineral Resources, with the exception of the year 1889, when they were gathered by the Census Office:

TABLE XXVI.—PRODUCTION OF REFINED LEAD IN THE UNITED STATES FROM 1825 TO 1882, INCLUSIVE.

Salt.—About seventy-five per cent. of the total production of salt in the United States is obtained in Michigan and New York, the other leading producers being Kansas and Ohio. In the census year 1880 the total production was 5,961,060 barrels, valued at $4,828,566; in 1889 the production rose to 8,005,565 barrels, but the value fell to $4,195,412. The supply of salt for domestic consumption in 1889 was, from domestic production, 8,005,565 barrels; imports, 1,833,452 barrels—total, 9,839,017; deduct exports 19,209 barrels; amount for domestic consumption, 9,819,808 barrels.

Clay.—The United States census of 1880 reported nine kaolin mines, having 23,277 tons of products valued at $200,457. Four were situated in Newcastle County, Del.; two in South Carolina; and one each in Indiana, Maryland and New York. In 1889 the value of all brick clay produced was estimated at $8,000,000, and the yield of clay for pottery, terra cotta and ornamental work was 294,344 long tons, valued at $635,578.

Cement.—According to the census of 1880 there were in the United States 28 mines or quarries producing the raw material for the manufacture of Portland and natural rock cement, employing 2,102 wage-earners, paying $750,367 for wages and $500,463 for supplies and materials, and yielding 2,072,943 barrels, valued at $1,852.707. The total output in 1889 was estimated at 7,000,000 barrels, valued at $5,000,000.

GEORGE J. HAGAR

PART III.—POLITICAL GEOGRAPHY AND STATISTICS.

Population and Immigration.

The first census of the United States was taken in 1790, and there has been one taken every tenth year since that time. The following table shows the absolute number of inhabitants, "excluding Indians not taxed," at each decennial period, and also the rate per cent. of increase during the previous ten years:

Year.	Population.	Percentage of Increase.
1790	3,929,214	
1800	5,308,433	35.11
1810	7,229,881	36.40
1820	9,633,822	33.06
1830	12,806,020	33.55
1840	17,069,453	32.67
1850	23,191,876	35.86
1860	31,443,321	35.58
1870	38,558,371	22.63
1880	50,155,783	30.08
1890	63,231,428 estimate.	

Growth of population.

The effect of the Civil War on the growth of population in the United States is easily seen in the diminished ratio of increase shown by the figures for the decade 1860–70. With that exception the rate has been extraordinary large and uniform, but less in the decade 1870–80 than in any preceding one. That this rapid growth of the population, due in so large a part to immigration, will continue to be maintained is in the highest degree improbable. The fact that nearly the whole of the more valuable portion of the public lands has been already taken up, as will be seen farther on, can hardly fail to check immigration, although the population, is at present, far from dense, and far from being so large that there is not ample room for a much larger number.

The area embraced within the United States at the time of taking the first census was about eight hundred and fifty thousand square miles, a precise statement of the amount being impossible, owing to the peculiar wording of that part of the treaty in which the northern and western boundaries of the country are defined. The density of the population at that time was about 4.6 persons per square mile, this population being almost exclusively confined to the Atlantic sea-board. At that time not more than five per cent. of the inhabitants of the country lived west of the Appalachian range, the settlements being very closely limited to the borders of the navigable streams. At the time of taking the census of 1850, the boundaries of the United States had become definitely established, the only addition made since that time being the territory acquired in 1853 by the Gadsden purchase (about 47,330 square miles). At that time the average density of the population of the whole country was a little less than eight persons per square mile.

The following table shows the density of the population at the epoch of each census which has been taken during the time when the area of the country remained (with the exception of the purchase of Alaska, not here included) unchanged:

Year.	Area of U. S.	Population per Sq. Mile.
1860	3,025,600	10.39
1870	"	12.74
1880	"	16.57

Movement of population.

The movement of the population has, from the beginning, been from the east toward the west, the first settlements having been made on the Atlantic coast, and the emigration to the United States having been almost exclusively from European countries. The Pacific coast had, previously to the annexation of California, received a small number of whites coming from Mexico, and since that time there have been some accessions to the population in that region by means of immigration from China; but the number added from this direction is almost insignificant in comparison with that which has come into the country from the east. Hence the center of population has been moving westward, and the investigations of the Coast Survey and of the Census Bureau have shown that this movement has been in an almost exactly westerly direction, and that the center of population has always remained very near the parallel of 39°. In 1790 it was in the latitude 39° 16′.5, at a point of about twenty-three miles east of Baltimore; in 1880 it was eight miles west by south from Cincinnati, in latitude 39° 4′.1, having moved westward 457 miles in ninety years. The most southerly point reached was that of 1830, when the center was in latitude 38° 57′.9; the most rapid movement was in the period of 1850–60—namely eighty-one miles, this being due to the rapid transfer of a considerable population from the Eastern to the Pacific States, consequent on the discovery of the gold of California.

The division of the population by sexes, as shown by the census of 1880, was as follows:

Males	25,518,820
Females	24,636,963

The number of females for each 100,000 males in 1870 and 1880 was as follows:

	1870.	1880.
Number of females to 100,000 males	96,514	97,891

Conditions influencing population.

As a natural result of the conditions influencing emigration from the older to the newer States, it is found that females are in excess in the Atlantic States. In the District of Columbia, Rhode Island and Massachusetts, the excess of females over males is five per cent. or more; in Connecticut, New Hampshire, North Carolina, South Carolina, New York, Virginia and Alabama, it is from two and a half to five per cent.; in Maryland, Georgia, New Jersey, Louisiana, Tennessee, Pennsylvania and Maine it is less than two and a half per cent. The States on the other hand, in which the males are considerably in excess of the females, are those situated in the Cordilleran region, where mining is the chief pursuit, and where the conditions of life are such as are more easily borne by men than by women. In Michigan, Minnesota, Kansas and Nebraska, which are not Cordilleran States, but, which are on the extreme northern, western or southwestern borders of the Central region, the number of females is from eighty to ninety per cent. of that of the males, and New Mexico is in the same category. In the Pacific coast States the number of females is from fifty to eighty per cent. that of the males; and the same is true of Colorado and Dakota, which are situated on the eastern borders of the Rocky Mountains, and which are partly agricultural and partly mining States. In those States in which mining and stock-raising are by far the predominating interests, and which are entirely inclosed in the Cordilleras, namely, Idaho, Nevada, Wyoming and Montana, the inequality in the numbers of the sexes is greatest, there being in these territories less than half as many females as males. The same inequality exists in the territory of Arizona.

Of the colored population the census of 1880 showed the number to be 6,580,793 to 43,402,970 whites, or 15,162 colored in every 100,000 whites. The slight increase in this ratio from that given by the census of 1870 (14,528 to 100,000) is believed to be chiefly, if not entirely, due to the imperfection of the census of 1870. The colored population is still, in spite of some slight emigration, almost entirely confined to the former slave States, and in three of them—South Carolina, Mississippi and Louisiana—the colored are in excess of the whites. In Alabama, Florida, Georgia, Virginia, North Carolina and the District of Columbia the colored element runs from fifty to ninety per cent. of the white; in Arkansas, Texas, Tennessee and Maryland, from twenty-nine to thirty-five per cent.; in Delaware and Kentucky, from nineteen to twenty-two per cent.; in Missouri, Kansas, West Virginia, New Jersey, Ohio, Rhode Island, Pennsylvania and Indiana, from two to seven per cent.; in all the remaining States it is less than two

per cent.; and in most of them, especially the more northern ones, it is less than one per cent.

DISTRIBUTION OF THE POPULATION OF THE UNITED STATES IN 1880, BY DRAINAGE BASINS.

Drainage Basin.	Area in Sq. Miles.	Population.	
		Total.	Per Sq. Mile.
New England Coast	61,830	3,788,334	61.2
Middle Atlantic Coast	83,020	9,240,897	111.3
South Atlantic Coast	132,040	4,114,563	31.2
Great Lakes	175,340	5,684,147	32.4
Gulf of Mexico	1,725,980	25,884,117	14.9
Total Atlantic	2,178,210	48,717,293	22.4
Great Basin	228,150	227,107	1.0
Pacific Ocean	619,240	1,211,383	1.9
Total	3,025,600	50,155,783	

The distribution of the population in reference to the topographical and climatic features of the country is such as naturally arises from the constant operation of two causes, both acting in the same direction. Emigration and overflow from a more thickly settled region toward one more thinly inhabited takes place, with insignificant exceptions, from the east toward the west. Immigrants arrived from Europe, are landed on the Atlantic coast — about three-fourths at one point, New York — and thence in large part find their way westward in the direction of lands unoccupied or only thinly settled. To the east of the Mississippi the land is almost everywhere exceptionally fertile, and the climatic conditions are, over a large area, as explained elsewhere, very much the same, and on the whole highly favorable. Soon after crossing the Mississippi, we find that this favorable condition of things begins to change. Not only is the immigrant getting farther and farther from his home, but he is finding his environment less and less suited to the development of those conditions which favor the existence of a dense population. Never, by any possibility, can the region of small rainfall, and, in large part, of rugged mountains, extending from the first belt of States beyond the Mississippi to the belt lying directly on the Pacific coast, become a densely populated portion of the country. This dryer region is also the most elevated, as has already been fully explained. The results of the conditions thus indicated are sufficiently shown in the above table and the following:

GEOGRAPHICAL DISTRIBUTION OF THE POPULATION OF THE UNITED STATES IN ACCORDANCE WITH THE TOPOGRAPHICAL FEATURES.

Region.	Population.	Percentage of Total Population.
North Atlantic Coast	2,616,882	5.2
Middle Atlantic Coast	4,375,194	8.7
South Atlantic Coast	875,387	1.7
Gulf Coast	1,055,851	2.1
Northeastern Appalachian Region	1,669,226	3.3
Central Appalachian Region	2,344,223	4.7
Region of the Great Lakes	3,049,470	6.1
Interior Table-land	5,716,326	11.4
Southern Appalachian Region	2,695,085	5.4
Ohio Valley	2,442,792	4.9
Southern Interior Table-land	3,627,478	7.2
Mississippi River Belt, south	710,268	1.4
Mississippi River Belt, north	1,991,362	4.0
Southwestern Central Region	2,932,807	5.8
Central Region	4,401,246	8.8
Prairie Region	5,722,485	11.4
Missouri River Belt	835,445	1.7
Western Plains	323,819	0.7
Heavily Timbered Region of the Northwest	1,122,337	2.2
Cordilleran Region	932,311	1.9
Pacific Coast	715,789	1.4

The larger divisions of the country are represented as follows, both as to the aggregate population and its different elements:

Region.	Percentage of Population.		
	Total.	Foreign.	Colored.
Atlantic Plain	29.84	32.74	40.50
Central Valley	53.50	51.62	50.02
Appalachian Region	13.38	8.40	7.22
Cordilleran Region	3.28	7.24	2.26

In regard to the distribution of the population of the United States in towns and cities, and the positions of those centres, the following may be stated:

In 1790 there were in the country four cities having a population of from 8,000 to 20,000 and two above 20,000, but not one surpassing 75,000 in number. Fifty years later, there were forty-four towns and cities having a population of 8,000 and over, and one of about 500,000. In 1880 there were 286 towns with over 8,000 inhabitants.

The following statement gives the names and population of all the cities having, in 1890, a population of over 100,000:

OVER 1,000,000.

Name.	Population in 1890.
New York	1,513,501
Chicago	1,098,576
Philadelphia	1,044,890

OVER 500,000 AND UNDER 1,000,000.

Brooklyn	804,377

OVER 250,000 AND BELOW 500,000.

St. Louis	460,357
Boston	446,507
Baltimore	433,639
San Francisco, Cal.	297,990
Cincinnati	296,309
Cleveland, Ohio	261,546
Buffalo, N. Y.	255,543

OVER 100,000 AND BELOW 250,000.

New Orleans, La.	241,995
Pittsburg, Penn.	238,473
Washington, D. C.	228,160
Detroit, Mich.	207,791
Milwaukee, Wis.	203,979
Newark, N. J.	182,020
Louisville, Ky.	185,756
Minneapolis, Minn.	164,780
Jersey City, N. J.	163,987
Rochester, N. Y.	135,302
Omaha, Neb.	134,742
St. Paul, Minn.	133,156
Providence, R. I.	132,043
Denver, Col.	126,186
Indianapolis, Ind.	125,000
Kansas City, Mo.	105,000
Allegheny City, Pa.	104,967

OVER 75,000 AND BELOW 100,000.

Scranton, Pa.	95,000
Albany, N. Y.	95,523
New Haven, Ct.	85,931
Worcester, Mass.	82,133
Richmond, Va.	80,300
Paterson, N. J.	78,300
Memphis, Tenn.	75,360

The census of 1880 showed that of the total population, 50,155,783, there were 6,679,143 born in foreign countries, or 15,364 persons foreigners to 100,000 native born; this ratio was a little less than in 1870, when the number of foreign born was 16,875 to 100,000 native.

Number of immigrants arriving in United States.

The following tables show the number of immigrants arriving in the United States for each decade from 1821 to 1880, and for each year from 1881 to 1887. The yearly average during each decade rose rapidly, from 14,344 in the decade 1821–30 to 294,469 for the decade 1871–80. The number of immigrants for the year 1881 was more than twice as great as the yearly average of the preceding decade. The maximum was reached in 1882, when the number of immigrants reached 730,349, from which time forward there was a falling off, the figures in 1885 being 350,510. A portion of this apparent decrease seems to be due to the fact that the sta-

tistics of the immigration by land from Canada and Mexico — the latter very small in amount, however — could not be collected; so that since July 1, 1885, arrivals of this kind have been excluded from the tables of immigration. In the first table herewith given, the nationality of the immigration is only imperfectly given, the British Islands being separated from the rest of Europe, and the figures also being for China. As will be noticed, the immigration from Europe and China made up about five-sixths of the total during the decade 1871–80. But in the decade 1851–60 the immigration from Europe made up twenty-four twenty-fifths of the total, that from China being practically null. The apparent increase of immigration from extra-European countries indicated in the table for the decades since 1860 is chiefly due to the rapid increase of immigration into the United States from the adjacent Dominion; but this is made up in part of persons who have come to the United States from Europe by way of Canada:

STATEMENT OF IMMIGRANT ARRIVALS IN THE UNITED STATES FOR THE DECADES 1821–80.

From	1821–30	1831–40	1841–50	1851–60	1861–70	1871–80
British Islands	75,803	283,191	1,047,763	1,338,003	1,106,970	980,163
Rest of Europe	23,013	212,497	549,739	1,111,564	1,073,429	1,357,801
China	2	8	35	41,397	68,050	122,433
Rest of the World	44,621	103,429	115,714	104,160	349,756	475,295
Total	143,439	599,125	1,713,251	2,598,214	2,466,752	2,944,695
Yearly Average	14,344	59,912	171,325	259,821	246,675	294,469

STATEMENT SHOWING IMMIGRANT ARRIVALS IN THE UNITED STATES FOR THE YEARS 1881–87.

From	1881.	1882.	1883.	1884.	1885.	1886.	1887.
British Islands	165,230	161,428	157,361	121,756	105,610	126,601	179,609
Rest of Europe	435,101	441,658	341,136	285,850	221,592	258,847	328,651
China	20,711	35,614	381	84	57	8	28
Rest of the World	99,003	91,649	71,438	53,656	23,251	7,431	8,645
Total	720,045	730,349	570,316	461,346	350,510	392,887	516,933

[In this and the following table notice must be taken of the fact that for the last half of 1885 and for 1886 and 1887 the immigration from British North America and Mexico is not included.]

Still further light will be thrown on this subject by the following table, in which the nationality of the immigration into the United States is given in considerable detail for the years 1881 to 1887, in percentages of the total amount. From this table it will be seen that Germany has furnished during the past seven years somewhat less than one-third of the total immigration; Great Britain and Ireland somewhat more than a quarter; Norway and Sweden about a tenth; British North America about a tenth; Austro-Hungary a little over six per cent.; Russia (including Poland), from four to five per cent.; and Italy nearly the same. These nationalities together have furnished during the past six years about ninety-five per cent. of the total. The immigration from Italy and Russia shows a moderately rapid, but pretty uniform, increase from year to year:

PERCENTAGE TABLE SHOWING THE NATIONALITY OF IMMIGRANTS INTO THE UNITED STATES FOR THE YEARS 1881–84.

	1881.	1882.	1883.	1884.
Great Britain	13.10	12.11	12.92	13.69
Ireland	9.85	9.99	14.67	12.70

The immigration into the United States is very unequally distributed over the surface of the country. An inspection of the census tables and the accompanying maps shows that immigrants in very large proportion seek Northern regions. In the Southern States, with the exceptions of Florida, Louisiana and Texas, the foreign element is practically null. Virginia, North Carolina, South Carolina, Alabama, Georgia, and Mississippi have less than one per cent. of foreign born population; and no State south of Pennsylvania and the Ohio River and east of the Mississippi has as much as four per cent. In the belt of States between the parallels of 41° and 45°, on the other hand, the foreign element is most strongly represented. Thus in Massachusetts, Connecticut, Rhode Island, New York, Michigan, Wisconsin, Minnesota, and Dakota the foreign born population is over twenty-five per cent. of the native, and in the two last-named States over fifty per cent. Iowa, Nebraska, and Kansas, forming a belt of States extending southwesterly from Wisconsin and Minnesota to the 37th parallel, have a foreign born population ranging between ten and twenty-five per cent. of the native, except in the case of Nebraska, where the foreign is a little over twenty-five per cent. In some of the thinly inhabited States farther west the foreign element is still more prominent, as in Colorado, Utah, Nevada, Arizona, and California. In Nevada, for example, according to the census of 1880, the foreign born inhabitants were to the natives in the ratio of 70,065 to 100,000. But it must be remembered in

* The immigration into the United States arriving at the six principal ports (embracing about ninety-eight per cent. of the entire immigration) was, for the first nine months of the year 1888, 432,802, a slight increase over that of the corresponding months of the preceding year.

this connection that the entire population of Nevada at that time was only 62,266, and that of Arizona 40,440. In no State or Territory does the foreign element equal the native, and only in Nevada, Arizona, Dakota, Minnesota, and California is it more than half as large, while in the two last-named States it is but little more than half. Texas forms an exception to the other Southern States, the foreign element being of importance, especially in the southwestern portion of the State. The State as a whole has, however, only a little less than eight per cent. of foreign born inhabitants.

The percentage increase of the native white element of the population was, for the three decades 1851–80, as follows:

1851–60	32.35
1861–70	22.95
1871–80	31.25

Early in 1882 an Act was passed by Congress suspending Chinese immigration into the United States for the term of twenty years. This was vetoed by the President, and another one was passed having nearly the same provisions as the first, but limiting the time of its operation to ten years. This Act was not vetoed; but became a law May 6, 1882. This second Act is entitled "An Act to execute certain treaty stipulations relating to Chinese." From and after ninety days after the passage of this Act the entrance of Chinese "laborers" into the United States was forbidden, and any master of a vessel bringing them here was punishable by a fine of $500 for each laborer so brought, and also by imprisonment for a term not exceeding one year. The pretext for this unprecedented Act was "that the coming of Chinese laborers to this country endangers the good order of certain localities" within the territory of the United States. The term "laborers" was held to mean "both skilled and unskilled laborers, and Chinese employed in mining."

Further legislation relating to the exclusion of the Chinese from the United States was had by Congress in 1888. The two Acts were passed, the first having been approved Sept. 13, 1888, and a second supplementary to this, Oct. 1, of the same year. The object of these two acts was to prevent the Chinese who were then in the United States from returning after having left this country. The first act (approved Sept. 13) allowed a native of China to return, provided he had a "lawful wife, child or parent within the United States, or property therein of the value of one thousand dollars, or debts of like amount due him and pending settlement." This privilege was entirely cancelled by the supplementary Act, approved Oct. 1; and as the matter now stands, only "Chinese officials, teachers, students, merchants, or travelers for pleasure or curiosity are permitted to enter the United States." Furthermore, it is provided that in order to become entitled to such entrance they must "obtain the permission of the Chinese Government or other Government of which they may at the time be citizens or subjects." This permission, and the personal identity of the party having obtained it, must be authenticated by the diplomatic or consular representative of the United States at the port or place from which the party comes. It is further provided that any master of a vessel landing, or attempting to land, any Chinese laborer "in contravention to the provisions of this Act, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished with a fine of not less than five hundred nor more than one thousand dollars, in the discretion of the Court, for every Chinese laborer or other Chinese person so brought, and may also be imprisoned for a term of not less than one year, nor more than five years, in the discretion of the Court."

Exclusion of Chinese.

Provisions have also been made by Act of Congress for the regulation of the immigrant carrying business, and rules have been prescribed as to food, water, light, space occupied, etc. A tax of fifty cents is also imposed on all immigrants landing in this country to be used "in defraying the expense of regulating immigration under this Act, and for the care of immigrants arriving in the United States, for the relief of such as are in distress, etc."*

By an Act of Congress, approved Aug. 3, 1882, it is provided that no convict, lunatic, idiot, or person "unable to take care of himself or herself without becoming a public charge," shall be permitted to land. Under the provisions of this Act it appears that from 1883 to Sept. 25, 1888, 7,764 immigrants had been returned from the United States to their own countries — or an average of about 1,300 persons a year. Of those thus returned from 1883 to 1888 inclusive, there were 27 convicts, 371 lunatics, and 131 idiots. The remainder (7,235 persons) were returned as "liable to become a public charge."†

Rules for immigrants.

The Public Lands.

The emigration from Europe and other countries consists largely of people seeking homes in the New World; and this want is chiefly supplied by the purchase of government land — "public lands," as usually designated by the authorities — that is, of such land as is offered for sale by authority of the General Government, under the direction of the General Land Office — a branch or subdepartment of the Department of the Interior. It is desirable, therefore, that the way in which the General Government came in possession of these lands should be briefly stated, and some idea given of their extent and position.

Extent and position.

The boundaries of the United States as fixed by the provisional treaty made with Great Britain in 1782, and by the definitive treaty in 1783, gave to the United States essentially the region south of the Great Lakes and east of the Mississippi, as far south as the parallel of 31°; and the southern boundary east of the Mississippi, as thus established, nearly along the 31st parallel, was, in 1795, reaffirmed by treaty with Spain, by which the line between the United States and the Floridas was fixed; but difficulties soon arose in regard to the northern boundary, both in its eastern and western portions, which were, during many years, the subject of heated discussion, and which more than once threatened to involve the two countries, Great Britain and the United States, in war. The most important points were, however, peaceably settled in 1846, and the last point in dispute finally disposed of, by reference to the Emperor of Germany as arbitrator, in 1872.

At the time of the adoption of the Constitution by the original thirteen States, most of them had claims, rather vague, and in many cases decidedly conflicting, to a more or less indefinite area of country west of their settlements, and extending back to the Mississippi River. After much discussion, the States having these claims, influenced by the distinct realization of the trouble which would ensue in case an attempt was made to maintain them, did, in response to a resolution of Congress, consent to a transfer of these claims to the United States. The first cession of this kind was that of New York, in 1781, and the last, that of Georgia, in 1802. The region thus ceded was divided into two territories, one of which was called the "Territory Northwest of the River Ohio," the other the "Territory South of the River Ohio." This region formed the nucleus of the public lands of the United States. This did not include the present States of Kentucky and Tennessee, the former having been admitted to the Union without any claim on the part of the United States to proprietorship in the soil, and similar rights in regard to the latter having been relinquished by Act of Congress. The total

*This tax is not collected from immigrants coming from Canada or Mexico.

†A very stringent Act was passed by Congress in 1885, prohibiting the importation and immigration of foreigners and aliens "under contract or agreement to perform labor in the United States, its Territories, and the District of Columbia." This Act can have little practical effect on the number of immigrants arriving in this country; nor has the writer been able to procure any definite information as to whether any persons have ever been sent back under its provisions.

area of the United States at this time was about 850,000 square miles. The first addition made to this was by the French cession of the undetermined area known as Louisiana. This was brought about by Jefferson, who recognized the fact that France would not be able to hold the region against the English, with whom Bonaparte, at that time (1803–1804) First Consul, was about to go to war. The treaty of cession with Bonaparte gave no precise limits to the territory ceded, but only described it as being the same as that ceded by Spain to France according to the treaty of San Ildefonso. This vagueness was, no doubt, agreeable to the wishes of the American negotiators, who did not lack foresight, and who must easily have comprehended the fact that the more vague the terms of the cession the better the chance of a future extension of the claims of the United States westward. In point of fact the French cession did not include the country west to the Pacific, as it was afterward held to do, for the French had no claim whatever to the region west of the head of the Missouri. As a consequence of this cession, however, this vast region did come into possession of the United States, the boundary having been finally settled in 1872, after ninety years of discussion. The final settlement was by a reference of the point in dispute to the Emperor of Germany, who decided in favor of the United States; the main question with regard to the extension of the boundary along the line of the 49th parallel to the Pacific, having been settled in 1846 by the Webster-Ashburton treaty, which fixed the boundary as far west as the Straits of Fuca. This cession of Louisiana, as finally settled by treaty with England, added largely to the area of the United States, extending its limits to the Pacific Ocean, and giving that country complete possession of the Central River system of the continent. The cost of this cession to the United States was about twenty-three and a half million dollars in principal and interest.

A further addition to the territory of the United States was by a cession from Spain of the territory comprised in the present State of Florida, which took place in 1819, the area thus conveyed being about 58,680 square miles, and the cost about six and a half millions of dollars. Previous to this cession, however, the United States had, by Act of Congress passed in secret session in 1812, but not promulgated until 1818, taken possession of an area of about 9,740 square miles in West Florida, which was claimed by the Spanish Government as its property, but which claim was relinquished by the cession of 1819.

The next acquisition of territory by the United States was the result of the admission into the Union of the Republic of Texas, a former province of Mexico, having an area of 265,780 square miles. This annexation led to a war with the country to which Texas had formerly belonged, the result of which was the conquest of Mexico, the occupation of its capital by the United States army, and the dictation of a treaty of peace called the "treaty of Gaudalupe-Hidalgo," which was proclaimed July 4, 1848. By this treaty the southern boundary of the United States was established; but subsequently, Dec. 30, 1853, a purchase was made of a strip of land lying south of the Gila River in New Mexico and Arizona, and containing about 47,330 square miles. This is known as the "Gadsden Purchase."

Claims of Great Britain and Mexico.

The claims of both Great Britain and Mexico to the region lying west of the Missouri and northwest of Texas being extremely vague, it is not possible to state, with any approach to precision, what portions of this area originally belonged to the two powers in question. All that can be said is that, remotely, in consequence of the purchase of "Louisiana" from Bonaparte, and more directly, as the result of treaties with Great Britain and Mexico, settling the northern and southern boundaries of the United States, the last-named country came into possession of a little over 1,800,000 square miles of land, as shown in the following statement of the nature and size of the areas added from time to time to what was the original domain of the Colonies at the time of their establishment as an independent government:

	Square miles.
Original area of the United States	849,145
Added by purchase of Florida, 1819, including 9,740 square miles previously in dispute, but in possession of the United States	58,680
Annexation of Texas, 1848	265,780
Gadsden Purchase, 1853	47,330
Purchase of Louisiana and cessions by Mexico, 1804–38	1,804,665
Total	3,025,600

One other addition to the area of the United States was made in 1867, namely, by the purchase from the Russian Government of the region known as Alaska, which comprises an area of about 530,000 square miles. The price paid for this piece of land was $7,200,000. The purchase of this territory, the nearest point of which is four hundred miles distant from the northern line of Washington, was an entirely unprecedented act on the part of the United States, all the rest of the possessions of this country forming one compact mass of land. Whenever, in the course of this work, mention is made of the United States, it will be understood that Alaska is not included, unless a statement to that effect is specially made in the same connection.

The entire area of the public lands of the United States (exclusive of Alaska, no portion of which has yet been surveyed) is estimated by the Commissioner of the General Land Office, in his report for the year 1886, at 2,836,725 square miles. or 1,815,504,147 acres. Of this area there had been surveyed, up to June 30, 1886, 971,174,878 acres, leaving 844,329,269 unsurveyed. In reference to this unsurveyed portion the Commissioner made the following remark: "The volume of land in the unsurveyed portion of the public domain suitable for homes and subject to settlement under the laws of the United States is of comparatively small proportions."

Of the public lands of the United States a large quantity has been sold for cash, and a much larger amount taken, under various Acts of Congress, for schools and other educational purposes; as military bounty; as "swamp land," given to the respective States where it occurs, or has been claimed to occur; as a bonus for the construction of various lines of railroad, especially those traversing the continent from east to west; as "homesteads" to actual settlers, and for various other purposes. It is impossible to state the exact amount of the public land which has been thus disposed of, but it is certain that nearly all the valuable portion of the nation's great inheritance has been taken up already, or has passed out of the control of the Government. In regard to this point the following quotation may be made from the introduction to the volume entitled "Statistics of Agriculture," forming a part of the report of the census of 1880, and published in 1883, the remarks here quoted being from the pen of General Walker, formerly superintendent of that census:

Valuable land already gone.

"It thus appears that, notwithstanding the imposing total of 1,400,000 square miles of still unsettled territory, the amount of land available for occupation for ordinary agriculture is not large. The Public Land Commission in their report of 1880, say: 'It was estimated June 30, 1879, that (exclusive of certain lands in Southern States) of lands over which the survey and disposition laws had extended, lying in the West, the United States did not own, of arable agricultural public lands, which could be cultivated without irrigation or other artificial appliances, more than the area of the present State of Ohio, namely, 25,566,960 acres. The quantity of land taken up in the arable region during the year ending June 30, 1880, was about 7,000,000 acres. The Commission, therefore, reaches the startling conclusion that, at the same rate of absorption, the arable lands

so situated will all be taken up within three years, or by June 30, 1883.'

"It is indeed an astonishing announcement that the public land system, so far as relates to agricultural settlers, has virtually come to an end; that the homestead and pre-emption acts are practically exhausted of their contents."

Professor A. B. Hart has compiled from public documents the following approximate statement of the manner in which the public lands had been disposed of up to the various periods mentioned. The numbers given indicate acres:

Date.	Sales.	Grants to individuals other than for internal improvements.	Grants to States other than for internal improvements.	Grants for internal improvements to States and Corporations.	Total.
To 1790	1,487,986	35,040	.....	.....	1,523,026
1801	1,574,917	2,154,660	.....	.....	3,729,577
1820-21	19,423,212	7,260,152	.....	.....	33,375,901
1841	93,043,927	9,765,033	8,830,654	1,780,505	113,420,119
1861	161,796,816	75,466,345	113,962,581	31,600,842	382,826,534
1881	181,837,359	140,524,032	158,187,194	162,230,099	642,778,684
1884	192,584,116	167,483,506	158,417,594	162,230,099	680,715,315

In reference to the wasteful and reckless manner in which the public lands of the United States had been given away, until but little of value remains, Professor Hart makes the following remarks:

"Experts in the Land Office assure us that, making all deductions and allowances, the remaining lands are worth upwards of a thousand million dollars. There is no evidence in the past policy of the government for believing that we shall actually net one-tenth of that amount. The greater part of the region is officially classified as 'desert lands,' and is for sale in tracts of six hundred and forty acres, at a dollar and a quarter an acre. Nothing but the temporary increase of pre-emption enables the Land Office at present to pay its running expenses out of income. The golden time is past; our agricultural land is gone; our timber lands are fast going; our coal and mineral lands will be snapped up as fast as they prove valuable." *

Agriculture.

The following statements and tables present a succinct view of the nature and importance of the agricultural interests of the United States, beginning with the cereals.

I.—The Cereals.

The following table shows the production of the cereals in bushels, as returned by the census of 1880:

	Production in Bushels.
Barley	44,113,495
Buckwheat	11,817,327
Indian corn	1,754,861,535
Oats	407,858,999
Rye	19,831,595
Wheat	459,479,505

Production of cereals.

The production of barley was largest in California (twelve and a half million bushels); other States producing considerable quantities were: New York, Iowa, Minnesota, Nebraska, Ohio. No other state produced as much as one million bushels. In 1886 the total production of barley in the United States was 59,428,000 bushels; of that amount California produced 16,038,000 bushels; and New York, Minnesota, Wisconsin and Iowa each over five million and less than ten million bushels; while Nebraska, Michigan and Dakota each produced over one million and less than five million bushels.

The total production of buckwheat within the United States, according to the census of 1880, was 11,817,327 bushels; of this amount New York and Pennsylvania produced respectively, 4,461,200 and 3,592,326 bushels. No other State produced as much as half a million bushels; the production of this cereal in the Gulf States being extremely small, that of the Pacific States being also very insignificant. No one of the States, other than New York and Pennsylvania, produced as much as half a million bushels.

In 1886 the total production of buckwheat was 11,809,000 bushels, or almost exactly the same as in the last census year (1879).

Indian corn is the most bulky crop among the cereals, the total yield as reported by the census of 1880 being 1,754,861,535 bushels. The principal production of this crop is in the belt of States lying north of the Ohio, and in the same latitude on the west of the Mississippi, as will be seen from the following table:

State.	Production in bushels in 1879.
Illinois	325,792,481
Iowa	275,024,247
Missouri	202,485,723
Indiana	115,482,300
Ohio	111,877,124

These five States produced, as will be seen, considably more than half the total yield of the country in the year for which the statistics are given. As we go north, south, east and west from this belt we find the yield of Indian corn diminishing. Still, this cereal is a product of importance even as far south as the Gulf States, but is of comparatively little consequence in New England, the total production of the six New England States in 1879 being only 8,376,133 bushels.

In 1886 the total yield of Indian corn was 1,665,441,000 bushels, and the States producing over one hundred million bushels each were:

State.	Production in bushels in 1886.
Illinois	209,818,000
Iowa	198,847,000
Missouri	143,709,000
Kansas	126,712,000
Indiana	118,795,000
Nebraska	106,129,000

Yield of Indian corn.

These six States produced in that year considerably more than half of the total, and the gradual advancement westward of the agricultural development of the country is shown in the appearance of Nebraska in the above column of figures as a producer of over a hundred millions of bushels. The yield of Indian corn in this State, according to the census of 1870, was 4,736,710 bushels, and in 1879 it had increased to 65,450,115 bushels. The figures for Dakota for the same years were 133,140 and 2,000,864 bushels.

Of this crop, so important as it is for home consumption, but a very small fraction is exported. The following table exhibits the total produce of the country for the years since the census year (1879) up to and including the year 1886, together with the percentage exported for each year:

Year.	Production in bushels.	Per cent. exported.
1880	1,717,434,543	5.5
1881	1,194,916,000	3.7
1882	1,617,025,100	2.6
1883	1,551,066,895	3.0
1884	1,795,528,000	2.9
1885	1,936,176,000	3.3
1886	1,665,441,000	2.5

The yield of corn in 1887 is given by the Department of Agriculture as 1,456,161,000 bushels, and that of 1888 is estimated at 1,987,790,000 bushels. Since 1879 the home consumption of this cereal has averaged about twenty-seven bushels per annum for each

* Quarterly Journal of Economics, vol. i. p. 181 (number for January, 1887).

inhabitant of the country; in the ten years preceding it averaged about twenty-five bushels.

The total yield of oats, as reported by the census of 1880, was 407,858,999 bushels. The distribution of this crop is pretty uniform all over the country, with the exception of the Gulf and Pacific Coast States, where the yield of this cereal is very small, barley taking the place of oats in California almost entirely.

The following table exhibits the production of oats in the United States from 1880 to 1888:

Year.	Production in bushels.
1880	417,885,380
1881	416,481,000
1882	488,250,610
1883	571,302,400
1884	583,628,000
1885	629,409,000
1886	624,134,600
1887	659,618,000
1888	701,735,000

The increase in the number of acres cultivated in oats since the census year has been very marked; more so than in the case of wheat or Indian corn. The average for the decade, 1870–79, was 11,000,000 acres; that for the years 1880–87 was 21,000,000 acres.

Rye.

The amount of rye grown in the United States as returned by the census of 1880 was 10,831,595 bushels; the principal States where this crop is raised being, in the order of their yield, Pennsylvania, 3,683,621; Illinois, 3,121,785; New York, 2,634,690; Wisconsin, 2,298,513; and Iowa, 1,518,605 bushels. The production of this cereal in the States south of Kentucky and Virginia is extremely small, but some rye is given as grown in every State and Territory, except Arizona and Nevada. The production of rye in 1886 was 24,489,000 bushels; Kansas appearing this year as a producer of a little over two million bushels, and Nebraska of nearly one million.

Wheat.

Wheat is an extremely important crop in the United States, and is the only cereal of which the export is considerable. The great wheat-growing States are those along the north side of the Ohio, from New York westward and across the Mississippi into Iowa, Kansas and Northwest, including Nebraska, Minnesota and Dakota. The yield of the census year (1879) was 459,479,505 bushels. In that year, Illinois, Indiana, Ohio, Michigan, Minnesota and Iowa each produced over thirty million bushels; the total yield of those six States was somewhat more than half that of the whole country. In 1887 the total was very nearly the same (456,329,000 bushels), but the distribution of this yield was somewhat different. There were in that year also six States producing each more than thirty million bushels. Of these six, four are among those included in a similar category for the year 1879. Michigan and Iowa have dropped out of that list, and Dakota and California must be inserted in their places.* These six States, as before, produce almost exactly half the entire yield of the country. What is more remarkable is, that Dakota, which in 1879 only figured with a produce of 2,830,289 bushels, appears in 1887 as furnishing no less than 52,406,000 bushels, or more than one-tenth of the whole crop of this cereal. Other States of importance in 1887 were Missouri, Iowa and Michigan, each of which produced between twenty and thirty millions of bushels; and Nebraska, Oregon, Pennsylvania, Wisconsin, Kentucky and New York, each of which produced between ten and twenty millions of bushels.

In the tabular statement of the yield of wheat for the year 1887, as given by the Department of Agriculture, forty-two States and Territories appear as producing more or less of this cereal, but the quantity grown south of Kentucky and Virginia is very small. The yield of the Gulf States is entirely insignificant, Florida and Louisiana not appearing at all in the list; and that of New England is equally unimportant, the whole produce of that section of the country being in that year only 74,547 bushels.

The following table gives the production of wheat, total value, value per bushel, and amount exported for each of the years, 1880–87:

Year.	Total production. (Bushels.)	Total value of crop.	Av. value per bushel. (In cents.)	Amt. exported. (Bushels.)
1880	498,549,868	$474,201,850	95.1	186,321,514
1881	383,280,090	456,880,427	119.3	121,892,389
1882	504,185,470	444,602,125	88.2	147,811,316
1883	421,086,160	383,649,272	91.0	111,534,182
1884	512,765,000	330,862,260	64.5	132,570,367
1885	357,112,000	275,320,390	77.1	94,565,791
1886	457,218,000	314,226,020	68.7	153,804,970
1887	456,329,000	310,612,960	68.1	.....
Average	448,815,699	373,794,413	83.3	135,500,076

The estimate of the Agricultural Department of the yield of wheat for the year 1888 is 415,868,000.

The grass crop is well understood to be the greatest of all the crops of the United States. Altogether, in addition to the very large amount consumed from the ground during the grazing season, the value of the harvested hay reaches nearly to that of the greatest of the cereal crops. The following statistics are presented:

The area mown in 1879 was 30,631,054 acres; in 1886, 36,501,688 acres. The value of the hay cut in the latter year was $353,437,699.* In one State (New York) the value amounted to over fifty millions of dollars; in one (Pennsylvania) to over thirty and less than forty millions, in three States (Illinois, Ohio, and Iowa), to over twenty and less than thirty millions.

The grass and hay producing industry decreases in importance as we go from the North toward the South. Thus, the thirteen States, in each of which (in 1879) more than a million of acres were mown are all north of the parallel of 37°; and all but two (Missouri and Kansas) north of 39°, excepting very small fractions of Ohio, Indiana, and Illinois.

The number and value of the animals on farms in the year 1886 was as follows:

	Number.	Value.
Horses	13,172,936	$946,096,154
Mules	2,191,727	174,853,563
Milch cows	14,856,414	366,252,173
Oxen and other cattle	34,378,363	611,750,520
Sheep	43,544,755	89,279,926
Hogs	44,346,525	220,811,082

The importance of the crop of Indian corn has given a great development to the business of fattening swine, and an average of about fifteen per cent. of this production has, during the past twenty-seven years, been exported. The average value of "hog products" (live hogs, bacon, hams, pork and lard) exported, has been during the years 1881–87, $73,671,607 per annum, as against $65,136,498 in the decade 1871–80.

The statistics of dairy products given in the Agricultural Report of the Census of 1880 for the year 1879 are presented in a very condensed form, as follows:

Milk sold, or sent to butter and cheese factories	530,129,755 gals.
Butter made on farms	777,250,287 lbs.
Cheese made on farms	27,272,489 lbs.

The very great extent and importance of the poultry industry in the United States is made apparent by the following statement of facts gathered by the census of 1880:

Barnyard poultry on hand, June 1, 1880	102,272,135
Other poultry on hand June 1, 1880	23,235,187
Eggs produced in 1879	456,910,916

At twelve cents a dozen, the annual value of the egg product to the farm would reach nearly $55,000,000,

*The yield of California remained nearly the same in 1887 that it was in 1879. In the former year it was a trifle over thirty millions; in the latter a trifle under that amount.

*This includes only hay cut on farms, and not that cut on public lands and lands of non-residents.

and the value of the fowls consumed as food may fairly be estimated at $20,000,000. The average yield of eggs per fowl is fully twice as great in the Northern States as it is in the Southern.

Cotton. The cotton production of the United States is of great importance, both from the extent to which this material is manufactured within the country, and because it is the first on the list in value among the exports.

Cotton is mentioned in the records of the Colony of South Carolina as early as 1664, and a small quantity was exported in 1747. The invention of the cotton-gin by Eli Whitney, in 1794, was followed by a rapid development of the cotton-raising business throughout the Southern States. The first crop of sea-island cotton was raised in 1790, from seed that came either from the Bahama or Barbadoes Islands.

The total production of the country in the year 1879 is given by the census of 1880 at 5,737,257 bales, of 375 pounds; this having been assumed to be the weight of the bail, in 1879 — the average proportion of seed to fibre, or lint, in the crop as it comes from the field being given as two to one. The stated number of bales is equivalent, therefore, to 1,362,599 tons (of 2,000 pounds) of lint or fibre, and 2,725,197 of seed.

This production was divided among the States as follows:

	Field.	Av. Product per acre.
	Bales.	Fraction of bale.
Mississippi	955,808	0.46
Georgia	814,441	0.31
Texas	803,642	0.37
Alabama	699,654	0.30
Arkansas	608,256	0.58
South Carolina	522,548	0.38
Louisiana	508,569	0 59
North Carolina	389,598	0.44
Tennessee	330,644	0.46
Florida	54,997	0.22
Missouri	19,733	0.60
Indian Territory	17,000	0.49
Virginia	11,000	0.46
Kentucky	1,367	0.51
Total	5,737,257	gen. av. 0.40

From the above table it will be seen that the limit of profitable cultivation of cotton is pretty sharply drawn at about the parallel of 37°; the production of Virginia and Kentucky — the southern border of which States is in the latitude 36° 30′ — being exceedingly small. The production of Missouri is limited to a highly fertile region lying in the extreme southeastern portion of the State; while that of Kentucky pertains to the country lying adjacent to western Tennessee and the rich bottom-lands along the Mississippi River. It does not appear that any cotton is produced north of the Ohio River.

According to Professor E. W. Hilgard, Special Agent of the Census of 1880, in charge of the subject of Cotton Production, the high production of Mississippi is due in part to the great fertility and large area of the "bottom-land" along the Mississippi River within the limits of that State, and in larger part to the fertility of the "uplands," or table-land bordering the Mississippi bluff, and the interior "prairie-belts." These favorable conditions have as a result that cotton culture is the one pursuit to which the population of this State devotes itself. It is rather great natural advantages than skill and industry which give Mississippi the first place in the production of cotton. Professor Hilgard thinks that by enlarging the area of tillable land in the Yazoo bottom, by simple exclusion of the overflows of the Mississippi, without any change in the methods of culture, the produce of the State might be raised to two and a quarter millions of bales; and that with improved cultivation the production might be brought up to five millions, so that under these conditions Mississippi alone could produce the entire crop now grown in the United States.

Georgia stands second in total production among the States, but the average production per acre is but two-thirds that of Mississippi. The area of what would be called in the last-named State first and second class cotton soil is in Georgia quite limited — far more so than is the case in the neighboring State of Alabama; yet the former State is slightly in advance of the latter in the average product per acre. The high position of Georgia as a cotton-producing State is due therefore, not to natural advantages, but to better cultivation of the soil, the use of fertilizers, and the thrift of an industrious population.

Georgia as a cotton-producing State.

Texas — much the largest in area of the cotton-producing States, and also slightly larger in population than any of the other Gulf States — stands third on the list of total production. In the average product per acre it is among the very lowest. This fact seems to be due, in large part at least, to the position of Texas in reference to precipitation. In this State the total amount of rainfall is considerably less than in the other Gulf States, owing to its position in reference to the prevailing winds; and the diminution of rainfall is rapid as we recede from the coast. The precipitation is largest in the extreme northeastern portion of the State, and here — north of the 32d parallel and east of the 98th meridian — more than half the cotton product of the State is grown. The fact that Texas is so much larger than the other cotton-producing States must also be borne in mind in connection with its position as the third on the list. It has, in fact, an area more than five times as great as the average area of the six other principal cotton States.

Texas.

Alabama is naturally as well suited for the growth of cotton as the two States adjacent to it on the east and west, Georgia and Mississippi; and its position as fourth on the list, and as inferior to both these States, is considered by Professor Hilgard to be due to the fact that Mississippi is still within the period of the first flush of fertility, while Georgia has reached the stage where her fields are being renovated by the use of fertilizers; while the soil of Alabama has begun to be exhausted, but this exhaustion has not yet proceeded so far that the cultivators realize the necessity of making good this deficiency by proper modes of cultivation, as is done to a certain extent in Georgia.

Alabama.

In South and North Carolina the average cotton production per acre is high as compared with that of Alabama and Georgia, and in the case of North Carolina approaches that of Mississippi itself. The reason for this condition of things is to be found chiefly in the introduction of improved methods of culture, and the use of fertilizers. In South Carolina the so-called sea-island cotton is produced — a variety of cotton of great value, although small in amount, the production of it for the year 1880 being set down in the Census Report as 9,966 bales. The finest cotton ever known to have been produced is the long staple cotton of Edisto Island, which sold for two dollars a pound when other cottons were only bringing nine cents. The islands where this crop is grown line the coast sometimes forming three or four parallel belts, having their greatest development at the mouth of Broad River, from which in each direction along the coast they diminish in numbers.

South and North Carolina.

All the important cotton-producing States with the exception of Arkansas and Tennessee, lie either on the Gulf of Mexico or the Atlantic coast; but the principal cotton-producing areas in the case of each of these States are at a considerable distance from the coast. Thus, in Mississippi by far the greater portion of the area planted in cotton lies in the northern and western part of the State, while in the extreme south there is an area where cotton culture is either very subordinate or practically non-existent; nor is this decrease of cotton culture accompanied by a corresponding increase of some other production. In Louisiana an obvious fact — rendered apparent by a glance at the map showing the relative areas given to cotton culture in the State — is the decrease of cotton culture as we advance southward. In Alabama the central prairie region, or black-soil belt, a narrow strip of country only about twenty-five miles wide, running east and west through the centre of the

State, more than a hundred miles from the coast, produces forty per cent. of the entire cotton crop. Adjacent to this particularly rich belt on the north and south is a belt of less but still large productiveness, making the total width of the central cotton belt about seventy-five miles; and here at least sixty per cent. of the cotton of the State is raised. In Georgia the principal cotton producing belt runs nearly parallel with the coast, and at a distance of from one hundred to one hundred and fifty miles from it. A similar condition of things is clearly indicated in both North and South Carolina.

On comparing the facts here stated with the position of the isothermal and isohyetal curves in the region where cotton is grown, it will be seen that nearly the entire production of cotton comes from the area included between the isothermals of 60° and 68°, and there is none cultivated in any region of lower mean annual temperature than 56°. It also appears that the cotton-producing area is one of comparatively large precipitation, being nowhere less than thirty-eight inches, and generally considerably over that amount; and also that this precipitation is pretty uniformally distributed throughout the year. From this it is seen that the climatic conditions favoring the growth of cotton are of such a nature as to limit its successful production to a comparatively small area, differing in this respect materially, from some of the other staples of the country, especially Indian corn and wheat. It will also be evident that the conditions existing on the Pacific coast do not favor the successful cultivation of cotton in that region.

The following table exhibits the production of cotton and the amount exported for each year from 1880 to 1887. The average annual yield during the twenty years previous to 1861 was 1,335,000,000 pounds; during the twenty-two years from 1865 to 1886 it was 2,207,000,000 pounds—an increase of 65.3 per cent. During the pentad 1883–87 the average was 2,036,345,355 pounds, or a little less than the average of the years 1865 to 86:

Year.	Production in Pounds.	Exports in Pounds.
1880	3,199,822,682	2,190,928,772
1881	2,588,286,636	1,739,975,961
1882	3,405,070,410	2,208,075,062
1883	2,757,544,422	1,862,572,530
1884	2,742,966,011	1,891,659,472
1885	3,182,350,531	2,058,037,414
1886	3,157,378,443	2,169,457,330
1887*	3,300,000,000	2,200,000,000

*Approximate.

The climatic conditions under which tobacco can be raised seem to be quite variable, since more or less of this crop is furnished by almost every State in the Union. The yield of the extreme Southern and extreme Northern States is, however, very small: as (in 1879), of Maine only 250 pounds; of Oregon, 17,325; of New Mexico, 890; of Louisiana, 55,954.

Kentucky largest tobacco producing State.

The largest tobacco-producing State is Kentucky, with 171,120,784 pounds in 1879, according to the census of 1880. Next comes Virginia, with 79,988,868; then Pennsylvania, 36,943,272; Ohio, 34,735,235; Tennessee, 29,365,052; North Carolina, 26,986,213; Maryland, 26,082,147; Missouri, 12,015,657; Wisconsin, 10,608,423. From this it is evident that the culture of tobacco is carried on most successfully in the Middle Atlantic States and those bordering on the Ohio River, diminishing gradually in this latitude westerly, and having no importance in the extreme Western States. The mean temperature of the chief tobacco-producing area is indicated by the statement that it lies between the isothermals of 52° and 60°. As regards precipitation, a somewhat moist climate seems to be required, and there is little tobacco raised where the rainfall averages less than thirty-eight inches. The isothermal of thirty-two inches seems to be the limit beyond which it cannot pass. The total yield of the United States in the year 1879 was 472,661,159 pounds, having an estimated value as raised in the producers' hands, of $51,104,870.

The production of tobacco in 1886 was about eleven per cent. larger than in 1879—namely, 532,537,000 pounds. The relative rank of the States in the production of this crop was almost exactly the same at the two periods. Kentucky and Virginia together furnished in 1886 more than half the total, or 285,104,000 pounds. The entire value of the tobacco raised in 1886 was $39,468,218.

The production of rice for the year 1879 as returned by the census of 1880 was as follows:

	Pounds.	Average yield per acre.
Alabama	810,889	514
Florida	1,294,677	508
Georgia	25,369,687	725
Louisiana	23,188,311	552
Mississippi	1,718,951	491
North Carolina	5,609,191	517
South Carolina	52,077,515	664
Texas	62,152	186
Total	110,131,373	gen. av. 632

The production of sugar from the sugar-cane is extremely small as compared with the consumption of this article. Louisiana is the only State of any importance in this connection, although a small quantity of sugar is made in each of the following States: Georgia, Florida, Texas, Alabama, Mississippi and South Carolina. The total production in the year 1879, as returned by the census of 1880, was—of sugar, 178,872 hogsheads, and of molasses, 16,573,273 gallons, of which Louisiana furnished 171,706 hogsheads and 11,696,248 gallons.

The census of 1880 gives the following statistics of the production for that year of sugar and molasses from sorghum and the maple:

	Sugar.	Molasses.
Sorghum	12,792 lbs.	28,444,202 gals.
Maple	36,576,061	1,796,048

The principal production of sorghum molasses is in the States of Missouri, Tennessee, Kentucky, Illinois, and Iowa; that of maple sugar, in Vermont, and New York, in each of which States the produce was over 10,000,000 pounds.

The following additional facts in regard to the agriculture of the United States are condensed and arranged from the volume entitled "Statistics of Agriculture," in the Census Report for 1880.

	1870.	1880.
Total number of farms	2,659,985	4,008,907

The term "farm," as here used, is understood to mean a tract of not less than three acres, unless $500 worth of produce has actually been sold off from it during the year, and owned or leased by one man and cultivated under his care:

Total area of United States in acres	1,856,108,800
Number of acres in farms	536,081,835

	1860.	1870.	1880.
Proportion of unimproved land in farms to improved, in percentage	59.9	53.7	46.9

Of the 4,008,907 farms returned, 74 per cent. were cultivated by their owners, 8 per cent. by tenants on basis of fixed money rental, and 18 per cent. by tenants paying a share of the product or rent.

The total value of the farms of the United States, including land, buildings and fences, is given by the census of 1880 at $10,197,096,776; and the estimated value of all farm productions sold, consumed, or on hand, in 1879, was $212,540,927.

Tabular statement.

The following tabular statement, from the volume of the Census Report of 1880, entitled "Statistics of Agriculture," and published in 1880, presents a resume of the principal facts connected with the agricultural interests of the country, so far as concerns the amounts or values of the different products:

Condensed Tabular View of Agricultural Products Chiefly in the year 1879, *arranged from the Census Report, Volume entitled "Statistics of Agriculture," Published* 1883.

Number of farms	4,008,907
Value of farms, including land, fences, and buildings	$10,197,096,776
Estimated value of farm products for 1879	$2,212,540,927

Wool produced	240,681,751	pounds
Milk (not including that sent to butter or cheese factories)	530,129,755	gallons
Butter (including that made on farms and in factories)	806,672,071	pounds
Cheese (made on farms and in factories)	243,157,850	"
Barley	43,997,495	bushels
Buckwheat	11,817,327	"
Indian corn	1,754,591,676	"
Oats	407,858,999	"
Rye	19,831,595	"
Wheat	459,483,137	"
Cotton	5,755,359	bales
Flaxseed	7,170,951	bushels
Flaxstraw	421,098	tons
Flax fibre	1,565 546	pounds
Hemp	5,025	tons
Sugar (sugar-cane)	178,872	hhds.
Molasses (sugar-cane)	16,573,273	gallons
Sugar (sorghum)	12,792	pounds
Molasses (sorghum)	28,444,202	gallons
Sugar (maple)	36,576,061	pounds
Molasses (maple)	1,796,048	gallons
Hay mown	35,150,711	tons
Clover-seed	1,922,982	bushels
Grass-seed	1,317,701	"
Eggs	456,910,916	dozen
Honey	25,743,208	pounds
Wax	1,105,689	"
Rice	110,131,373	"
Tobacco	472,661,157	"
Potatoes, Irish	169,458,539	bushels
Potatoes, sweet	33,378,693	"
Orchard products (sold or consumed)	$50,876,154	
Market-garden products	$21,761,250	
Hops	26,546,378	pounds
Broom corn	29,480,106	"
Peas	6,514,977	bushels
Beans	3,075,050	"
Wood, amount cut	51,442,624	cords
Forest products, value of all consumed or sold	$95,774,735	

The following general summary presents in one table the estimated quantities, number of acres cultivated, and aggregate value of the principal crops of the country in the year 1886:

Products.	Quantity.		No. of Acres.	Value.
Indian corn	1,665,441,000	bushels	75,694,208	$610,311,000
Wheat	457,218,000	"	36,806,184	314,226,020
Rye	24,489,000	"	2,129,918	13,181,330
Oats	624,134,000	"	23,658,474	186,137,930
Barley	59,428,000	"	2,652,957	31,840,510
Buckwheat	11,869,000	"	917,915	6,465,120
Potatoes	168,051,000	"	2,287,136	78,441,940
Total	3,010,630,000	bushels	144,146,792	$1,240,603,850
Tobacco	532,570,000	pounds	750,210	39,468,218
Hay	41,796,499	tons	36,501,688	353,437,699
Cotton	6,445,864	bales	18,454,603	257,295,327
Grand total			199,853,293	$1,890,805,094

Manufactures.

The most important facts connected with the manufacturing interests of the United States, as revealed by the census of 1880 and those of the preceding decades, may be stated, in the most condensed form, as follows:

First, a table is given showing certain of the principal items connected with manufactures in the form of totals for the whole United States, for the three census years 1860, 1870, and 1880:

Tabular Statement of Manufactures in the United States.

	1860.	1870.	1880.
Number of establishments	140,433	252,148	253,852
Capital invested	$1,009,855,715	$2,118,208,769	$ 2,790,272,606
Average number of hands employed—			
Males above 16 years		1,615,598	2,019,035
Females above 15 years		323,770	531,639
Children and youths		114,628	181,921
Total amount paid in wages during the year	$ 378,878,966	$ 775,584,343	$ 947,953,795
Value of materials used	1,031,605,092	2,488,127,242	3,396,823,549
Value of products	1,885,861,676	4,232,325,442	5,369,579,191

The proportion in which the various branches of manufacture are geographically distributed over the country, according to the census of 1880, is shown by the following percentage statement:

Table of Geographical Distribution of Manufactures in the United States.

	Proportion of total Area.	Number of Establishments.	Amount of Capital invested.	Hands Employed.	Wages Paid.	Gross Product.
N. Atlantic	5.6	44.87	61.94	62.23	64.33	59.64
S. Atlantic	9.4	10.16	5.89	7.59	4.99	5.26
N. Central	25.5	34.33	25.78	24.39	24.86	28.94
S. Central	20.3	7.55	3.75	3.85	3.11	3.47
W. (Cordilleran)	39.4	3.09	2.64	1.94	2.71	2.69

Next may follow a statement of the various most extensive manufacturing industries arranged in the order of their importance, with reference to the value of their products. In this table all branches of manufacture are included in which the total production exceeds $40,000,000 in value:

Table of Individual Manufacturing Industries in the United States, According to the Census of 1880.

Products.	Number of establishments.	Number of hands employed.
Flouring and grist mill products	24,338	58,407
Slaughtering and meat packing	872	27,297
Iron and steel	1,005	140,978
Woolen of all classes	2,689	161,557
Lumber, sawed	25,708	147,956
Foundry and machine shop products	4,958	145,357
Cotton goods	1,005	185,472
Clothing, men's	6,166	160,813
Boots and shoes	17,972	133,819
Sugar and molasses, refined	49	5,857
Leather, tanned	3,105	28,812
Liquors, malt	2,191	26,220
Carpentering	9,184	54,138
Printing and publishing	3,467	58,478
Furniture	5,227	59,304
Leather, curried	2,319	11,053
Agricultural implements	1,943	39,580
Mixed textiles	470	43,373
Bread and other bakery products	6,396	22,488
Carriages and wagons	3,841	45,394
Tobacco, cigars, etc	7,145	53,297
Paper	692	24,422
Tobacco, chewing, smoking and snuff	477	32,756
Tin ware, copper ware, and sheet-iron ware	7,595	26,248
Blacksmithing	28,101	34,526
Liquors, distilled	844	6,502
Silk and silk goods	382	31,337

Products.	Amount paid in Wages.	Value of Materials.	Value of Products.
Flouring and grist mill products	$17,422,316	$441,545,225	$505,185,712
Slaughtering and meat packing	10,508,530	267,738,902	303,562,413
Iron and steel	55,476,785	191,271,150	296,557,685
Woolen of all classes	47,389,087	164,371,551	267,252,913
Lumber, sawed	31,845,974	146,155,385	233,268,729
Foundry and machine shop products	65,982,133	103,315,083	214,378,468
Cotton goods	45,614,419	113,765,537	210,950,383
Clothing, men's	45,940,353	131,363,282	209,548,460
Boots and shoes	50,995,114	114,966,575	196,920,481
Sugar and molasses, refined	2,875,032	144,698,499	155,484,915
Leather, tanned	9,201,243	85,949,207	113,348,336
Liquors, malt	12,198,053	56,836,500	101,058,385
Carpentering	24,582,077	51,621,120	94,152,139
Printing and publishing	30,531,657	32,460,395	90,789,341
Furniture	23,695,080	35,860,206	77,845,725
Leather, curried	4,845,413	59,306,509	71,351,297
Agricultural implements	15,359,610	31,531,170	68,640,486
Mixed textiles	13,316,753	37,227,741	66,221,703

Products.	Amount paid in Wages.	Value of Materials.	Value of Products.
Bread and other bakery products	9,411,328	42,612,027	65,824,896
Carriages and wagons	18,988,615	30,597,086	64,951,617
Tobacco, cigars, etc	18,464,562	29,577,833	63,979,575
Paper	8,525,355	39,951,297	55,109,914
Tobacco, chewing, smoking and snuff	6,419,024	34,397,072	52,793,056
Tin ware, copper ware and sheet-iron ware	10,722,974	25,232,281	48,096,038
Blacksmithing	11,126,001	14,572,353	43,774,271
Liquors, distilled	2,663,967	27,744,245	41,063,663
Silk and silk goods	9,146,705	22,467,701	41,033,045

The remarkable concentration of the manufacturing interests of the United States in the extreme northeastern portion of the country will be evident from the above table. New England, New York, New Jersey, and Pennsylvania, embracing only a little over one-twentieth of the area of the whole country, produce six-tenths of the total gross product of its manufactures. Similar conditions are shown in contrasting the northern with the southern sections of the country. The North Atlantic and North Central divisions, with thirty-one per cent. of the total area, furnish over eighty-eight per cent. of the gross product. The Western or Cordilleran region, with nearly forty per cent. of the total area of the country, furnishes only a little over two and a half per cent. of its manufactures.

The Census Report of 1882 gives a great mass of statistics in reference to the manufacture of cotton in the country, from which the following are selected as representing the most essential features of this extremely important business:

Number of spindles	10,653,435
Number of looms	225,759
Bales of cotton consumed	1,570,344
Number of persons employed	172,544
Wages paid	$42,040,510

These are said to be the final figures of the specific manufacture of cotton yarn and woolen fabrics, including some cotton hosiery; and by the term "specific" is meant cotton "worked into a fabric known and sold under that name."

Including the cotton used in mixed goods and upholstery, the total consumption is estimated at 1,760,000 bales. The total number of operatives employed, including those engaged in print and dye works and bleacheries, and also in manufacturing special fabrics in which cotton forms a part, is 198,338. The operatives employed in the specific cotton mills are thus classed as to age and sex:

Men	59,685
Boys	15,107
Women	84,539
Girls	13,213
Total	172,544

The average wages earned in the cotton mills amount, for 300 days in the year, to 81 cents per day. Since 1840 the hours of labor have been reduced from 13 or 14 to 10 or 11, and the average earnings per hour are now more than double what they were at that time.

The manufacture of cotton is carried on in nearly all the Atlantic, Central, and Southern States, but is principally developed in and near Massachusetts. This State alone consumed considerably more cotton in 1880 than all the other States outside of New England. Of 1,570,344 bales consumed in "specific" cotton manufacture in the country, in 1880, 1,229,498 were taken by New England. Massachusetts and Rhode Island, having together about ten thousand square miles of area, consumed 742,337 bales, or nearly half the whole consumption of the United States.

Some cotton cloth is still made by hand in the mountainous sections of the south, some two or three hundred thousand persons being supplied in this way.

RELATIONS OF WAGES AND MATERIALS TO PRODUCTS IN MANUFACTURING AND MECHANICAL INDUSTRIES.*

Class.	Number of Hands Employed.	Amount paid in Wages.	Value of Materials.	Value of Products.	Excess of Products over Materials.	Excess of Products over Wages and Materials.	Wages in $100 of Products.	Materials in $100 of Products.	Wages and Materials in $100 of Products.	Product, per capita, gross.	Product, per capita, deducting Materials.
1880.											
I.	123,787	$ 46,972,802	$ 64,875,494	$ 164,523,518	$ 99,648,024	$ 52,675,222	$28.55	$39.43	$67.98	$1,329.08	$894.99

Total	2,009,739	$762,296,747	$2,417,096,348	$4,117,556,551	$1,700,460,203	$938,163,456	$18.51	$58.70	$77.21	$2,048.80	$847.11

*All the industries tabulated were assigned entire to one class or another, according to the principles indicated in the text. The lines of division taken for the second, third, and fourth classes were: (1) where the value of the materials is less than two-fifths of that of the ultimate product; (2) where the value of the materals is from two-fifths to four-fifths of that of the ultimate product; and (3) where the value of the materials is over four-fifths of that of the ultimate product.

†In this table the same groups of industries in 1870 are compared with each other. The table differs from that contained in the volume on Manufactures of the Ninth Census and in the Compendium of that census in this, that the mining and fishing interests, and the statistics of a few industries which form the subject of special reports in the census of 1880 are, for purposes of comparison, excluded herefrom.

The following table will furnish the necessary data for an understanding of the importance of the petroleum business in the United States:

Year ending June 30.	Production in Barrels of 42 Gallons.	Exports, in Gallons.			Total Value of Exports.
		Illuminating Oil.	Crude Oil.	Total.	
1864	2,478,709	12,791,518	9,980,654	23,210,369	$10,782,689
1865	2,424,905	12,722,005	12,293,897	25,496,849	16,563,413
1866	3,165,700	34,255,921	16,057,943	50,987,341	24,830,887
1867	3,591,905	62,686,657	7,344,248	70,255,481	24,407 642
1868	3,613,709	67,909,961	10,029,659	79,456,888	21,810,676

1887	25,816,000	480,845,811	76,062,875	592,803,267	46,824,933
1888	28,249,597	456,417,221	85,538,725	578,351,638	47,042,409

Industries. The relation of materials to product, in the statistics of industry, needs to be carefully borne in mind; and for the purpose of throwing light on this subject, the Census Report of 1880, in the volume devoted to manufactures (published in 1883) groups the manufacturing and mechanical industries into four classes, as follows: I. Those industries in which the subject-matter is of a distinct and immediate commercial value, but the property does not reside in the person who treats it; II. Those industries in which the entire value of the subject-matter is carried into the value of "materials," and appears again in the product, enhanced by the value of labor, use of capital, rent, freight, etc., but in which the value is small compared to the cost of labor; III. Industries which are otherwise under the same conditions as those of the second-class, but in which the value of the materials approaches, or even moderately exceeds, the value of the labor employed, and becomes thus an important element in the final value of the product, enhancing the apparent production of the industry in a high degree; and IV. Industries in which the value of the materials far exceeds all other elements in the cost of production combined, although, in fact, comparatively little value has been added by these operations, and only a small number of artisans or laborers supported. The table on preceding page is intended to illustrate the relation of materials to product, indicated above.

VALUES IN DOLLARS OF THE PRODUCTS OF DOMESTIC AGRICULTURE EXPORTED FROM THE UNITED STATES FOR THE YEARS 1886, 1887 AND 1888.

	1886.	1887.	1888.
Animals	12,518,660	10,598,362	12,885,000
Animal oils	718,654	810,670	924,136
Provisions, including meat and dairy products	90,625,216	92,783,296	93,058,705
Breadstuffs	125,846,558	165,768,662	127,191.687
Fruits	3,308,308	2,669,965	3,510,208
Seeds	1,919,990	1,907,409	1,516,690
Textiles, unmanufactured	205,561,916	206.300.059	223,022,032
Vegetable oils and oil-cake	9,255,170	9,011,451	8,458,608
Tobacco leaf	27,158,457	25,948,277	21,936,084
All other agricultural products	8,011,666	7,275,647	8,356,746
Total value of agricultural products	484,954,595	523,073,798	500,840,086
Total value of all exports of domestic merchandise	665,964,852	703,022,923	683,862,104
Percentage value of agricultural products	73.82	74.40	73.23

From a comparison of the facts given in the various tables herewith presented, it will be evident that, with the exception of those items called "manufactures" in the Census Reports which are not properly manufactures, but the conversion of articles of food into a more suitable and convenient form for shipment to foreign countries — as, for instance, slaughtering of animals, and grinding and packing of wheat in barrels — the manufactures of the United States are intended and used for home consumption. The amount of these exported is very small as compared with the total of the exports. There is no one manufactured article of which the United States has anything like a monopoly abroad, or which greatly predominates in importance as an article of export over any other article.

The following data, compiled from the reports of the Bureau of Statistics, will give a sufficiently complete and comprehensive view of the nature of the imports into the United States.

The imported articles, including those admitted free of duty and the dutiable, are thus classified:

A. Articles of food and live animals.
B. Articles in a crude condition which enter into the various processes of domestic industry.
C Articles wholly or partially manufactured for use, as materials in the manufactures and mechanic arts.
D. Articles manufactured ready for consumption.
E. Articles of voluntary use, luxuries, etc.

The following table gives the amount in value of each of these classes imported during the years 1884 and 1885, and the average for the five years (1881–85); also the ad valorem rate of duty on the dutiable articles of each class, and the percentage relation of the ad valorem duty to the entire duty collected:

Year.	1884 and 1885.				Average of Years 1881–85.			
	Free of Duty.	Dutiable.	Ad Valorem Rate on Dutiable.	Per Cent. of Total Duty.	Free of Duty.	Dutiable.	Ad Valorem Rate on Dutiable.	Per Cent. of Total Duty.
1884 A	$92,589,286	$132,136,969	44.75	31.15	$86,851,648	$130,072,238	44.90	29.47
1885	86,559,991	107,706,369	57.28	34.79	86,066,234	129,907,732	46.41	30.57
1884 B	94,039,567	44,457,174	26.82	6.28	97,895,975	54,358,668	29.96	8.21
1885	82,507,747	37,101,595	25.48	5.33	95,001,401	49,163,935	28.57	7.12
1884 C	12,186,427	69,774,216	26.48	9.73	11,719,623	66,492,197	29.42	9.87
1885	11,185,487	61,045,053	27.88	9.61	11,850,883	66,169,652	29.01	9.73
1884 D	11,035,112	123,205,489	47.54	30.86	10,207,857	135,602,292	47.22	37.31
1885	10,617,405	108,636,576	48.28	29.58	10,504,966	133,155,050	47.52	32.08
1884 E	1,429,873	86,721,276	48.12	21 98	1,199,322	78,128,835	51.09	20.14
1885	2,041,604	72,178,227	50.84	20.69	1,453,551	79,690,207	50.69	20.49
Total 1884	$211,280,265	$456,195,194	Av. 41.61	100.00	$207,904,425	$464,631,230	Av. 42.06	100.00
" 1885	192,912,234	386,667,820	45.90	100.00	204,877,035	458,086,570	43.05	100.00

UNIVERSALIST CHURCH,[1] a religious body in the United States of America, especially in the New England States, which has for its distinguishing tenet the doctrine of the final salvation of all souls from sin through Christ. The pioneers of Universalism in America were Dr. George De Benneville, who taught from 1741 principally in Pennsylvania; Dr. Charles Chauncy, of the First Church, Boston (notably in *The Salvation of All Men*, published in 1784); Dr. Joseph Huntington, of Coventry, Conn. (whose *Calvinism Improved* was published after his death in 1796); John Murray, Elhanan Winchester, Caleb Rich, and, very specially, Hosea Ballou. Murray is, however, regarded as "the father of Universalism in America." In 1750 James Relly had avowed himself a Universalist, basing his belief on a theory quite peculiar; Murray, who had preached as a Methodist in England and Ireland, was Relly's most distinguished convert. In 1770 he came to America, and, under circumstances so strange that most Universalists regard them as providential, overcoming a deep reluctance, he preached at Good Luck, New Jersey, and organized a society, "The Independent Christian Church," at Gloucester, Massachusetts. Hosea Ballou —a convert from the Calvinist Baptists—took up the cause in 1790, and published the work that is regarded by Universalists as epoch-making, *A Treatise on Atonement*. The number of ministers increased, and societies were formed. These in due time became the constituents of larger organizations, till a "New England convention" saw occasion, in 1803, to adopt a "profession of faith," which in three short articles avowed belief in the Bible as making known in a Divine revelation the nature of God, the mission of Christ, the final holiness of all souls, and the necessity of good works. In 1866 a general convention, composed of delegates from the State conventions, was incorporated. It has jurisdiction throughout the United States and Canada. It has a "Murray fund" of about $135,000. Under the auspices of the Universalist Church are the "woman's centenary association," the "Universalist historical society," several organized charities, four colleges, three theological schools, and five academies.—the total value of the schools, including endowments, being hardly less than 3 million dollars. It publishes eight periodicals. The *Year Book* for 1887 gives the following summary: 1 general convention; 22 State conventions; 945 parishes, 38,429 families; 696 churches, 35,550 members; 634 Sunday schools, 51,871 members; 789 church edifices; value above indebtedness, $7,493,927; 673 clergymen in fellowship and 120 licensed lay preachers.

1 [Vol. XXIX. contains under the title UNIVERSALISTS fuller particulars of this religious society.—AM. ED.]

UNIVERSITIES.[1]

THE mediæval Latin term *universitas* (from which the English word "university" is derived) was originally employed to denote any community or corporation regarded under its collective aspect. When used in its modern sense, as denoting a body devoted to learning and education, it required the addition of other words in order to complete the definition,—the most frequent form of expression being "universitas magistrorum et scholarium" (or "discipulorum"). In the course of time, probably towards the latter part of the 14th century, the term began to be used by itself, with the exclusive meaning of a community of teachers and scholars whose corporate existence had been recognized and sanctioned by civil or ecclesiastical authority or by both. But the more ancient and customary designation of the university in mediæval times (regarded as a place of instruction) was "studium generale" (or sometimes "studium" alone), a term implying a centre of instruction for all.[2] The expressions "universitas studii" and "universitatis collegium" are also occasionally to be met with in official documents.

Original meaning of the term "university."

Its limitation in mediæval times.

It is necessary, however, to bear in mind, on the one hand, that a university often had a vigorous virtual existence long before it obtained that legal recognition which entitled it, technically, to take rank as a "studium generale," and, on the other hand, that hostels, halls, and colleges, together with complete courses in all the recognized branches of learning, were by no means necessarily involved in the earliest conception of a university. The university, in its earliest stage of development, appears to have been simply a scholastic guild,—a spontaneous combination, that is to say, of teachers or scholars, or of both combined, and formed probably on the analogy of the trades guilds, and the guilds of aliens in foreign cities, which, in the course of the 13th and 14th centuries, are to be found springing up in most of the great European centres. The design of these organizations, in the first instance, was little more than that of securing mutual protection,—for the craftsman, in the pursuit of his special calling,—for the alien, as lacking the rights and privileges inherited by the citizen. And so the university, composed as it was to a great extent of students from foreign countries, was a combination formed for the protection of its members from the extortion of the townsmen and the other annoyances incident in mediæval times to residence in a foreign state. It was a first stage of development in connection with these primary organizations, when the chancellor of the cathedral, or some other authority, began, as we shall shortly see, to confer on their masters the right of teaching at any similar centre that either already existed or might afterwards be formed throughout Europe,—"facultas ubique docendi." It was a still further development when it began to be recognized that, without a license from either pope, emperor, or king, no "studium generale" could be formed possessing this right of conferring degrees, which originally meant nothing more than licenses to teach.

In order, however, clearly to understand the conditions under which the earliest universities came into existence, it is necessary to take account, not only of their organization, but also of their studies, and to recognize the main influences which, from the 6th to the 12th century, served to modify both the theory and the practice of education. In the former century, the schools of the Roman empire, which had down to that time kept alive the traditions of pagan education, had been almost entirely swept away by the barbaric invasions. The latter century marks the period when the institutions which supplied their place—the episcopal schools attached to the cathedrals and the monastic schools—attained to their highest degree of influence and reputation. Between these and the schools of the empire there existed an essential difference, in that the theory of education by which they were pervaded was in complete contrast to the simply secular theory of the schools of paganism. The cathedral school taught only what was supposed to be necessary for the education of the priest; the monastic school taught only what was supposed to be in harmony with the aims of the monk. But between the pagan system and the Christian system by which it had been superseded there yet existed something that was common to both: the latter, even in the narrow and meagre instruction which it imparted, could not altogether dispense with the ancient text-books, simply because there were no others in existence. Certain treatises of Aristotle, of Porphyry, of Martianus Capella, and of Boetius continued consequently to be used and studied; and in the slender outlines of pagan learning thus still kept in view, and in the exposition which they necessitated, we recognize the main cause which prevented the thought and literature of classic antiquity from falling altogether into oblivion.

Chief facts in the history of learning before the university era.

Under the rule of the Merovingian dynasty even these scanty traditions of learning declined throughout the Frankish dominions; but in England the designs of Gregory the Great, as carried out by Theodorus, Bede, and Alcuin, resulted in a great revival of education and letters. The influence of this revival extended in the 8th and 9th centuries to Frankland, where Charles the Great, advised and aided by Alcuin, effected a memorable reformation, which included both the monastic and cathedral schools; while the school attached to the imperial court, known as the Palace School, also became a famous centre of learned intercourse and instruction.

Revival in time of Charles the Great.

But the activity thus generated, and the interest in learning which it served for a time to diffuse, well-nigh died out amid the anarchy which characterizes the 10th century in Latin Christendom, and it is at least questionable whether any real connection can be shown to have existed between this earlier revival and that remarkable movement in which the university of Paris had its origin. On the whole, however, a clearly traced, although imperfectly continuous, succession of distinguished teachers has inclined the majority of those who have studied this obscure period to conclude that a certain tradition of learning, handed down from the famous school over which Alcuin presided at the great abbey of St. Martin at Tours, continued to survive, and became the nucleus of the teaching in which the university took its rise. But, in order adequately to explain the remarkable development and novel character which that teaching assumed in the course of the 12th and 13th centuries, it is necessary to take account of the operation of certain more general causes to which the origin of the great majority of the earlier universities may in common unhesitatingly be referred. These causes are—(1) the introduction of new subjects of study, as embodied in a new or revived literature; (2) the adoption of new methods of teaching which were rendered necessary by the new studies; (3) the growing tendency to organization which accompanied the development and consolidation of the European nationalities.

Its connection with university of Paris doubtful.

General causes of formation of first universities.

[1] It is the design of the present article to exhibit the universities in their historical development, each being brought under notice, as far as practicable, in the order of its original foundation. In the alphabetical enumeration in the table at the end, the date of foundation thus serves to indicate approximately the place where any university is first referred to.

[2] Denifle. *Die Universitäten des Mittelalters*, i. 39.

That the earlier universities took their rise to a great extent in endeavors to obtain and provide instruction of a kind beyond the range of the monastic and cathedral schools appears to be very generally admitted, and this general fact has its value in assisting us to arrive at a conclusion with respect to the origin of the first European university,—that of Salerno in Italy, which became known as a school of medicine as early as the 9th century. The circumstances of its rise are extremely obscure, and whether it was monastic or secular in its origin has been much disputed. One writer[1] derives its origin from an independent tradition of classical learning which continued to exist in Italy down to the 10th century. Another writer[2] maintains that it had its commencement in the teaching at the famous Benedictine monastery of Monte Cassino, where the study of medicine was undoubtedly pursued. But various facts may be urged in contravention of such a theory. The school at Salerno, so far as its history can be traced, appears to have been entirely a secular community; it was distinguished also by its catholic spirit, and, at a time when Jews were the object of religious persecution throughout Europe, members of this nationality were to be found both as teachers and learners at Salerno. Situated, moreover, as it was on the seacoast, its communication with the neighboring island of Sicily was easy and frequent; and it would accordingly seem far more probable that it was owing to the new knowledge gained from the Saracens, after their occupation of that island, that Salerno acquired its reputation. It was by a band of these invaders that Bertharius, abbot of Monte Cassino, and the author of certain medical treatises, was massacred along with his monks in the year 883. The Saracens were famed for their medical skill, and by their translations of Galen and Hippocrates, did much to advance the study; and, according to Jourdain,[3] there were translations from the Arabic into Latin long before the time of Constantine the African, but these versions have perished. In the course of the 11th century, under the teaching of Constantine the African (d. 1087), the celebrity of Salerno became diffused all over Europe. Ordericus Vitalis, who wrote in the first half of the 12th century, speaks of it as then long famous. In 1231 it was constituted by the emperor Frederick II. the only school of medicine in the kingdom of Naples.

Rise of university of Salerno.

It was at a considerable interval after the rise of the school at Salerno, about the year 1113, that Irnerius commenced at Bologna his lectures on the civil law. This instruction, again, was of a kind which the monastic and cathedral schools could not supply, and it also met a new and pressing want. The states of Lombardy were at this time rising rapidly in population and in wealth; and the greater complexity of their political relations, their increasing manufactures and commerce, called for a more definite application of the principles embodied in the codes that had been handed down by Theodosius and Justinian. But the distinctly secular character of this new study, and its intimate connection with the claims and prerogatives of the Western emperor, aroused at first the susceptibilities of the Roman see, and for a time Bologna and her civilians were regarded by the church with distrust and even with alarm. These sentiments were not, however, of long duration. In the year 1151 the appearance of the *Decretum* of Gratian, largely compiled from spurious documents, invested the studies of the canonist with fresh importance; and numerous decrees of past and almost forgotten pontiffs now claimed to take their stand side by side with the enactments contained in the *Corpus Juris Civilis*. They constituted, in fact, the main basis of those new pretensions asserted with so much success by the popedom in the course of the 12th and 13th centuries. It was necessary, accordingly, that the *Decretum* should be known and studied beyond the walls of the monastery or the episcopal palace, and that its pages should receive authoritative exposition at some common centre of instruction. Such a centre was to be found in Bologna. The needs of the secular student and of the ecclesiastical student were thus brought for a time into accord, and from the days of Irnerius down to the close of the 13th century we have satisfactory evidence that Bologna was generally recognized as the chief school both of the civil and the canon law.[4] It has indeed been asserted that university degrees were instituted there as early as the pontificate of Eugenius III. (1145–53), but the statement rests on no good authority, and is in every way improbable. There is, however, another tradition which is in better harmony with the known facts. When Barbarossa marched his forces into Italy on his memorable expedition of 1155, and reasserted those imperial claims which had so long lain dormant, the professors of the civil law and their scholars, but more especially the foreign students, gathered round the western representative of the Roman Cæsars, and besought his intervention in their favor in their relations with the citizens of Bologna. A large proportion of the students were probably from Germany; and it did not escape Frederick's penetration that the civilian might prove an invaluable ally in the assertion of his imperial pretensions. He received the suppliants graciously, and, finding that their grievances were real, especially against the landlords in whose houses they were domiciled, he granted the foreign students substantial protection, by conferring on them certain special immunities and privileges (November 1158).[5] These privileges were embodied in the celebrated *Authentica*, *Habita*, in the *Corpus Juris Civilis* of the empire (bk. iv. tit. 13), and were eventually extended so as to include all the other universities of Italy. In them we may discern the precedent for that state protection of the university which, however essential at one time for the security and freedom of the teacher and the taught, has been far from proving an unmixed benefit,—the influence which the civil power has thus been able to exert being too often wielded for the suppression of that very liberty of thought and inquiry from which the earlier universities derived in no small measure their importance and their fame.

Teaching of Irnerius at Bologna.

Decretum of Gratian and the canon law.

Barbarossa grants privileges to foreign students at Bologna.

But, though there was a flourishing school of study, it is to be observed that Bologna did not possess a university so early as 1158. Its first university was not constituted until the close of the 12th century. The "universities" at Bologna were, as Denifle has shown, really student guilds, formed under influences quite distinct from the protecting clauses of the *Authentica*, and suggested, as already noted, by the precedent of those foreign guilds which, in the course of the 12th century, began to rise throughout western Europe. They had their origin in the absolute necessity, under which residents in a foreign city found themselves, of obtaining by combination that protection and those rights which they could not claim as citizens. These societies were modelled, Denifle considers, not on the trade guilds which rose in Bologna in the 13th century, but on the Teutonic guilds which arose nearly a century earlier in northwestern Europe, being essentially

The "universities" at Bologna.

The story is preserved in a recently discovered metrical composition descriptive of the history of Frederick I.; see *Sitzungsberichte d. Bairisch. Akad. d. Wissenschaft Phil.-Hist. Klasse*, 1879, ii. 285. Its authenticity is called in question by Denifle, but it would seem to be quite in harmony with the known facts.

"spontaneous confederations of aliens on a foreign soil." Originally, they did not include the native student element.

Democratic character of these communities.

The power resulting from this principle of combination, when superadded to the privileges conferred by Barbarossa, gave to the students of Bologna a superiority of which they were not slow to avail themselves. Under the leadership of their rector, they extorted from the citizens concessions which raised them from the condition of an oppressed to that of a specially privileged class. The same principle, when put in force against the professors, reduced the latter to a position of humble deference to the very body whom they were called upon to instruct, and imparted to the entire university that essentially democratic character by which it was afterwards distinguished. It is not surprising that such advantages should have led to an imitation and extension of the principle by which they were obtained. Denifle considers that the "universities" at Bologna were at one time certainly more than four in number, and we know that the Italian students alone were subdivided into two,—the Tuscans and the Lombards. In the centres formed by secession from the parent body a like subdivision took place. At Vercelli there were four "universitates," composed respectively of Italians, English, Provençals, and Germans; at Padua there were similar divisions into Italians, French (*i.e.*, *Francigenæ*, comprising both English and Normans), Provençals (including Spaniards and Catalans). When accordingly we learn from Odofred that in the time of the eminent jurist Azo, who lectured at Bologna about 1200, the number of students there amounted to some ten thousand, of whom the majority were foreigners, it seems reasonable to conclude that the number of these confederations of students ("societates scholarium") at Bologna was yet greater. It is certain that they were not formed simultaneously, but, similarly to the free guilds, one after the other,—the last in order being that of the Tuscans, which was composed of students from Tuscany, the Campagna, and Rome. Nor are we, again, to look upon them as in any way the outcome of those democratic principles which found favor in Bologna, but rather as originating in the traditional home associations of the foreign students, fostered, however, by the peculiar conditions of their university life. As the Tuscan division (the one least in sympathy, in most respects, with Teutonic institutions) was the last formed, so, Denifle conjectures, the German "university" may have introduced the conception which was successively adopted by the other nationalities.

Other similar communities in Italy.

In marked resemblance to the guilds, these confederations were presided over by a common head,—the "rector scholarium," an obvious imitation of the "rector societatum" or "artium" of the guild, but to be carefully distinguished from the "rector scholarum," or director of the studies, with whose function the former officer had, at this time, nothing in common. Like the guilds, again, the different nations were represented by their "consiliarii," a deliberative assembly with whom the rector habitually took counsel.

The rector.

While recognizing the essentially democratic character of the constitution of these communities, it is to be remembered that the students, unlike the majority at Paris and later universities, were mostly at this time of mature years. As the civil law and the canon law were at first the only branches of study, the class whom they attracted were often men already filling office in some department of the church or state,—archdeacons, the heads of schools, canons of cathedrals, and like functionaries forming a considerable element in the aggregate. It has been observed, indeed, that the permission accorded them by Frederick I. of choosing, in all cases of dispute, their own tribunal, thus constituting them, to a great extent, *sui juris*, seems to presuppose a certain maturity of judgment among those on whom this discretionary power was bestowed.

Mature age of the students.

With the middle of the 13th century, these various confederations became blended, for the first time, into one or other of the two great divisions already referred to,—those of the Ultramontani and the Citramontani, Johannes de Varanis being rector of the former and Pantaleon de Venetiis of the latter. Innocent IV., in according his sanction to the new statutes of the university in 1253, refers to them as drawn up by the "rectores et universitas scholarium Bononiensium." With the commencement of the 16th century, the two corporations were combined under one rector.

Amalgamation of the "universitates" into two divisions.

About the year 1200 were formed the two faculties of medicine and philosophy (or the arts[1]), the former being somewhat the earlier. It was developed, as that of the civil law had been developed, by a succession of able teachers, among whom Thaddens Alderottus was especially eminent. The faculty of arts, down to the 14th century, scarcely attained to equal eminence. The teaching of theology remained for a long time exclusively in the hands of the Dominicans; and it was not until the year 1360 that Innocent VI. recognized the university as a "studium generale" in this branch,—in other words, as a place of theological education for all students, with the power of conferring degrees of universal validity.

Faculties instituted.

In the year 1371 the cardinal legate, Anglicus, compiled, as chief director of ecclesiastical affairs in the city, an account of the university, which he presented to Urban V.[2] The information it supplies is, however, defective, owing to the fact that only the professors who were in receipt of salaries from the municipality are mentioned. Of these there were twelve of civil law and six of canon law; three of medicine, three of practical medicine, and one of surgery; two of logic, and one each of astrology, rhetoric, and notarial practice. The professors of theology, who, as members of the religious orders, received no state remuneration, are unmentioned.

Account of the university by Anglicus.

Colleges existed at Bologna at a very early date, but it is not until the 14th century that we find them possessing any organization. They were designed solely for necessitous students, not being natives of Bologna. A separate house, with a certain fund for the maintenance of a specified number of scholars, was all that was originally contemplated. Such was the character of that founded by Zoen, bishop of Avignon, in February, 1256 (O.S.), the same month and year, it is to be noted, in which the Sorbonne was founded in Paris. It was designed for the maintenance of eight scholars from the province of Avignon, under the supervision of three canons of the church, maintaining themselves in the university. Each scholar was to receive 24 Bolognese lire annually for five years. The college of Brescia was founded in 1326 by William of Brescia, archdeacon of Bologna, for poor foreign students without distinction as to nationality. The Spanish college, founded in 1364, for twenty-four Spanish scholars and two chaplains, is noted by Denifle as the one college founded in mediæval times which still exists on the Continent.

The earliest colleges.

Of the general fact that the early universities rose in response to new wants the commencement of the university of Paris supplies us with a further illustra-

[1] The arts course of study was that represented by the ancient *trivium* (*i.e.*, grammar, logic, and rhetoric) and the *quadrivium* (*i.e.*, arithmetic, geometry, music, and astronomy), as handed down from the schools of the Roman empire. See J. B. Mullinger, *History of the University of Cambridge*, i. 24-27.

[2] [Urban V. died in 1370 and was succeeded in the same year by Gregory XI. See vol. xix. p. 524.—Am. Ed.]

tion. The study of logic, which, prior to the 12th century, was founded exclusively on one or two meagre compends, received about the year 1100, on two occasions, a powerful stimulus,—in the first instance, from the memorable controversy between Lanfranc and Berengar; in the second, from the no less famous controversy between Anselm and Roscellinus. A belief sprang up that an intelligent apprehension of spiritual truth depended on a correct use of prescribed methods of argumentation. Dialectic was looked upon as "the science of sciences;" and, when, somewhere in the first decade of the 12th century, William of Champeaux opened in Paris a school for the more advanced study of dialectic as an art, his teaching was attended with marked success. Among his pupils was Abelard, in whose hands the study made a yet more notable advance; so that, by the middle of the century, we find John of Salisbury, on returning from the French capital to England, relating with astonishment, not unmingled with contempt, how all learned Paris had gone well nigh mad in its pursuit and practice of the new dialectic.

Origin of university of Paris.

Study of logic.

Abelard taught in the first instance at the cathedral school at Notre Dame, and subsequently at the schools on the Montagne Sainte-Geneviève, of which he was the founder, and where he imparted to logic its new development. But in 1147 the secular canons of Ste. Geneviève gave place to canons regular from St. Victor; and henceforth the school on the former foundation was merely a school for the teaching of theology, and was attended only by the members of the house.[1] The schools out of which the university arose were those attached to the cathedral on the Île de la Cité, and presided over by the chancellor,—a dignitary who must be carefully distinguished from the later chancellor of the university. For a long time the teachers lived in separate houses on the island, and it was only by degrees that they combined themselves into a society, and that special buildings were constructed for their class-work. But the flame which Abelard's teaching had kindled was not destined to expire. Among his pupils was Peter Lombard, who was bishop of Paris in 1159, and widely known to posterity as the compiler of the famous volume of the *Sentences*. The design of this work was to place before the student, in as strictly logical a form as practicable, the views (*sententiæ*) of the fathers and all the great doctors of the church upon the chief and most difficult points in the Christian belief. Conceived with the purpose of allaying and preventing, it really stimulated, controversy. The logicians seized upon it as a great storehouse of indisputable major premises, on which they argued with renewed energy and with endless ingenuity of dialectical refinement; and upon this new compendium of theological doctrine, which became the text-book of the Middle Ages, the schoolmen, in their successive treatises *super Sententias*, expended a considerable share of that subtlety and labor which still excite the astonishment of the student of metaphysical literature.

Teaching of Abelard.

Study of theology.

Lombard's *Sentences*.

It is in these prominent features in the history of these early universities—the development of new methods of instruction concurrently with the appearance of new material for their application—that we find the most probable solution of the question as to how the university, as distinguished from the older cathedral or monastic schools, was first formed. In a similar manner, it seems probable, the majority of the earlier universities of Italy—Reggio, Modena, Vicenza, Padua, and Vercelli—arose, for they had their origin independently alike of the civil and the papal authority.

Rise of other early universities.

Instances, it is true, occur, which cannot be referred to this spontaneous mode of growth. The university of Naples, for example, was founded solely by the fiat of the emperor Frederick II. in the year 1224: and, if we may rely upon the documents cited by Denifle, Innocent IV. about the year 1245 founded in connection with the curia a "studium generale,"[2] which was attached to the papal court, and followed it when removed from Rome, very much as the Palace School of Charles the Great accompanied that monarch on his progresses.

As the university of Paris became the model, not only for the universities of France north of the Loire, but also for the great majority of those of central Europe as well as for Oxford and Cambridge, some account of its early organization will here be indispensable. Such an account is rendered still further necessary by the fact that the recent and almost exhaustive researches of Denifle, the Dominican father, have led him to conclusions which on some important points run altogether counter to those sanctioned by the high authority of Savigny.

Early organization of university of Paris.

The original university, as already stated, took its rise entirely out of the movement carried on by teachers on the island, who taught by virtue of the license conferred by the chancellor of the cathedral. In the second decade of the 13th century, it is true, we find masters withdrawing themselves from his authority by repairing to the left bank of the Seine and placing themselves under the jurisdiction of the abbot of the monastery of Ste. Geneviève; and in 1255 this dignitary is to be found appointing a chancellor whose duty it should be to confer "licentia docendi" on those candidates who were desirous of opening schools in that district. But it was around the bestowal of this license by the chancellor of Notre Dame, on the Île de la Cité, that the university of Paris grew up. It is in this license that the whole significance of the master of arts degree is contained; for what is technically known as admission to that degree was really nothing more nor less than receiving the chancellor's permission to "incept," and by "inception" was implied the master's formal entrance upon, and commencement of, the functions of a duly licensed teacher, and his recognition as such by his brothers in the profession. The previous stage of his academic career, that of bachelordom, had been one of apprenticeship for the mastership; and his emancipation from this state was symbolized by placing the magisterial cap (*biretta*) upon his head, a ceremony which, in imitation of the old Roman ceremony of manumission, was performed by his former instructor, "under whom" he was said to incept. He then gave a formal inaugural lecture, and, after this proof of magisterial capacity, was welcomed into the society of his professional brethren with set speeches, and took his seat in his master's chair.

The teaching that formed its nucleus.

Inception.

Bachelor of arts.

This community of teachers of recognized fitness did not in itself suffice to constitute a university, but some time between the years 1150 and 1170, the period when the *Sentences* of Peter Lombard was given to the world, the university of Paris came formally into being. Its first written statutes were not, however, compiled until about the year 1208, and it was not until long after that date that it possessed a "rector." Its earliest recognition as a legal corporation belongs to about the year 1211, when a brief of Innocent III. empowered it to elect a proctor to be its representative at the papal court. By this permission it obtained the right to sue or to be sued in a court of justice as a corporate body.

The university formed.

[1] The view of Thurot (*De l'Organisation de l'Enseignement dans l'Université de Paris*, pp. 4–7) that the university arose out of a combination of these several schools is rejected by Denifle (see *Die Universitäten*, etc., i. 653–694).

[2] Where the words *studium generale* are placed within marks of quotation they occur in the original charter of foundation of the university referred to.

This papal recognition was, however, very far from implying the episcopal recognition, and the earlier history of the new community exhibits it as in continual conflict alike with the chancellor, the bishop, and the cathedral chapter of Paris, by all of whom it was regarded as a centre of insubordination and doctrinal license. Had it not been, indeed, for the papal aid, the university would probably not have survived the contest; but with that powerful assistance it came to be regarded as the great Transalpine centre of orthodox theological teaching. Successive pontiffs, down to the great schism of 1378, made it one of the foremost points of their policy to cultivate friendly and confidential relations with the authorities of the university of Paris, and systematically to discourage the formation of theological faculties at other centres. In 1231 Gregory IX., in the bull *Parens Scientiarum*, gave full recognition to the right of the several faculties to regulate and modify the constitution of the entire university—a formal sanction which, in Denifle's opinion, rendered the bull in question the Magna Charta of the university.

Difficulties attending its first development.

In comparing the relative antiquity of the universities of Paris and Bologna, it is difficult to give an unqualified decision. The university of masters at the former was probably slightly anterior to the university of students at the latter; but there is good reason for believing that Paris, in reducing its traditional customs to statutory form, largely availed itself of the precedents afforded by the already existing code of the Transalpine centre, while its rectorship, proctorships, and four "nations" are all clearly distinct adaptations of the corresponding divisions at Bologna. These nations, which included both professors and scholars, were—(1) the French nation, composed, in addition to the native element, of Spaniards, Italians, and Greeks; (2) the Picard nation, representing the students from the northeast and from the Netherlands; (3) the Norman nation; (4) the English nation, comprising, besides students from the provinces under English rule, those from England, Ireland, Scotland, and Germany. These several nations first came into existence some time before the year 1219, and all belonged to the faculty of arts; but the fully developed university was divided into four faculties,—three "superior," viz., those of theology, canon law, and medicine, and one "inferior," that of arts. The head of each faculty was the dean; the head of each nation was the proctor. The rector, who in the first instance was head of the faculty of arts, by whom he was elected, was eventually head of the whole university. Each of the nations and each of the superior faculties, while subject to the general authority which he represented, was, like a royal colony, in a great measure self-governed, and made statutes which were binding simply on its own members. Congregations of the faculty of arts were presided over by the rector, who discharged the same function when general congregations of the whole academic community were convened. In the former the votes on any question were taken by nations, in the latter by faculties and nations. Only "regents," that is, masters actually engaged in teaching, had any right to be present or to vote in congregations. Neither the entire university nor the separate faculties had thus, it will be seen, originally a common head, and it was not until the middle of the 14th century that the rector became the head of the collective university, by the incorporation under him, first, of the students of the canon law and of medicine (which took place about the end of the 13th century), and, secondly, of the theologians, which took place about half a century later.

The "nations."

Apart from the broad differences in their organization, the very conception of learning, it will be observed, was different at Bologna from what it was at Paris. In the former it was entirely professional,—designed, that is to say, to prepare the student for a definite and practical career in after life; in the latter it was sought to provide a general mental training, and to attract the learner to studies which were speculative rather than practical. In the sequel, the less mercenary spirit in which Paris cultivated knowledge added immensely to her influence and reputation. The university became known as the great school where theology was studied in its most scientific spirit; and the decisions of its great doctors upon those abstruse questions which absorbed so much of the highest intellectual activity of the Middle Ages were regarded as almost final. The popes themselves, although averse from theological controversies, deemed it expedient to cultivate friendly relations with a centre of such importance for the purpose of securing their influence in a yet wider field. Down therefore to the time of the great schism (1378), they at once conciliated the university of Paris and consulted what they deemed to be the interests of the Roman see, by discouraging the creation of faculties of theology elsewhere. The apparent exceptions to this policy are easily explained: the four faculties of theology which they sanctioned in Italy—Pisa (1343), Florence (1349), Bologna (1362), and Padua (1363)—were designed to benefit the Italian monasteries, by saving the monks the expense and dangers of a long journey beyond the Alps; while that at Toulouse (1229) took its rise under circumstances entirely exceptional, being designed as a bulwark against the heresy of the Albigenses. The popes, on the other hand, favored the creation of new faculties of law, and especially of the canon law, as the latter represented the source from which Rome derived her most warmly contested powers and prerogatives. The effects of this twofold policy were sufficiently intelligible: the witholding of each charter which it was sought to obtain for a new school of theology only served to augment the numbers that flocked to Paris; the bestowal of each new charter for a faculty of law served in like manner to divert a certain proportionate number from Bologna. These facts enable us to understand how it is that, in the 13th and 14th centuries, we find, even in France, a larger number of universities created after the model of Bologna than after that of Paris.

Paris and Bologna contrasted.

Papal policy in relation to the universities.

In their earliest stage, however, the importance of these new institutions was but imperfectly discerned alike by the civil and the ecclesiastical power, and the first four universities of Italy, after Bologna, rose into existence, like Bologna itself, without a charter from either pope or emperor. Of these the first were those of Reggio and Modena, both of which are to be found mentioned as schools of civil law before the close of the 12th century. The latter, throughout the 13th century, appears to have been resorted to by teachers of sufficient eminence to form a flourishing school, composed of students not only from the city itself, but also from a considerable distance. Both of them would seem to have been formed independently of Bologna, but the University of Vicenza was probably the outcome of a migration of the students from the former city, which took place in the year 1204. In the course of the century Vicenza attained to considerable prosperity; its students were divided into four nations, each with its own rector; and in 1264 it included in its professoriate teachers, not only of the civil law, but also of medicine, grammar, and dialectic. The university of Padua was founded in 1222 as the direct result of the migration of a considerable number of students from Bologna. Some writers, indeed, have inferred that the "studium" in the latter city was transferred in its entirety, but the continued residence of a certain proportion in Bologna is proved by the fact that two years later we find them appealing to Honorius III. in a dispute with the civic authorities. In the year 1228 the students of Padua

Foundation of universities of Reggio and Modena,

Vicenza,

Padua,

were compelled by circumstances to transfer their residence to Vercelli, and the latter city guaranteed them, besides other privileges, the right to rent no less than five hundred lodging-houses at a fixed rental for a period of eight years. At first Padua was a school only of the civil and canon law; and during the oppressive tyranny of Ezzelin (1237–1260) the university maintained its existence with some difficulty. But in the latter part of the century it incorporated the faculties of grammar, rhetoric, and medicine, and became known as one of the most flourishing schools of Italy, and a great centre of the Dominicans, at that time among the most active promoters of learning.

Naples, The university of Naples was founded by the emperor Frederick II. in the year 1225, as a school of theology, jurisprudence, the arts, and medicine,—his design being that his subjects in the kingdom of Naples should find in the capital adequate instruction in every branch of learning, and "not be compelled in the pursuit of knowledge to have recourse to foreign nations or to beg in other lands." In the year 1231, however, he decreed that the faculty of medicine should cease to exist, and that the study should be pursued nowhere in the kingdom but at Salerno. The university never attained to much eminence, and after the death of Frederick came for a time altogether to an end, but was restored in 1258 by King Manfred. In 1266 its faculty of medicine was reconstituted, and from 1272–74 Thomas Aquinas was one of its teachers of theology.

Vercelli, The commencement of the university of Vercelli belongs to about the year 1228; it probably included, like Naples, all the faculties, but would seem to have been regarded with little favor by the Roman see, and by the year 1372 had ceased to exist, although mention of colleges of law and medicine is to be found after that date. The two universi-

Piacenza, ties of Piacenza and Pavia stand in close connection with each other. The former is noted by Denifle as the earliest in Italy which was founded by virtue of a papal charter (6th February, 1248), although the scheme remained for a long time inoperative. At length, in the year 1398, the university was reconstituted by Giovanni Galeazzo Visconti, duke of Milan, who in the same year caused the university of Pavia to be transferred thither. Piacenza now became the scene of a sudden but short-lived academic prosperity. We are told of no less than twenty-seven professors of the civil law,—among them the celebrated Baldus; of twenty-two professors of medicine; of professors of philosophy, astrology, grammar, and rhetoric; and of lecturers on Seneca and Dante. The faculty of theology would appear, however, never to have been duly constituted, and but one lecturer in this faculty is mentioned. With the death of Galeazzo in 1402, this precarious activity came suddenly to an end; and in 1404 the university had ceased to exist. Its history is, indeed, unintelli-

Pavia, gible, unless taken in conjunction with that of Pavia. Even before Irnerius taught at Bologna, Pavia had been widely known as a seat of legal studies, and more especially of the Lombard law, although the evidence is wanting which would serve to establish a direct connection between this early school and the university which was founded there in 1361, by virtue of the charter granted by the emperor Charles IV. The new "studium" included faculties of jurisprudence, philosophy, medicine, and the arts, and its students were formally taken under the imperial protection, and endowed with privileges identical with those which had been granted to Paris, Bologna, Oxford, Orleans, and Montpellier; but its existence in Pavia was suddenly suspended by the removal, above noted, of its students to Piacenza. It shared again in the decline which overtook the university of Piacenza after the death of Giovanni Galeazzo, and during the period from 1404 to 1412 it altogether ceased to exist. But in October, 1412, the lectures were recommenced, and the university entered upon the most brilliant period of its existence. Its professors throughout the 15th century were men of distinguished ability, attracted by munificent salaries such as but few other universities could offer, while in the number of students who resorted thither from other countries, and more especially for the study of the civil law, Pavia had no rival in Italy but Padua. Arezzo appears to have been

Arezzo, known as a centre of the same study so early as 1215, and its earliest statutes are assigned to the year 1255. By that time it had become a school of arts and medicine also; but for a considerable period after it was almost entirely deserted, and is almost unmentioned until the year 1338, when it acquired new importance by the accession of several eminent jurists from Bologna. In May, 1355, it received its charter as a studium generale from Charles IV. After the year 1373 the school gradually dwindled, although it did not become altogether extinct until about the year 1470. The university of

Rome, Rome (which is to be carefully distinguished from the school attached to the curia) owed its foundation (1303) to Boniface VIII., and was especially designed by that pontiff for the benefit of the poor foreign students sojourning in the capital. It originally included all the faculties; but in 1318 John XXII. decreed that it should possess the power of conferring degrees only in the canon and civil law. The university maintained its existence throughout the period of the residence of the popes at Avignon (see POPEDOM), and under the patronage of Leo X. could boast in 1514 of no less than eighty professors. This imposing array would seem, however, to be but a fallacious test of the prosperity of the academic community, for it is stated that many of the professors, owing to the imperfect manner in which they were protected in their privileges, were in the receipt of such insufficient fees that they were compelled to combine other employments with that of lecturing in order to support themselves. An appeal addressed to Leo X. in the year 1513 represents the number of students as so small as to be sometimes exceeded by that of the lecturers ("ut quandoque plures sint qui legant quam qui audiant"). Scarcely any of the universities in Italy in the 14th century attracted a larger concourse than that of Perugia, where the

Perugia, study chiefly cultivated was that of the civil law. The university received its charter as a studium generale from Clement V. in the year 1308, but had already in 1306 been formally recognized by the civic authorities, by whom it was commended to the special care and protection of the "podestà." In common with the rest of the Italian universities, it suffered severely from the great plague of 1348–49; but in 1355 it received new privileges from the emperor, and in 1362 its first college, dedicated to Gregory the Great, was founded by the bishop of Perugia.

Treviso, The university of Treviso, which received its charter from Frederick the Fair in 1318, was of little celebrity and but short duration. It is doubtful, indeed, whether it continued to exist after the city became subject to the republic of Venice in the year 1339; but in 1409 the Venetian senate issued a decree that no subjects of the republic should resort for study to any city in its dominions save that of Padua, and from this date the studium at Treviso must be held to have been no longer in existence. The circumstances of the rise of the university of

Florence, Florence are unknown, but the earliest evidence of academic instruction belongs to the year 1320. The dispersion of the university of Bologna, in the March and April of the following year, afforded a favorable opportunity for the creation of a studium generale, but the necessary measures were taken somewhat tardily, and in the meantime the greater number of the Bolognese students had be-

taken themselves to Siena. The charter of foundation for Florence was accordingly not granted until 31st May, 1349, when Clement VI. decreed that there should be instituted a studium generale in theology, jurisprudence, medicine, and every other recognized faculty of learning, the teachers to be professors who had obtained the degree of doctor or master either at Bologna or Paris, or "some other studium generale of celebrity." On 2d January, 1364, the university also obtained the grant of imperial privileges from Charles IV. On 14th February, 1388, it adopted a body of statutes which are still extant, and afford an interesting study in connection with the university history of the period. The university now entered upon that brilliant period in its history which was destined to so summary an extinction. "It is almost touching," says Denifle, "to note how untiringly Florence exerted herself at this period to attract as teachers to her schools the great masters of the sciences and learning." In the year 1472, however, under the influence of Lorenzo de' Medici, it was decided that Florence was not a convenient seat for a university, and its students were removed to Pisa. The

Siena, commencement of the university of Siena belongs to about the year 1241, but its charter was first granted by the emperor Charles IV., at the petition of the citizens, in the year 1357. It was founded as a studium generale in jurisprudence, the arts, and medicine. The imperial charter was confirmed by Gregory XII. in 1408, and the various bulls relating to the university which he subsequently issued afford a good illustration of the conditions of academic life in these times. Residence on the part of the students appears to have been sometimes dispensed with. The bishop of Siena was nominated chancellor of the university, just as, says the bull, he had been appointed to that office by the imperial authority. The graduates were to be admitted to the same privileges as those of Bologna or Paris; and a faculty of theology was added to the curriculum of

Ferrara, studies. The university of Ferrara owes its foundation to the house of Este,—Alberto, marquis of Este, having obtained from Boniface IX. in 1391 a charter couched in terms precisely similar to those of the charter for Pisa. In the first half of the 15th century the university was adorned by the presence of several distinguished humanists, but its fortunes were singularly checkered, and it would appear for a certain period to have been altogether extinct. It was, however, restored, and became in the latter part of the century one of the most celebrated of the universities of Italy. In the year 1474 its circle of studies comprised all the existing faculties, and it numbered no less than fifty-one professors or lecturers. In later times Ferrara has been noted chiefly as a school of medicine.

Of the universities modelled on that of Paris, Oxford would appear to have been the

Oxford, earliest, and the manner of its development was probably similar. Certain schools, opened within the precincts of the dissolved nunnery of St. Frideswyde and of Osney abbey, are supposed to have been the nucleus round which the university grew up. In the year 1133 one Robert Pullen, a theologian of considerable eminence (but whether an Englishman or a Breton is uncertain), arrived from Paris, and delivered lectures on the Bible. He was followed a few years later by Vacarius, a native of Lombardy, who as a student at Bologna had inherited the tradition of the teaching of Irnerius. Although both the pope and King Stephen regarded the civil law at this time with considerable distrust, Vacarius maintained his ground, and the study became one of the recognized faculties at Oxford. Towards the close of the 12th century Giraldus Cambrensis describes the town as a place "where the clergy in England chiefly flourished and excelled in clerkly lore." In one respect, indeed, Oxford was more favored than even Paris, for the town authorities could not pretend to assert any right of interference with the university such as that to which the French monarch and the court frequently laid claim. In the 13th century mention first occurs of university "chests," especially the Frideswyde chest, which were benefactions designed as funds for the assistance of poor students. Halls, or places of licensed residence for students, also began to be established. In the year 1257, when the bishop of Lincoln, as diocesan, had trenched too closely on the liberties of the community, the deputies from Oxford, when preferring their appeal to the king at St. Albans, could venture to speak of the university as "schola secunda ecclesiæ," or second only to Paris. Its numbers about this time were probably some three thousand; but it was essentially a fluctuating body, and whenever plague or tumult led to a temporary dispersion a serious diminution in its numerical strength generally ensued for some time after. Against such vicissitudes the foundation of colleges proved the most effectual remedy. Of these the three earliest were University College, founded in 1249 by William of Durham; Balliol College, founded about 1263 by John Balliol, the father of the king of Scotland of the same name; and Merton College, founded in 1264. The last-named is especially notable as associated with a new conception of university education, namely, that of collegiate discipline for the secular clergy, instead of for any one of the religious orders, for whose sole benefit all similar foundations had hitherto been designed. The statutes given to the society by Walter de Merton are not less noteworthy, as characterized not only by breadth of conception, but also by a careful and discriminating attention to detail, which led to their adoption as the model for later colleges, not only at Oxford but at Cambridge. Of the service rendered by these foundations to the university at large we have significant proof in the fact that, although representing only a small numerical minority in the academic community at large, their members soon obtained a considerable preponderance in the administration of affairs.

The university of Cambridge, although it rose into existence somewhat later than Oxford, may

Cambridge. reasonably be held to have had its origin in the same century. There was probably a certain amount of educational work carried on by the canons of the church of St. Giles, which gradually developed into the instruction belonging to a regular studium. In the year 1112 the canons crossed the river and took up their residence in the new priory in Barnwell, and their work of instruction acquired additional importance. Then, as early as the year 1224, the Franciscans established themselves in the town, and, somewhat less than half a century later, were followed by the Dominicans. At both the English universities, as at Paris, the Mendicants and other religious orders were admitted to degrees, a privilege which, until the year 1337, was extended to them at no other university. Their interest in and influence at these three centres was consequently proportionably great. In the years 1231 and 1233 certain royal and papal letters afford satisfactory proof that by that time the university of Cambridge was already an organized body with a chancellor at its head; and in 1229 and 1231 its numbers were largely augmented by migrations from Paris and from Oxford. Cambridge, however, in its turn suffered from emigration; while in the year 1261, and again in 1322, the records of the university were wantonly burnt by the townsmen. Throughout the 13th century, indeed, the university was still only a very slightly and imperfectly organized community. Its endowments were of the most slender kind; it had no systematic code for the government of its members; the supervision of the students was very imperfectly provided for. An important step in the direction of reform in this last respect was, however, made in the year 1276, when an ordinance was passed requiring

that every one who claimed to be recognized as a scholar should have a fixed master within fifteen days after his entry into the university. But the feature which most served to give permanence and cohesion to the entire community was, as at Oxford, the institution of colleges. The earliest of these was Peterhouse, first founded as a separate institution by Hugh Balsham, bishop of Ely, in the year 1286,[1] with a code which was little more than a transcript of that given by Walter de Merton to his scholars at Oxford. About forty years later was founded Michaelhouse, and at nearly the same time (1326) Edward II. instituted his foundation of "king's scholars," afterwards forming the community of King's Hall. Both these societies in the 16th century were merged in Trinity College. To those succeeded Pembroke Hall (1347) and Gonville Hall (1348). All these colleges, although by no means conceived in a spirit of hostility to either the monastic or the Mendicant orders, were expressly designed for the benefit of the secular clergy. The foundation of Trinity Hall (1350) by Bishop Bateman, on the other hand, as a school of civil and canon law was probably designed to further ultramontane interests. That of Corpus Christi (1352), the outcome of the liberality of a guild of Cambridge townsmen, was conceived with the combined object of providing a house of education for the clergy, and at the same time securing the regular performance of masses for the benefit of the souls of departed members of the guild. But both Trinity Hall and Corpus Christi College, as well as Clare Hall, founded in 1359, were to a great extent indebted for their origin to the ravages caused among the clergy by the great plague of 1349.

Turning to France, or rather to the territory included within the boundaries of modern France, we find Montpellier a recognized school of medical science as early as the 12th century. William VIII., lord of Montpellier, in the year 1181 proclaimed it a school of free resort, where any teacher of medical science, from whatever country, might give instruction. Before the end of the century it possessed also a faculty of jurisprudence, a branch of learning for which it afterwards became famed. The university of medicine and that of law continued, however, to be totally distinct bodies with different constitutions. Petrarch was sent by his father to Montpellier to study the civil law. On 26th October, 1289, Montpellier was raised by Nicholas IV. to the rank of a "studium generale," a mark of favor which, in a region where papal influence was so potent, resulted in a considerable accession of prosperity. The university also now included a faculty of arts; and there is satisfactory evidence of the existence of a faculty of theology before the close of the 14th century, although not formally recognized by the pope before the year 1421. In the course of the same century several colleges for poor students were also founded. The university of Toulouse is to be noted as the first founded in any country by virtue of a papal charter. It took its rise in the efforts of Rome for the suppression of the Albigensian heresy, and its foundation formed one of the articles of the conditions of peace imposed by Louis IX. on Count Raymond of Toulouse. In the year 1233 it first acquired its full privileges as a "studium generale" by virtue of a charter given by Gregory IX. This pontiff watched over the university with especial solicitude, and through his exertions it soon became a noted centre of theological and especially of Dominican teaching. As a school of arts, jurisprudence, and medicine, although faculties of each existed, it never attained to any reputation. The university of Orleans had a virtual existence as a studium generale as early as the first half of the 13th century, but in the year 1305 Clement V. endowed it with new privileges, and gave its teachers permission to form themselves into a corporation. The schools of Orleans had an existence, it is said, as early as the 6th century, and subsequently supplied the nucleus for the foundation of a university at Blois; but of this university no records now exist.[2] Orleans, in its organization, was modelled mainly on Paris, but its studies were complementary rather than in rivalry to the older university. The absorbing character of the study of the civil law, and the mercenary spirit in which it was pursued, had led the authorities at Paris to refuse to recognize it as a faculty. The study found a home at Orleans, where it was cultivated with an energy which attracted numerous students. In January, 1235, we find the bishop of Orleans soliciting the advice of Gregory IX. as to the expediency of countenancing a study which was prohibited in Paris. Gregory decided that the lectures might be continued; but he ordered that no beneficed ecclesiastic should be allowed to devote himself to so eminently secular a branch of learning. Orleans subsequently incorporated a faculty of arts, but its reputation from this period was always that of a school of legal studies and in the 14th century its reputation in this respect was surpassed by no other university in Europe. Prior to the 13th century it had been famed for its classical learning; and Angers, which received its charter at the same time, also once enjoyed a like reputation, which, in a similar manner, it exchanged for that of a school for civilians and canonists. The roll of the university forwarded in 1378 to Clement VII. contains the names of 8 professors *utriusque juris*, 2 of civil and 2 of canon law, 72 licentiates, 284 bachelors of both the legal faculties, and 190 scholars. The university of Avignon was first recognized as a "studium generale" by Boniface VIII. in the year 1303, with power to grant degrees in jurisprudence, arts, and medicines. Its numbers declined somewhat during the residence of the popes, owing to the counter attractions of the "studium" attached to the curia; but after the return of the papal court to Rome it became one of the most frequented universities in France, and possessed at one time no less than seven colleges. The university of Cahors enjoyed the advantage of being regarded with especial favor by John XXII. In June, 1332, he conferred upon it privileges identical with those already granted to the university of Toulouse. In the following October, again following the precedent established at Toulouse, he appointed the *scholasticus* of the cathedral chancellor of the university. In November of the same year a bull, couched in terms almost identical with those of the Magna Charta of Paris, assimilated the constitution of Cahors to that of the oldest university. The two schools in France which, down to the close of the fourteenth century, most closely resembled Paris were Orleans and Cahors. The civil immunities and privileges of the latter university were not, however, acquired until the year 1367, when Edward III. of England, in his capacity as duke of Aquitaine, not only exempted the scholars from the payment of all taxes and imposts, but bestowed upon them the peculiar privilege known as *privilegium fori*. Cahors also received a license for faculties of theology and medicine, but, like Orleans, it was chiefly known as a school of jurisprudence. It was as a "studium generale" in the same three faculties that Grenoble, in the year 1339, received its charter from Benedict XII. The university never attained to much importance, and its annals are for the most part involved in obscurity. At the commencement of the 16th century it had ceased altogether to exist, was reorganized by Francis of Bourbon in 1542, and in 1565 was united to the university of Valence. founded, according to Denifle, in 1379 by Clement VII. (although tradition had previously ascribed its origin to Pedro IV., of Aragon), and that of Orange, founded in 1365 by Charles IV., were universities only by name and constitution, their names rarely appearing in contemporary chronicles, while their very existence becomes at times a matter for reasonable doubt.

Orange,

To some of the earlier Spanish universities—such as Palencia, founded about the year 1214 by Alfonso VIII.; Huesca, founded in 1354 by Pedro IV.; and Lerida, founded in 1300 by James II.—the same description is applicable; and their insignificance is probably indicated by the fact that they entirely failed to attract foreign students. Valladolid, founded in 1346 by Pope Clement VI., attained, however, to some celebrity; and the foreign teachers and students frequenting the university became so numerous that in 1373 King Henry II. caused an enactment to be passed for securing to them the same privileges as those already accorded to the native element. But the total number of the students in 1403 was only 116, and grammar and logic, along with jurisprudence (which was the principal study), constituted the sole curriculum. Whatever reputation, indeed, was enjoyed by Spain for nearly five centuries after the commencement of the university era, centred mainly in Salamanca, to which Seville, in the south, stood in the relation of a kind of subsidiary school, having been founded in 1254 by Alfonso the Wise, simply for the study of Latin and of the Semitic languages, especially Arabic. Salamanca was founded in 1243 by Ferdinand III. of Castile as a "studium generale" in the three faculties of jurisprudence, the arts, and medicine. Ferdinand extended his special protection to the students, granting them numerous privileges and immunities. Under his son Alfonso (above named) the university acquired a further development, and eventually included all the faculties save that of theology. But the main stress of its activity, as was the case with all the earlier Spanish universities, excepting only Palencia and Seville, until the commencement of the 15th century, was laid on the civil and the canon law. But, notwithstanding the favor with which Salamanca was regarded alike by the kings of Castile and by the Roman see, the provision for the payment of its professors was at first so inadequate and precarious that in 1298 they by common consent suspended their lectures, in consequence of their scanty remuneration. A permanent remedy for this difficulty was thereupon provided, by the appropriation of a certain portion of the ecclesiastical revenues of the diocese for the purpose of augmenting the professors' salaries. The earliest of the numerous colleges founded at Salamanca was that of St. Bartholomew, long noted for its ancient library and valuable collection of manuscripts, which now form part of the royal library in Madrid.

Palencia, Huesca, Lerida,

Valladolid,

Salamanca and Seville,

The one university possessed by Portugal had its seat in mediæval times alternately in Lisbon and in Coimbra, until, in the year 1537, it was permanently attached to the latter city. Its formal foundation took place in 1309, when it received from King Diniz a charter, the provisions of which were mainly taken from those of the charter given to Salamanca. In 1772 the university was entirely reconstituted.

Coimbra,

Of the German universities, Prague, which existed as a "studium" in the 13th century, was the earliest, and was at first frequented mainly by students from Styria and Austria, countries at that time ruled by the king of Bohemia. On 26th January, 1347, at the request of Charles IV., Pope Clement VI. promulgated a bull authorizing the foundation of a "studium generale" in all the faculties. In the following year Charles himself issued a charter for the foundation. This document, which, if original in character, would have been of much interest, has but few distinctive features of its own, its provisions being throughout adapted from those contained in the charters given by Frederick II. for the university of Naples and by Conrad for Salerno,—almost the only important feature of difference being that Charles bestows on the students of Prague all the civil privileges and immunities which were enjoyed by the teachers of Paris and Bologna. Charles had himself been a student in Paris, and the organization of his new foundation was modelled on that university, a like division into four "nations" (although with different names) constituting one of the most marked features of imitation. The numerous students—and none of the mediæval universities attracted in their early history a larger concourse—were drawn from a gradually widening area, which at length included, not only all parts of Germany, but also England, France, Lombardy, Hungary, and Poland. Contemporary writers, with the exaggeration characteristic of mediæval credulity, even speak of thirty thousand students as present in the university at one time,—a statement for which Denifle proposes to substitute two thousand as a more probable estimate. It is certain, however, that Prague, prior to the foundation of Leipsic, was one of the most frequented centres of learning in Europe, and Paris suffered a considerable diminution in her numbers owing to the counter attractions of the great studium of Slavonia.

Prague,

The university of Cracow in Poland was founded in May, 1364, by virtue of a charter given by King Casimir the Great, who bestowed on it the same privileges as those possessed by the universities of Bologna and Padua. In the following September Urban V., in consideration of the remoteness of the city from other centres of education, constituted it a "studium generale" in all the faculties save that of theology. It is, however, doubtful whether these designs were carried into actual realization, for it is certain that, for a long time after the death of Casimir, there was no university whatever. Its real commencement must accordingly be considered to belong to the year 1400, when it was reconstituted, and the papal sanction was given for the incorporation of a faculty of theology. From this time its growth and prosperity were continuous; and with the year 1416 it had so far acquired a European reputation as to venture upon forwarding an expression of its views in connection with the deliberations of the council of Constance. Towards the close of the 15th century the university is said to have been in high repute as a school of both astronomical and humanistic studies.

Cracow,

The Avignonese popes appear to have regarded the establishment of new faculties of theology with especial jealousy; and when, in 1364, Duke Rudolph IV. founded the university of Vienna, with the design of constituting it a "studium generale" in all the faculties, Urban V. refused his consent to the foundation of a theological school. Owing to the sudden death of Duke Rudolph, the university languished for the next twenty years, but after the accession of Duke Albert III., who may be regarded as its real founder, it acquired additional privileges, and its prosperity became marked and continuous. Like Prague, Vienna was for a long time distinguished by the comparatively little attention bestowed by its teachers on the study of the civil law.

Vienna,

No country in the 14th century was looked upon with greater disfavor at Rome than Hungary. It was stigmatized as the land of heresy and schism. When, accordingly, in 1367 King Louis applied to Urban V. for his sanction of the scheme of founding a university at Fünfkirchen, although theological learning was in special need of encouragement in those regions, Urban would not consent to the foundation of a faculty of theology; he even made it a condition of his sanction for a "studium generale" that King Louis should first undertake

Fünfkirchen,

to provide for the payment of the professors. We hear but little concerning the university after its foundation, and it is doubtful whether it survived for any length of time the close of the century, having been about that period absorbed in all probability in the university of Ofen. The foundation of this university is also involved in considerable obscurity, and its original charter is lost. We only know that it was granted by Boniface IX., at the request of King Sigismund, in the year 1389. In the first half of the 15th century it ceased for a long period to exist, but was revived, or rather founded afresh, by King Mathias Corvinus, an eminent patron of learning, in the last quarter of the century. "The extreme east of civilized continental Europe in mediæval times," observes Denifle, "can be compared, so far as university education is concerned, only with the extreme west and the extreme south. In Hungary, as in Portugal and in Naples, there was constant fluctuation, but the west and the south, although troubled by yet greater commotions than Hungary, bore better fruit. Among all the countries possessed of universities in mediæval times, Hungary occupies the lowest place—a state of affairs of which, however, the proximity of the Turk must be looked upon as a main cause."

Ofen.

The university of Heidelberg received its charter (23d October, 1385) from Urban VI. as a "studium generale" in all the recognized faculties save that of the civil law,—the form and substance of the document being almost identical with those of the charter granted to Vienna. It was granted at the request of the elector palatine, Rupert I., who conferred on the teachers and students, at the same time, the same civil privileges as those which belonged to the university of Paris. In this case the functionary invested with the power of bestowing degrees was non-resident, the licenses being conferred by the provost of the cathedral at Worms. But the real founder, as he was also the organizer and teacher, of the university was Marsilius of Inghen, to whose ability and energy Heidelberg was indebted for no little of its early reputation and success. The omission of the civil law from the studies licensed in the original charter would seem to show that the pontiff's compliance with the elector's request was merely formal, and Heidelberg, like Cologne, included the civil law among its faculties almost from its first creation. No mediæval university achieved a more rapid and permanent success. Regarded with favor alike by the civil and ecclesiastical potentates, its early annals were singularly free from crises like those which characterize the history of many of the mediæval universities. The number of those admitted to degrees from the commencement of the first session (19th October, 1386, to 16th December, 1387) amounted to 579.[1]

Heidelberg.

Owing to the labors of the Dominicans, Cologne had gained a reputation as a seat of learning long before the founding of its university; and it was through the advocacy of some leading members of the Mendicant orders that, at the desire of the city council, its charter as a "studium generale" (21st May, 1388) was obtained from Urban VI. It was organized on the model of the university of Paris, as a school of theology and canon law, and "any other recognized faculty,"—the civil law being incorporated as a faculty soon after the promulgation of the charter. In common with the other early universities of Germany—Prague, Vienna, and Heidelberg—Cologne owed nothing to imperial patronage, while it would appear to have been, from the first, the object of special favor with Rome. This circumstance serves to account for its distinctly ultramontane sympathies in mediæval times and even far into the 16th century. In a report transmitted to Gregory XIII. in 1577, the university expressly derives both its first origin and its privileges from the Holy See, and professes to owe no allegiance save to the Roman pontiff.

Cologne.

Erfurt, no less noted as a centre of Franciscan than was Cologne of Dominican influence, received its charter (16th September, 1379) from the anti-pope Clement VII. as a "studium generale" in all the faculties. Ten years later (4th May, 1389) it was founded afresh by Urban VI., without any recognition of the act of his pretended predecessor. In the 15th century the number of its students was larger than that at any other German university—a fact attributable partly to the reputation it had acquired as a school of jurisprudence, and partly to the ardor with which the philosophic controversies of the time were debated in its midst.

Erfurt.

The collegiate system is to be noted as a feature common to all these early German universities; and, in nearly all, the professors were partly remunerated by the appropriation of certain prebends, appertaining to some neighboring church, to their maintenance.

Throughout the 15th century the relations of the Roman pontiffs to the universities continued much the same, although the independent attitude assumed at the great councils of Constance and Basel by the deputies from the universities, and especially by those from Paris, could not fail to excite their apprehensions. Their bulls for each new foundation begin again to indicate a certain jealousy with respect to the appropriation of prebends by the founders. Where such appropriations are made, and more particularly in France, a formal sanction of the transfer generally finds a place in the bull authorizing the foundation; while sometimes the founder or founders are themselves enjoined to provide the endowments requisite for the establishment and support of the university. In this manner the control of the pontiff over each newly-created seat of learning assumed a more real character, from the fact that his assent was accompanied by conditions which rendered it no longer a mere formality. The imperial intervention, on the other hand, was rarely invoked in Germany,—Greifswald, Freiburg, and Tübingen being the only instances in which the emperor's confirmation of the foundation was solicited.[2] But whatever influence the Roman see may have gained by increasing intervention was more than counteracted by those other tendencies which came into operation in the second half of the century. These were of a twofold character: the first directly modifying the studies themselves, as the results of the discovery of printing and the new spirit awakened by the teaching of the humanists; the second affecting the external conditions, such as the multiplication of schools, and the growing demand for skilled physicians and learned civilians,—circumstances which afforded increased employment for the services of men of academic training. In northern Germany and the Netherlands, the growing wealth and prosperity of the different states especially favored the formation of new centres of learning. In the flourishing duchy of Brábant the university of Louvain (1426) was to a great extent controlled by the municipality; and their patronage, although ultimately attended with detrimental results, long enabled Louvain to outbid all the other universities of Europe in the munificence with which she rewarded her professors. In the course of the next century the "Belgian Athens," as she is styled by Lipsius, ranked second only to Paris in numbers and reputation. In its numerous separate foundations and general organization—it possessed no less than twenty-eight colleges—it closely resembled the English universities; while its active press afforded facilities to the author and the controversialist of

Relations of the popes to the universities.

Foundation of Louvain.

[1] The statistics of Hautz (*Gesch. de Univ. Heidelberg*, i. 177–8) are corrected by Denifle (*Die Entstehung der Universitäten*, p. 385).

which both Cambridge and Oxford were at that time almost destitute. It embraced all the faculties, and no degrees in Europe stood so high as guarantees of general acquirements. Erasmus records it as a common saying, that "no one could graduate at Louvain without knowledge, manners, and age." Sir William Hamilton speaks of the examination at Louvain for a degree in arts as "the best example upon record of the true mode of such examination, and, until recent times, in fact, the only example in the history of universities worthy of consideration at all." He has translated from Vernulæus the order and method of this examination.[1] In 1788 the faculties of jurisprudence, medicine, and philosophy were removed to Brussels, and in 1797 the French suspended the university altogether. When Belgium was formed into an independent state in 1831, the university was refounded as a Roman Catholic foundation.

Leipsic, The circumstances of the foundation of the university of Leipsic are especially noteworthy, it having been the result of the migration of almost the entire German element from the university of Prague. This element comprised (1) Bavarians, (2) Saxons, (3) Poles (this last-named division being drawn from a wide area, which included Meissen, Lusatia, Silesia, and Prussia), and, being represented by three votes in the assemblies of the university, while the Bohemians possessed but one, had acquired a preponderance in the direction of affairs which the latter could no longer submit to. Religious differences, again, evoked mainly by the preaching of John Huss, further intensified the existing disagreements; and eventually, in the year 1409, king Wenceslaus, at the prayer of his Bohemian subjects, issued a decree which exactly reversed the previous distribution of votes,—three votes being assigned to the Bohemian nation and only one to all the rest. The Germans took deep umbrage, and seceded to Leipsic, where, a bull having been obtained from Alexander V. (9th September, 1409), a new "studium generale" was founded by the landgrave of Thuringia and the margraves of Meissen. The members were divided into four nations—composed of natives of Meissen, Saxony, Bavaria, and Poland. Two colleges were founded, a greater and a smaller, but designed, not for poor students, but for masters of arts,—twelve being admitted on the former and eight on the latter foundation. The first university of northern Germany was that of Rostock, Rostock, founded by the dukes John and Albert of Mecklenburg, the scheme receiving the sanction of Martin V. in a bull dated 13th February, 1419, as that of a "studium generale" in all the faculties excepting theology. The faculty of theology was added in the year 1432. Two colleges were also founded, with the same design and on the same scale as at Leipsic.

No little illustration is afforded by the circumstances attending the foundation of the French universities of the struggle that was going on between the crown and the Roman see. The earliest foundation in the Poitiers, 15th century was that of Poitiers. It was instituted by Charles VII. in 1431, almost immediately after his accession, with the special design of creating a centre of learning less favorable to English interests than Paris had at that time shown herself to be. Eugenius IV. could not refuse his sanction to the scheme, but he endeavored partially to defeat Charles's design by conferring on the new "studium generale" only the same privileges as those possessed by Toulouse, and thus placing it at a disadvantage in comparison with Paris. Charles rejoined by an extraordinary exercise of his own prerogative, conferring on Poitiers all the privileges collectively possessed by Paris, Toulouse, Montpellier, Angers, and Orleans, and at the same time placing the university under special royal protection. The foundation of the university of Caen, in the diocese of Bayeux, was attended by conditions almost exactly the reverse of those which belonged to the foundation of that at Poitiers. It was founded under English auspices during the short period of the supremacy of the English arms in Normandy in the 15th century. Its charter (May, 1437) was given by Eugenius IV., and the bishop of Bayeux was appointed its chancellor. The university of Paris had by this time completely forfeited the favor of Eugenius by its attitude at the council of Basel, and Eugenius inserted in the charter for Caen a clause of an entirely novel character, requiring all those admitted to degrees to take an oath of fidelity to the see of Rome, and to bind themselves to attempt nothing prejudicial to her interests. To this proviso the pragmatic sanction of Bourges was the reply given by Charles in the following year. On 18th May, 1442, we find King Henry VI. writing to Eugenius, and dwelling with satisfaction on the rapid progress of the new university, to which, he says, students had flocked from all quarters, and were still daily arriving.[2] On 30th October, 1452, its charter was given afresh by Charles in terms which left the original charter unrecognized; both teachers and learners were made subject to the civil authorities of the city, while all privileges conferred in the former charter in cases of legal disputes were abolished. From this time the university of Caen was distinguished by its loyal spirit and firm resistance to ultramontane pretensions; and, although swept away at the French Revolution it was afterwards restored, owing to the sense of the services it had thus once rendered to the national cause.[3] No especially notable circumstances characterize the foundation of the university of Bordeaux (1441) or that of Valence (1452), but that of Nantes, which received its charter from Pius II. in 1463, is distinguished by the fact that it did not receive the ratification of the king of France, and the conditions under which its earlier traditions were formed thus closely resemble those of Poitiers. It seems also to have been regarded with particular favor by Pius II., a pontiff who was at once a ripe scholar and a writer upon education. He gave to Nantes a notable body of privileges, which not only represent an embodiment of all the various privileges granted to universities prior to that date, but afterwards became, with their copious and somewhat tautological phraseology, the accepted model for the great majority of university charters, whether issued by the pope or by the emperor, or by the civil authority. The bishop of Nantes was appointed head of the university, and was charged with the special protection of its privileges against all interference from whatever quarter.[4] The bull for the foundation of the university of Bourges was given in 1465 by Paul II. at the request of Louis XI. and his brother. It confers on the community the same privileges as those enjoyed by the other universities of France. The royal sanction was given at the petition of the citizens; but, from reasons which do not appear, they deemed it necessary further to petition that their charter might also be registered and enrolled by the parlement of Paris.

Caen, Bordeaux, Valence, Nantes, Bourges,

In Germany, the first of the universities representing the new influences above referred to is Greifswald, that of Greifswald. A wealthy burgomaster, who had graduated as a master of arts at Rostock, was the chief mover; and, his proposal being cordially seconded by the city council, the duke of the province, and certain abbots of neighboring monasteries, the necessary bull was obtained from Calixtus III. (29th May, 1456). The first session was commenced in October of the same year. Three colleges

[4] Meiners, i. 368.

were at the same time founded,—two for masters of arts, as at Leipsic and Rostock, and a third for jurists. The chairs in the different faculties were distributed as follows: theology 3, jurisprudence 5, medicine 1, arts 4,—the number of jurists showing that the study of the civil law still obtained a certain preponderance. The university of Freiburg was founded by the archduke Albert, brother of the emperor Frederick III.,—the papal bull being given 20th April, 1455, and the imperial ratification in the following year. The first session was opened in 1460, under the presidency of Matthew Hummel, a privy councillor, and the original numbers soon received considerable additions by secessions from Vienna and from Heidelberg. The endowment was further augmented by an annual allowance from the city council, and by certain canonries and livings attached to neighboring parishes. In the same year, and probably in a spirit of direct rivalry, was opened the university of Basel. The cathedral school in that ancient city, together with others attached to the monasteries, afforded a sufficient nucleus for a "studium," and Pius II., who, as Æneas Sylvius, had been a resident in the city, was easily prevailed upon to grant the charter (12th November, 1459). In the character of its endowments, and in the relative importance attached to the study of the civil law, Basel much resembled Greifswald, but its success throughout the 15th century was marred by the languid character of the support afforded it by the civic authorities. Before he had signed the bull for the foundation of the university of Basel, Pius II., at the request of duke William of Bavaria, had issued another bull for the foundation of a university at Ingolstadt (7th April, 1459). But it was not until 1472 that the work of teaching was actually commenced there. Some long-existing prebends, founded by former dukes of Bavaria, were appropriated to the endowment, and the chairs in the different faculties were distributed as follows: theology 2, jurisprudence 3, medicine 1, arts 6,—arts in conjunction with theology thus obtaining the preponderance. As at Caen, twenty-two years before, an oath of fidelity to the Roman pontiff was imposed on every student admitted to a degree.[1] That this proviso was not subsequently abolished, as at Caen, is a feature in the history of the university of Ingolstadt which was attended by important results. Nowhere did the Reformation meet with more stubborn resistance, and it was at Ingolstadt that the Counter-Reformation was commenced. In 1556 the Jesuits made their first settlement in the university.

Freiburg, Basel, Ingolstadt,

The next two universities took their rise in the archiepiscopal seats of Treves and Mainz. That at Treves received its charter as early as 1450; but the first academical session did not commence until 1473. Here the ecclesiastical influences appear to have been unfavorable to the project. The archbishop demanded 2000 florins as the price of his sanction. The cathedral chapter threw difficulties in the way of the appropriation of certain livings and canonries to the university endowment; and so obstinate was their resistance that in 1655 they succeeded in altogether rescinding the gift on payment of a very inadequate sum. It was not until 1722 that the assembly of deputies, by a formal grant, relieved the university from the difficulties in which it had become involved. The university of Mainz, on the other hand, was almost entirely indebted to the archbishop Diether for its foundation. It was at his petition that Sixtus IV. granted the charter, 23d November, 1476; and Diether, being himself an enthusiastic humanist, thereupon circulated a letter, couched in elegant Latinity, addressed to students throughout his diocese, inviting them to repair to the new centre, and dilating on the advantages of academic studies and of learning. The rise of these two universities, however, neither of which attained to much distinction, represents little more than the incorporation of certain already existing institutions into a homogeneous whole, the power of conferring degrees being superadded. But the university of Tübingen, founded by charter of Sixtus IV. (9th November, 1476), represents an entirely new creation. Its real founder was Mathilda, the mother of Count Eberhard of Würtemberg, who appropriated five livings and eight prebends to the endowment. Of the chairs, 3 were for theology, 3 for the canon and 2 for the civil law, 2 for medicine, and 4 for arts. The general financial condition of this university in the year 1541–42, and the sources from whence its revenues were derived, have been illustrated by Hoffmann in a short paper which shows the fluctuating character of the resources of a university in those days,—liable to be affected, as they were, both by the seasons and the markets.[2]

Treves, Mainz, Tübingen,

Nearly contemporaneous with these foundations were those of Upsala (1477) and Copenhagen (1479), which, although lying without the political boundaries of Germany, reflected her influence. The charter for Copenhagen was given by Sixtus IV. as early as 1475. The students attracted to this new centre were mainly from within the radius of the university of Cologne, and its statutes were little more than a transcript of those of the latter foundation.

Upsala and Copenhagen,

The electorates of Wittenberg and Brandenburg were now the only two considerable German territories which did not possess a studium generale, and the university founded at Wittenberg by Maximilian I. (6th July, 1502) is notable as the first established in Germany by virtue of an imperial as distinguished from a papal decree. Its charter is, however, drawn up with the traditional phraseology of the pontifical bulls, and is evidently not conceived in any spirit of antagonism to Rome. Wittenberg is constituted a "studium generale" in all the four faculties,—the right to confer degrees in theology and canon law having been sanctioned by the papal legate some months before, 2d February, 1502. The endowment of the university with church revenues duly received the papal sanction,—a bull of Alexander VI. authorizing the appropriation of twelve canonries attached to the castle church, as well as of eleven prebends in outlying districts—*ut sic per omnem modum unum corpus ex studio et collegio prædictis fiat et constituatur.* No university in Germany attracted to itself a larger share of the attention of Europe at its commencement. And it was its distinguishing merit that it was the first academic centre north the Alps where the antiquated methods and barbarous Latinity of the scholastic era were overthrown. The last university founded in Germany prior to the Reformation was that of Frankfort-on-the-Oder. The design, first conceived by the elector John of Brandenburg, was carried into execution by his son Joachim, at whose request Pope Julius II. issued a bull for the foundation, 15th March, 1506. An imperial charter, identical in its contents with the papal bull, followed on 26th October. The university received an endowment of canonries and livings similar to that of Wittenberg, and some houses in the city were assigned for its use by the elector.

Wittenberg, Frankfort-on-the-Oder,

The first university in Scotland was that of St. Andrews, founded in 1411 by Henry Wardlaw, bishop of that see, and modelled chiefly on the constitution of the university of Paris. It acquired all its three colleges—St. Salvator's,

St. Andrews,

[1] Paulsen, in speaking of this proviso as one "die weder vorher noch nachher sonst vorkommt," would consequently seem to be not quite accurate. See *Die Gründung der deutschen Universitäten*, p. 277.

[2] *Oekonomischer Zustand der Universität Tübingen gegen die Mitte des 16ten Jahrhunderts*, 1845.

St. Leonard's, and St. Mary's—before the Reformation,—the first having been founded in 1456 by Bishop James Kennedy; the second in 1512 by the youthful archbishop Alexander Stuart (natural son of James IV.) and John Hepburn, the prior of the monastery of St. Andrews; and the third, also in 1512, by the Beatons, who in the year 1537 procured a bull from Pope Paul III. dedicating the college to the Blessed Virgin Mary of the Assumption, and adding further endowments. The most ancient of the universities of Scotland, with its three colleges, was thus reared in an atmosphere of mediæval theology, and undoubtedly designed as a bulwark against heresy and schism. But "by a strange irony of fate," it has been observed, "two of these colleges became, almost from the first, the foremost agents in working the overthrow of that church which they were founded to defend." St. Leonard's more especially, like St. John's or Queens' at Cambridge, became a noted centre of intellectual life and Reformation principles. That he "had drunk at St. Leonard's well" became a current expression for implying that a theologian had imbibed the doctrines of Protestantism. The university of Glasgow was founded as a "studium generale" in 1453, and possessed two colleges. Prior to the Reformation it acquired but little celebrity; its discipline was lax, and the number of the students but small, while the instruction was not only inefficient but irregularly given; no funds were provided for the maintenance of regular lectures in the higher faculties; and there was no adequate executive power for the maintenance of discipline. The university of Aberdeen, which was founded in 1494, at first possessed only one college,—namely, King's. Marischal College, founded in 1593 by George Keith, fifth Earl Marischal, was constituted by its founder independent of the university in Old Aberdeen, being itself both a college and a university, with the power of conferring degrees. Bishop Elphinstone, the founder both of the university and of King's College (1505), had been educated at Glasgow, and had subsequently both studied and taught at Paris and at Orleans. To the wider experience which he had thus gained we may probably attribute the fact that the constitution of the university of Aberdeen was free from the glaring defects which then characterized that of the university of Glasgow.[1] But in all the mediæval universities of Germany, England, and Scotland, modelled as they were on a common type, the absence of adequate discipline was, in a greater or less degree, a common defect. In connection with this feature we may note the comparatively small percentage of matriculated students proceeding to the degrees of B.A. and M.A. when compared with later times. Of this disparity Table I., exhibiting the relative numbers in the university of Leipsic for every ten years from the year 1427 to 1552, probably affords a fair average illustration,—the remarkable fluctuations probably depending quite as much upon the comparative healthiness of the period (in respect of freedom from epidemic) and the abundance of the harvests as upon any other cause.

Glasgow.

Aberdeen.

Degrees taken at Leipsic.

The German universities in these times seem to have admitted for the most part their inferiority in learning to older and more favored centres; and their consciousness of the fact is shown by the efforts which they made to attract instructors from Italy, and by the frequent resort of the more ambitious students to schools like Paris, Bologna, Padua, and Pavia. That they took their rise in any spirit of systematic opposition to the Roman see (as Meiners and others have contended), or that their organization was something external to and independent of the church, is sufficiently disproved by the foregoing evidence. Generally speaking, they were eminently conservative bodies, and the new learning of the humanists and the new methods of instruction that now began to demand attention were alike for a long period unable to gain admission

within academic circles. Reformers such as Hegius, John Wessel, and Rudolphus Agricola carried on their work at places like Deventer remote from university influences. That there was a considerable amount of mental activity going on in the universities themselves is not to be denied; but it was mostly of that unprofitable kind which, while giving rise to endless controversy, turned upon questions in connection with which the implied postulates and the terminology employed rendered all scientific investigation hopeless. At almost every university—Leipsic, Greifswald, and Prague (after 1209[2]) being the principal exceptions—the so-called Realists and Nominalists represented two great parties occupied with an internecine struggle. At Paris, owing to the overwhelming strength of the theologians, the Nominalists were indeed under a kind of ban; but at Heidelberg they had altogether expelled their antagonists. It was much the same at Vienna and at Erfurt,—the latter, from the ready reception which it gave to new speculation, being styled by its enemies "novorum omnium portus." At Basel, under the leadership of the eminent Johannes a Lapide, the Realists with difficulty maintained their ground. Freiburg, Tübingen, and Ingolstadt, in the hope of diminishing controversy, arrived at a kind of compromise, each party having its own professor, and representing a distinct "nation." At Mainz the authorities adopted a manual of logic which was essentially an embodiment of Nominalistic principles.

In Italy, almost without exception, it was decided that these controversies were endless, and that their effects were pernicious. It was resolved, accordingly, to expel logic, and allow its place to be filled by rhetoric. It was by virtue of this decision, which was of a tacit rather than a formal character, that the expounders of the new learning in the 15th century, men like Emmanuel Chrysoloras, Guarino, Leonardo Bruni, Bessarion, Argyropulos, and Valla, carried into effect that important revolution in academic studies which constitutes a new era in university learning, and largely helped to pave the way for the Reformation.[3] This discouragement of the controversial spirit, continued as it was in relation to theological questions after the Reformation, obtained for the Italian universities a fortunate immunity from dissensions like those which, as we shall shortly see, distracted the centres of learning in Germany. The professorial body also attained to an almost unrivalled

Abandonment of logical studies in Italy.

1 *Fasti Aberdonenses*, Pref. p. xvi.

2 [The date 1409 would seem to be intended when several thousands of students left Prague and founded the university of Leipsic. The university of Prague was founded in 1348. See vol. xii. p. 420 and vol. xix. p. 678.—Am. Ed.]

3 For an excellent account of this movement, see Georg Voigt, *Die Wiederbelebung des classischen Alterthums*, 2d ed., 2 vols., 1880.

reputation. It was exceptionally select, only those who were in receipt of salaries being permitted, as a rule, to lecture; it was also famed for its ability, the institution of concurrent chairs proving an excellent stimulus. These chairs were of two kinds—"ordinary" and "extraordinary,"—the former being the more liberally endowed and fewer in number. For each subject of importance there were thus always two and sometimes three rival chairs, and a powerful and continuous emulation was thus maintained among the teachers. "From the integrity of their patrons, and the lofty standard by which they were judged," says Sir W. Hamilton, "the call to a Paduan or Pisan chair was deemed the highest of all literary honors. The status of professor was in Italy elevated to a dignity which in other countries it has never reached; and not a few of the most illustrious teachers in the Italian seminaries were of the proudest nobility of the land. While the universities of other countries had fallen from Christian and cosmopolite to sectarian and local schools, it is the peculiar glory of the Italian that, under the enlightened liberality of their patrons, they still continued to assert their European universality. Creed and country were in them no bar,—the latter not even a reason of preference. Foreigners of every nation are to be found among their professors; and the most learned man in Scotland (Dempster) sought in a Pisan chair that theatre for his abilities which he could not find at home."[1]

High reputation of Italian professors.

The Reformation represents the great boundary line in the history of the mediæval universities, and also, for a long time after, the main influence in the history of those new foundations which subsequently arose in Protestant countries. Even in Catholic countries its secondary effects were scarcely less perceptible, as they found expression in connection with the Counter-Reformation. In Germany the Thirty Years' War was attended by consequences which were felt long after the 17th century. In France the Revolution of 1789 resulted in the actual uprooting of the university system.

Events producing divisions in university history.

The influences of the New Learning, and the special character which it assumed as it made its way in Germany in connection with the labors of scholars like Erasmus, John Reuchlin, Ulrich von Hutten, and Melanchthon, augured well for the future. It was free from the frivolities, the pedantry, the immoralities, and the skepticism which characterized so large a proportion of the corresponding culture in Italy. It gave promise of resulting at once in a critical and enlightened study of the masterpieces of classical antiquity, and in a reverent and yet rational interpretation of the Scriptures and the fathers. The fierce bigotry and the ceaseless controversies evoked by the promulgation of Lutheran or Calvinistic doctrine dispelled, however, this hopeful prospect, and converted what might otherwise have become the tranquil abodes of the Muses into gloomy fortresses of sectarianism. Of the manner in which it affected the highest culture, the observation of Henke in his *Life of Calixtus* (i. 8), that for a century after the Reformation the history of Lutheran theology becomes almost identified with that of the German universities, may serve as an illustration.

Pernicious influences of sectarianism.

The first Protestant university was that of Marburg, founded by Philip the Magnanimous, landgrave of Hesse, 30th May, 1527. Expressly designed as a bulwark of Lutheranism, it was mainly built up out of the confiscation of the property of the religious orders in the Hessian capital. The house of the Dominicans, who had fled on the first rumor of spoliation, was converted into lecture-rooms for the faculty of jurisprudence. The church and convent of the order known as the "Kugelherrn" was appropriated to the theological faculty. The friary of the Barefooted Friars was shared between the faculties of medicine and philosophy. The university, which was the object of the margrave's peculiar care, rapidly rose to celebrity; it was resorted to by students from remote countries, even from Greece, and its professors were of distinguished ability. How much, however, of this popularity depended on its theological associations is to be seen in the fact that after the year 1605, when, by the decree of Count Maurice, its formulary of faith was changed from Lutheran to Calvinistic, its numbers greatly declined. This dictation of the temporal power now becomes one of the most notable features in academic history in Protestant Germany. The universities, having repudiated the papal authority, while that of the episcopal order was at an end, now began to pay especial court to the temporal ruler, and sought in every way to conciliate his goodwill, representing with peculiar distinctness the theory,—*cujus regio, ejus religio*. This tendency was further strengthened by the fact that their colleges, bursaries, and other similar foundations were no longer derived from or supported by ecclesiastical institutions, but were mainly dependent on the civil power.

Marburg.

The Lutheran university of Königsberg was founded 17th August, 1544, by Albert III., margrave of Brandenburg, and the first duke of Prussia, and his wife Dorothea, a Danish princess. In this instance, the religious character of the foundation not having been determined at the commencement, the papal and the imperial sanction were both applied for, although not accorded. King Sigismund, of Poland, however, which kingdom exercised at that time a protectorate over the Prussian duchy, ultimately gave the necessary charter (29th September, 1561), at the same time ordaining that all students who graduated as masters in the faculty of philosophy should rank as nobles of the Polish kingdom. When Prussia was raised to the rank of a kingdom (1701) the university was made a royal foundation, and the "collegium Fridericianum," which was then erected, received corresponding privileges. In 1862 the university buildings were rebuilt, and the number of the students is now nearly one thousand.

Königsberg.

The Lutheran university of Jena had its origin in a gymnasium founded by John Frederick the Magnanimous, elector of Saxony, during his imprisonment, for the express purpose of promoting Evangelical doctrines and repairing the loss of Wittenberg, where the Philippists had gained the ascendency. Its charter, which the emperor Charles V. refused to grant, and which was obtained with some difficulty from his brother, Ferdinand I., eventually enabled the authorities to open the university, 2d February, 1558. Distinguished for its vehement assertion of Lutheran doctrine, its hostility to the teaching of Wittenberg was hardly less pronounced than that with which both centres regard Roman Catholicism. For a long time it was chiefly noted as a school of medicine, and in the 17th and 18th centuries it was in bad repute for the lawlessness of its students, among whom duelling prevailed to a scandalous extent. The beauty of its situation and the eminence of its professoriate have, however, generally attracted a considerable proportion of students from other countries. Its numbers in 1885 were 566.

Jena.

The Lutheran university of Helmstädt, founded by Duke Julius (of the house of Brunswick-Wolfenbüttel), and designated after him in its official records as "Academia Julia," received its charter, 8th May, 1575, from the emperor Maximilian II. No university in the 16th century commenced under more favorable auspices. It was munificently endowed by the founder and by his son; and its "Convictorium," or college for poor students, expended in the course of thirty years no less than

Helmstädt.

[1] Hamilton, *Discussions*, 2d ed., p. 373.

100,000 thalers [$72,600], an extraordinary expenditure for an institution of such a character in those days. Beautifully and conveniently situated in what had now become the well-peopled region between the Weser and the lower Elbe, and distinguished by its comparatively temperate maintenance of the Lutheran tenets, it attracted a considerable concourse of students, especially from the upper classes, not a few being of princely rank. Throughout its history, until suppressed in 1809, Helmstädt enjoyed the special and powerful patronage of the dukes of Saxony.

Altdorf.

The "Gymnasium Ægidianum" of Nuremberg, founded in 1526, and removed in 1575 to Altdorf, represents the origin of the university of Altdorf. A charter was granted in 1578 by the emperor Rudolph II., and the university was formally opened in 1580. It was at first, however, empowered only to grant degrees in arts; but in 1623 the emperor Ferdinand II. added the permission to create doctors of law and medicine, and also to confer crowns on poets; and in 1697 its faculties were completed by the permission given by the emperor Leopold I. to create doctors of theology. Like Louvain, Altdorf was nominally ruled by the municipality, but in the latter university this power of control remained practically inoperative, and the consequent freedom enjoyed by the community from evils like those which brought about the decline of Louvain is thus described by Hamilton: "The decline of that great and wealthy seminary (Louvain) was mainly determined by its vicious patronage, both as vested in the university and in the town. Altdorf, on the other hand, was about the poorest university in Germany, and long one of the most eminent. Its whole endowment never rose above £800 [$3888] a year; and, till the period of its declension, the professors of Altdorf make at least as distinguished a figure in the history of philosophy as those of all the eight universities of the British empire together. On looking closely into its constitution the anomaly is at once solved. The patrician senate of Nuremberg were too intelligent and patriotic to attempt the exercise of such a function. The nomination of professors, though formally ratified by the senate, was virtually made by a board of four curators; and what is worthy of remark, as long as curatorial patronage was a singularity in Germany, Altdorf maintained its relative pre-eminence, losing it only when a similar mean was adopted in the more favored universities of the empire."[1]

Giessen.

The conversion of Marburg into a school of Calvinistic doctrine gave occasion to the foundation of the universities of Giessen and of Rinteln. Of these the former, founded by the margrave of Darmstadt, Louis V., as a kind of refuge for the Lutheran professors from Marburg, received its charter from the emperor Rudolph II., 19th May, 1607. When, however, the margraves of Darmstadt acquired possession of Marburg in 1625, the university was transferred thither; in 1650 it was moved back again to Giessen. The number of matriculated students at the commencement of the century was about 250; in 1887 it was 484. In common with the other universities of Germany, but with a facility which obtained for it a specially unenviable reputation, Giessen was for a long time wont to confer the degree of doctor *in absentia* in the different faculties without requiring adequate credentials. This practice, however, which drew forth an emphatic protest from the eminent historian Mommsen, has within the last few years been entirely abandoned.

Rinteln.

The university of Rinteln was founded 17th July, 1621, by the emperor Ferdinand II. Almost immediately after its foundation it became the prey of contending parties in the Thirty Years' War, and its early development was thus materially hindered. It never, however, attained to much distinction, and in 1819 it was suppressed.

Strasburg.

The university of Strasburg was founded in 1621 on the basis of an already existing academy, to which the celebrated John Sturm stood, during the latter part of his life, in the relation of "rector perpetuus," and of which we are told that in 1578 it included more than a thousand scholars, among whom were 200 of the nobility, 24 counts and barons, and three princes. It also attracted students from all parts of Europe, and especially from Portugal, Poland, Denmark, France, and England. The method of Sturm's teaching became the basis of that of the Jesuits, and through them of the public school instruction in England. In 1621 Ferdinand II. conferred on this academy full privileges as a university; in the language of the charter, "in omnibus facultatibus, doctores, licentiatos, magistros, et baccalaureos, atque insuper *poetas laureatos* creandi et promovendi."[2] In 1681 Strasburg became French, and remained so until 1870.

Dorpat.

The university of Dorpat (now Russian) was founded by Gustavus Adolphus in 1632, and reconstituted by the emperor Alexander I. in 1802. A special interest attaches to this university from the fact that it has for a long time been the scene of the contending influences of Teutonism and Slavonianism. Situated in Livonia, which at the time of its foundation represented a kind of debatable land between Russia and Poland, its gradual monopoly by the former country has not been without resistance and protests on the part of that Teutonic element which was at one time the more potent in its midst. The study of the Slavonic languages has here received considerable stimulus, and by a decree in May, 1887, the use of the Russian language having been made obligatory in all places of instruction through the Baltic provinces, Russian has now taken the place of German as the language of the lecture-room. Dorpat possesses a fine library of over 80,000 volumes, and is also noted for its admirable botanical collection. The Russian minister has also recently instituted a professorship of the comparative grammar of the Slavonic dialects (now filled by J. Baudouin de Courtenay). The general influence of the university has been rapidly extending during the last few years far beyond the Baltic provinces. The number of students, which in 1879 was 1106, in 1886 was 1751.[3]

Prague.

A like contest between contending nationalities has recently met with a final solution at Prague, where a Czech university has been established on an independent basis, the German university having commenced its separate career in the winter session of 1882–83. The German foundation retains its endowments, but the state subvention is divided between the two.

The repudiation on the part of the Protestant universities of both papal and episcopal authority evoked a counter-demonstration among those centres which still adhered to Catholicism, while their theological intolerance gave rise to a great reaction, under the influence of which the mediæval Catholic universities were reinvigorated and reorganized (although strictly on the traditional lines), while new and important centres were created. It was on the tide of this reaction, aided by their own skill and sagacity, that the Jesuits were borne to that commanding position which made them for a time the arbiters of education in Europe.

Bamberg.

The earliest university whose charter represented this reaction was that of Bamberg, founded by the prince-bishop Melchior Otto, after whom it was named "Academia Ottoniana." It was opened 1st September, 1648, and received both from the emperor Frederick III. and Pope Innocent X. all the civil and ecclesiastical privileges of a mediæval foundation. At first, however, it comprised only the faculties of arts and of theology;

to these was added in 1729 that of jurisprudence, and in 1764 that of medicine. In this latter faculty Dr. Ignatius Döllinger (the father of the historian) was for a long time a distinguished professor. The university of Innsbruck was founded in 1672 by the emperor Leopold I., from whom it received its name of "Academia Leopoldina." In the following century, under the patronage of the empress Maria Theresa, it made considerable progress, and received from her its ancient library and bookshelves in 1745. In 1782 the university underwent a somewhat singular change, being reduced by the emperor Joseph II. from the status of a university to that of a lyceum, although retaining in the theological faculty the right of conferring degrees. In 1791 it was restored to its privileges by the emperor Leopold II., and since that time the faculties of philosophy, law, and medicine have been represented in nearly equal proportions. In 1886 the number of professors was 74, and of students 869. The foundation of the university of Breslau was contemplated as early as the year 1505, when Ladislaus, king of Hungary, gave his sanction to the project, but Pope Julius II., in the assumed interests of Cracow, withheld his assent. Nearly two centuries later, in 1702, under singularly altered conditions, the Jesuits prevailed upon the emperor Leopold I. to found a university without soliciting the papal sanction. When Frederick the Great conquered Silesia in 1741, he took both the university and the Jesuits in Breslau under his protection, and when in 1774 the order was suppressed by Clement XIV. he established them as priests in the Royal Scholastic Institute, at the same time giving new statutes to the university. In 1811 the university was considerably augmented by the incorporation of that at Frankfort-on-the-Oder. At the present time it possesses both a Catholic and a Lutheran faculty. Its medical faculty is in high repute. The total number of students in 1887 was 1347.

Breslau.

The Jesuits in the university.

In no country was the influence of the Jesuits on the universities more marked than in France. The civil wars in that country during the thirty years which preceded the close of the 16th century told with disastrous effects upon the condition of the university of Paris, and with the commencement of the 17th century its collegiate life seemed at an end, and its forty colleges stood absolutely deserted. To this state of affairs the obstinate conservatism of the academic authorities not a little contributed. The statutes by which the university was still governed were those which had been given by the cardinal D'Estouteville, the papal legate, in 1452, and remained entirely unmodified by the influences of the Renaissance. In 1579 the edict of Blois promulgated a scheme of organization for all the universities of the realm (at that time twenty-one in number),—a measure which, though productive of unity of teaching, did nothing towards the advancement of the studies themselves. The eminent lawyers of France, unable to find chairs in Paris, distributed themselves among the chief towns of the provinces. The Jesuits did not fail to profit by this immobility and excessive conservatism on the part of the university, and during the second half of the 16th century and the whole of the 17th they had contrived to gain almost a complete monopoly of both the higher and the lower education of provincial France. Their schools arose at Toulouse and Bordeaux, at Auch, Agen, Rhodez, Périgueux, Limoges, Le Puy, Aubenas, Béziers, Tournon, in the colleges of Flanders and Lorraine, Douai and Pont-à-Mousson,—places beyond the jurisdiction of the parlement of Paris or even of the crown of France. Their banishment from Paris itself had been by the decree of the parlement alone, and had never been confirmed by the crown. "Lyons," says Pattison, "loudly demanded a Jesuit college, and even the Huguenot Lesdiguières, almost king in Dauphiné, was preparing to erect one at Grenoble. Amiens, Rheims, Rouen, Dijon, and Bourges were only waiting a favorable opportunity to introduce the Jesuits within their walls."[1] The university was rescued from the fate which seemed to threaten it only by the excellent statutes given by Richer in 1598, and by the discerning protection extended to it by Henry IV.

Condition of the university of Paris.

Colleges of the Jesuits in France.

The "college of Edinburgh" was founded by charter of James VI., dated 14th April, 1582. This document contains no reference to a studium generale, nor is there ground for supposing that the foundation of a university was at that time contemplated. In marked contrast to the three older centres in Scotland, the college rose comparatively untrammelled by the traditions of mediævalism, and its creation was not effected without some jealousy and opposition on the part of its predecessors. Its first course of instruction was commenced in the Kirk of Field, under the direction of Robert Rollock, who had been educated at St. Andrews under Andrew Melville, the eminent Covenanter. "He began to teach," says Craufurd, "in the lower hall of the great lodging, there being a great concourse of students allured with the great worth of the man; but diverse of them being not ripe enough in the Latin tongue, were in November next put under the charge of Mr. Duncan Narne, . . . who, upon Mr. Rollock's recommendation, was chosen second master of the college."[2] In 1585 both Rollock and Nairne subscribed the National Covenant, and a like subscription was from that time required from all who were admitted to degrees in the college.

Edinburgh.

Disastrous as were the effects of the Thirty Years' War upon the external condition of the German universities, resulting in not a few instances in the total dispersion of the students and the burning of the buildings and libraries, they were less detrimental and less permanent than those which were discernible in the tone and temper of these communities. A formal pedantry and unintelligent method of study, combined with a passionate dogmatism in matters of religious belief, and a rude contempt for the amenities of social intercourse, became the leading characteristics, and lasted throughout the 17th century. But in the year 1693 the foundation of the university of Halle opened up a career to two very eminent men, whose influence, widely different as was its character, may be compared for its effects with that of Luther and Melanchthon, and served to modify the whole current of German philosophy and German theology. Halle has indeed been described as "the first real modern university." It was really indebted for its origin to a spirit of rivalry between the conservatism of Saxony and the progressive tendencies of the house of Brandenburg, but the occasion of its rise was the removal of the ducal court from Halle to Magdeburg. The archbishopric of the latter city having passed into the possession of Brandenburg in 1680 was changed into a dukedom, and the city itself was selected as the ducal residence. This change left unoccupied some commodious buildings in Halle, which it was decided to utilize for purposes of education. A "Ritterschule" for the sons of the nobility was opened, and in the course of a few years it was decided to found a university. Saxony endeavored to thwart the scheme, urging the proximity of Leipsic; but her opposition was overruled by the emperor Leopold I., who granted (19th October, 1693) the requisite charter, and in the following year the work of the university commenced. Frankfort-on-the-Oder had by this time become a centre of the Reformed party, and the primary object in founding a university in Halle was to create a centre for the Lutheran party, but its character, under the influence of its two most notable teachers, Christian Thomasius and A. H. Francke, soon expanded beyond

the limits of this conception to assume a highly original form. Thomasius and Francke had both been driven from Leipsic owing to the disfavor with which their liberal and progressive tendencies were there regarded by the academic authorities, and on many points the two teachers were in agreement. They both regarded with contempt alike the scholastic philosophy and the scholastic theology; they both desired to see the rule of the civil power superseding that of the ecclesiastical power in the seats of learning; they were both opposed to the ascendency of classical studies as expounded by the humanists—Francke regarding the Greek and Roman pagan writers with the old traditional dislike, as immoral, while Thomasius looked upon them with contempt, as antiquated and representing only a standpoint which had been long left behind; both again agreed as to the desirability of including the elements of modern culture in the education of the young. But here their agreement ceased. It was the aim of Thomasius, as far as possible, to secularize education, and to introduce among his countrymen French habits and French modes of thought; his own attire was gay and fashionable, and he was in the habit of taking his seat in the professorial chair adorned with gold chain and rings, and with his dagger by his side. Francke, who became the leader of the Pietists, regarded all this with even greater aversion than he did the lifeless orthodoxy traditional in the universities, and was shocked at the worldly tone and disregard for sacred things which characterized his brother professor. Both, however, commanded a considerable following among the students. Thomasius was professor in the faculty of jurisprudence, Francke in that of theology. And it was a common prediction in those days with respect to a student who proposed to pursue his academic career at Halle, that he would infallibly become either an atheist or a Pietist. But the services rendered by Thomasius to learning were genuine and lasting. He was the first to set the example, soon after followed by all the universities of Germany, of lecturing in the vernacular instead of in the customary Latin; and the discourse in which he first departed from the traditional method was devoted to the consideration of how far the German nation might with advantage imitate the French in matters of social life and intercourse. His more general views, as a disciple of the Cartesian philosophy and founder of the modern Rationalismus, exposed him to incessant attacks; but by the establishment of a monthly journal (at that time an original idea) he obtained a channel for expounding his views and refuting his antagonists which gave him a great advantage. On the influence of Francke, as the founder of that Pietistic school with which the reputation of Halle afterwards became especially identified, it is unnecessary here to dilate.[1] J. C. Wolf, who followed Thomasius as an assertor of the new culture, was driven from Halle by the accusations of the Pietists, who declared that his teachings were fraught with atheistical principles. In 1740, however, he was recalled by Frederick II., and reinstated in high office with every mark of consideration and respect. Throughout the whole of the 18th century Halle was the leader of academic thought and culture in Protestant Germany, although sharing that leadership, after the middle of the century, with Göttingen. The university of Göttingen (named after its founder "Georgia Augusta") was endowed with the amplest privileges as a university by George II. of England, elector of Hanover, 7th December, 1736. The imperial sanction of the scheme had been given three years before (13th January, 1733), and the university was formally opened 17th September, 1737. The king himself assumed the office of "rector magnificentissimus," and the liberality of the royal endowments (doubling those of Halle), and the not less liberal character of the spirit that pervaded its organization, soon raised it to a foremost place among the schools of Germany. Halle had just expelled Wolf; and Göttingen, modelled on the same lines as Halle, but rejecting its Pietism and disclaiming its intolerance, appealed with remarkable success to the most enlightened feeling of the time. It included all the faculties, and two of its first professors—Mosheim, the eminent theologian, from Helmstädt, and Böhmer, the no less distinguished jurist, from Halle—together with Gesner, the man of letters, at once established its reputation. Much of its early success was also due to the supervision of its chief curator (there were two)—Baron Münchausen, himself a man of considerable attainments, who by his sagacious superintendence did much to promote the general efficiency of the whole professoriate. Not least among its attractions was also its splendid library, located in an ancient monastery, and now containing over 200,000 volumes and 5000 MSS. In addition to its general influence as a distinguished seat of learning, Göttingen may claim to have been mainly instrumental in diffusing a more adequate conception of the importance of the study of history. Before the latter half of the 18th century the mode of treatment adopted by university lecturers was singularly wanting in breadth of view. Profane history was held of but little account, excepting so far as it served to illustrate ecclesiastical and sacred history, while this, again, was invariably treated in the narrow spirit of the polemic, intent mainly on the defence of his own confession, according as he represented the Lutheran or the Reformed Church. The labors of the professors at Göttingen, especially Putter, Gatterer, Schlözer, and Spittler, combined with those of Mascov at Leipsic, did much towards promoting both a more catholic treatment and a wider scope. Not less beneficial was the example set at Göttingen of securing the appointment of its professors by a less prejudiced and partial body than a university board is only too likely to become. "'The great Münchausen,' says an illustrious professor of that seminary, 'allowed our university the right of presentation, of designation, or of recommendation, as little as the right of free election; for he was taught by experience that, although the faculties of universities may know the individuals best qualified to supply their vacant chairs, *they are seldom or never disposed to propose for appointment the worthiest within their knowledge.*'"[2] The system of patronage adopted at Göttingen was, in fact, identical with that which had already been instituted in the universities of the Netherlands by Douza (see *infra*, p. 906). The university of Erlangen, a Lutheran centre, was founded by Frederick, margrave of Baireuth. Its charter was granted by the emperor Charles VII., 21st February, 1743, and the university was formally constituted, 4th November. From its special guardian, Alexander, the last margrave of Ansbach, it was styled "Academia Alexandrina." In 1791, Ansbach and Baireuth having passed into the possession of Prussia, Erlangen became subject to the Prussian Government. The number of the students, which at the commencement of the century was under 300, was 880 in 1887.

Influence of Thomasius and Francke.

Göttingen.

Erlangen.

On comparison with the great English universities, the universities of Germany must be pronounced inferior both in point of discipline and of moral control over the students. The superiority of the former in these respects is partly to be attributed to the more systematic care which they took, from a very early date, for the supervision of each student, by requiring that within a certain specified time after his entry into the university he should be registered as a pupil of some master of arts, who was responsible for his conduct, and represented him generally in his relations to the

The English and German universities compared.

[2] Hamilton, *Discussions*, p. 381.

academic authorities. Marburg in its earliest statutes (those of 1529) endeavored to establish a similar rule, but without success.[1] The development of the collegiate system at Oxford and Cambridge materially assisted the carrying out of this discipline. Although again, as in the German universities, feuds were not unfrequent, especially those between "north" and "south" (the natives of the northern and southern counties), the fact that in elections to fellowships and scholarships only a certain proportion were allowed to be taken from either of these divisions acted as a considerable check upon the possibility of any one college representing either element exclusively. In the German universities, on the other hand, the ancient division into nations, which died out with the 15th century, was revived under another form by the institution of national colleges, which largely served to foster the spirit of rivalry and contention. The demoralization induced by the Thirty Years' War and the increase of duelling intensified these tendencies, which, together with the tyranny of the older over the younger students, known as "Pennalismus," were evils against which the authorities contended, but ineffectually, by various ordinances. The institution of "Burschenthum," having for its design the encouragement of good fellowship and social feeling irrespective of nationality, served only as a partial check upon these excesses, which again received fresh stimulus by the rival institution of "Landsmannschaften," or societies of the same nationality. The latter proved singularly provocative of duelling, while the arrogant and even tyrannical demeanor of their members towards the unassociated students gave rise to a general combination of the latter for the purposes of self-defence and organized resistance. At all the great German universities both these forms of association are to be found existing at the present day.

Extinction of German universities during 1798–1815.

The political storms which marked the close of the last and the commencement of the present century gave the death-blow to not a few of the ancient universities of Germany. Mainz and Cologne ceased to exist in 1798; Bamberg, Dillingen, and Duisberg in 1804; Rinteln and Helmstädt in 1809; Salzburg in 1810; Erfurt in 1816. Altdorf was united to Erlangen in 1807, Frankfort-on-the-Oder to Breslau in 1809, and Wittenberg to Halle in 1815. The university of Ingolstadt was first moved in 1802 to Landshut, and from thence in 1826 to Munich, where it was united to the academy of sciences which was founded in the Bavarian capital in 1759. Of those of the above centres which altogether ceased to exist but few, however, were much missed or regretted,—that at Mainz, which had numbered some six hundred students, being the one notable exception. The others had for the most part fallen into a perfunctory and lifeless mode of teaching, and, with wasted or diminished revenues and declining numbers, had long ceased worthily to represent the functions of a university. Whatever loss may have attended their suppression has been far more than compensated by the activity and influence of the three great German universities which have risen in the present century. Munich has become a distinguished centre of study in all the faculties; and its numbers, allowing for the two great wars, have been continuously on the increase. The number of its professors in 1887 was over ninety, and that of its students at the commencement of the session 1886–87 3209.

Munich.

The university of Berlin, known as the Royal Friedrich Wilhelm university, was founded in 1809, immediately after the peace of Tilsit, when Prussia had been reduced to the level of a third-rate power. Under the guiding influence of Wilhelm von Humboldt, however, the principles which were adopted in connection with the new seat of learning not only raised it to a foremost place among the universities of Europe, but also largely conduced to the regeneration of Germany. A notable characteristic in the university of Berlin at the time of its foundation was its entire repudiation of attachment to any particular creed or school of thought, and professed subservience only to the interests of science and learning. "Each of the eminent teachers with whom the university began its life—F. A. Wolf, Fichte, Savigny, Reil—represented only himself, the path of inquiry or the completed theory which he had himself propounded. Its subsequent growth was astonishing. In 1813 Berlin had only 36 teachers altogether; in 1860 there were 173 in all,—97 professors, 66 privatdocenten, and 7 lecturers." In 1886 there were 296 teachers and 5357 students; and among the former a large proportion of the names are already of world-wide reputation, while its classical school stands unrivalled in Europe.

Berlin.

The university of Bonn, founded in 1818, and known as the Rhenish Friedrich Wilhelm university, has 88 professors and 1125 students. Equally distinguished as a school of philosophy and a school of theology, it is notable for the manner in which it combines the opposed schools of theological doctrine,—that of the Evangelical (or Lutheran) Church and that of the Roman Catholic Church here standing side by side, and both adorned by eminent names. This combination (which also exists at Tübingen and at Breslau) has been attended with complete success and (according to Dr. Döllinger) with unmistakable advantages. When tried, however, a generation before, at Erfurt and at Heidelberg, its failure was not less conspicuous, and Erfurt was ruined by the experiment.

Bonn.

Statistics of German and British universities compared.

Dr. Conrad, professor of political science at Halle, has recently made the statistics relating to the German universities the subject of a careful investigation and analysis which offer some interesting results. The total cost of the universities of the German empire is shown to be much smaller than the total revenues of the English universities and colleges, although the number both of professors and students is much larger, and although 42 per cent. of the total expenditure is upon establishments, such as hospitals, museums, and so forth. But in Germany 72 per cent. of the cost of the universities is defrayed by the state, the students paying, in the shape of fees, only 9.3 per cent. To a great extent, however, the German universities are to be looked upon as professional schools, giving an education which directly fits a man to earn his bread as a clergyman, a lawyer, a judge, a physician, a schoolmaster, a chemist, an engineer, or an agriculturist. Notwithstanding the rapid growth in the numbers of the students, the growth of the professoriate has fully kept pace with it. In 1880 there were 1809 teachers at work in the German universities, more than half of whom (967) were full professors ("ordinarii"),—the proportion of teachers to students being 1 to 11. This is a much higher proportion than that of Oxford and Cambridge, although in them there is a large staff of college lecturers, which is practically more important than the university staff. It is higher again than the proportion of the Scottish universities, where there are only some 105 professors to between 5000 and 6000 students, a proportion of 1 to between 50 and 60 students. The increase in Germany has taken place partly by adding on fresh teachers for the old subjects, such as Latin and Greek, but still more by founding new chairs for new subjects, such as Oriental and Romance languages, geography, and

[1] "Volumus neminem in hanc nostram Academiam admitti, aut per rectorem in album recipi, qui non habeat privatum atque domesticum præceptorem, qui ejus discipulum agnoscat, ad cujus judicium quisque pro sua ingenii capacitate atque Marte lecturas et publicas et privatas audiat, a cujus latere aut raro aut nunquam discedat." Koch expressly compares this provision with the discipline of Oxford and Cambridge, which, down to the commencement of the present century, was very much of the same character (Koch. *Gesch. des academischen Pädagogiums in Marburg*, p. 11).

archæology, and by subdividing departments which have been recently developed, such as those connected with political economy, political science, physiology, and biology. Owing to the great development of natural science, the faculty of philosophy has at some centres increased to such an extent as to equal in numbers all the other faculties put together. This inconvenience has been differently met at different universities. In those of Switzerland, no further remedy has been devised than that of appointing separate syndicates or boards of management for the two main divisions,—the philosophico-historic and the mathematical and natural-scientific; at Dorpat, Tübingen, and Strasburg, on the other hand, these divisions have been represented by the formation of two distinct faculties; while Tübingen, Munich, and Würzburg have created, in addition, a third faculty under which are grouped the several subjects of political economy, statistics, and finance.

Averages of students at German universities.

Table II. (taken from Conrad) exhibits the average of the total number of matriculated students at the German universities for every five years from 1831 to 1884; it brings the tendency to form large centres very forcibly before the view. The three largest centres—Berlin, Leipsic, Munich—even in the first quinquennium appear as absorbing no less than 35 per cent. of the students, and in the last as many as 42 per cent. At the same time, there has lately been a no less notable increase among the centres of second magnitude. A quarter of a century ago only two universities had more than a thousand students; at present there are nine.

Table of professors and students.

Table III., taken from Ascherson's *Deutscher Universitäts-Kalender*, 1887, supplies the most recent statistics respecting both the teaching and the student bodies in the different faculties of the German-speaking universities on the Continent.

In 1878 a comparison of the numbers of the students in the different faculties in the Prussian universities with those for the year 1867 showed a remarkable diminution in the faculty of theology, amounting in Lutheran centres to more than one-half, and in Catholic centres to nearly three-fourths. In jurisprudence there was an increase of nearly two-fifths, in medicine a decline of a third, and in philosophy an increase of one-fourth. During the last few years, however, the faculties of theology have made some progress towards regaining their former numbers.

Fluctuations of numbers.

The universities of the United Provinces, like those of Protestant Germany, were founded by the state as schools for the maintenance of the principles of the Reformation and the education of the clergy, and afforded in the 16th and 17th centuries a grateful refuge to not a few

of those Huguenot or Port-Royalist scholars whom persecution compelled to flee beyond the boundaries of France, as well as to the Puritan clergy who were driven from England. The earliest, that of Leyden, founded in 1575, commemorated the gallant and successful resistance of the citizens to the Spanish fleet under Requesens. Throughout the 17th century Leyden was distinguished by its learning, the ability of its professors, and the shelter it afforded to the more liberal thought associated at that period with Arminianism. Much of its early success was owing to the wise provisions and the influence of the celebrated Janus Douza: "Douza's principles," says Hamilton, "were those which ought to regulate the practice of all academical patrons; and they were those of his successors. He knew that at the rate learning was seen prized by the state in the academy would it be valued by the nation at large. . . . . He knew that professors wrought more even by example and influence than by teaching, that it was theirs to pitch high or low the standard of learning in a country, and that, as it proved easy or arduous to come up with them, they awoke either a restless endeavor after an even loftier attainment, or lulled into a self-satisfied conceit." Douza was, for Leyden and the Dutch, what Münchausen afterwards was for Göttingen and the German universities. "But with this difference: Leyden was the model on which the younger universities of the republic were constructed; Göttingen the model on which the older universities of the empire were reformed. Both Münchausen and Douza proposed a high ideal for the schools founded under their auspices; and both, as first curators, labored with paramount influence in realizing this ideal for the same long period of thirty-two years. Under their patronage Leyden and Göttingen took the highest place among the universities of Europe; and both have only lost their relative supremacy by the application in other seminaries of the same measures which had at first determined their superiority." The appointment of the professors at Leyden was vested in three (afterwards five) curators, one of whom was selected from the body of the nobles, while the other two were appointed by the states of the province,—the office being held for nine years, and eventually for life. With these was associated the mayor of Leyden for the time being. The university of Francker was founded in 1585 on a somewhat less liberal basis than Leyden, the professors being required to declare their assent to the rule of faith embodied in the Heidelberg Catechism and the confession of the "Belgian Church." Its four faculties were those of theology, jurisprudence, medicine, and "the three languages and the liberal arts."[1] For a period of twelve years (*circ.* 1610–1622) the reputation of the university was enhanced by the able teaching of William Ames ("Amesius"), a Puritan divine and moralist who had been driven by Bancroft from Cambridge and from England. His fame and ability are said to have attracted to Franeker students from Hungary, Poland, and Russia.

Leyden.

Franeker.

With like organization were founded—in 1600 the university of Harderwijk, in 1614 that of Groningen, and in 1634 that of Utrecht. The restoration of the House of Orange, and establishment of the kingdom of the Netherlands (23d March, 1815), was followed by important changes in connection with the whole kingdom. The universities of Franeker and Harderwijk were suppressed, while their place was taken by the newly-founded centres at Ghent (1816) and Liége (1816). A uniform constitution was given both to the Dutch and Belgian universities. It was also provided that there should be attached to each a board of curators, consisting of five persons, "distinguished by their love of literature and science and by their rank in society." These curators were to be nominated by the king, and at least three of them chosen from the province in which the university was situated, while the other two were to be chosen from adjacent provinces. After the redivision of the kingdom in 1831, Ghent and Liége were constituted state universities, and each received a subsidy from the Government (see BELGIUM). The university of Brussels, on the other hand, founded in 1834, is an independent institution, supported by the liberal party; while the reconstituted university at Louvain represents the party of Roman Catholicism, and is almost exclusively a theological school for the education of the Catholic clergy. The universities of Belgium are, however, somewhat heterogeneous bodies, and present in their organization a singular combination of French and German institutions. In Holland, the foundation of the university of Amsterdam (1877) has more than repaired the loss of Franeker and Harderwijk, and the progress of this new centre during the ten years of its existence has been remarkably rapid, so that it bids fair to rival, if not to outstrip, both Utrecht and Leyden. The higher education of women has made some progress in the Netherlands; and in 1882–83 there were eighteen women studying at Amsterdam, eleven at Groningen, four at Leyden, and seven at Utrecht.

In Sweden the university of Lund, founded in 1668 and modelled on the same plan as its predecessor at Upsala, has adhered to its antiquated constitution with remarkable tenacity. At both these universities the mediæval division into "nations" is still in force among the students, the number at Upsala being no less than thirteen. The professoriate at both centres is much below the modern requirements in point of numbers. The university of Christiania in Norway, founded in 1811, and the Swedish universities are strongly Lutheran in character; and all alike are closely associated with the ecclesiastical institutions of the Scandinavian kingdoms. The same observation applies to Copenhagen,—where, however, the labors of Rask and Madvig have done much to sustain the reputation of the university for learning. The university of Kiel (1665), on the other hand, has come much more under Teutonic influences, and is now a distinguished centre of scientific teaching.

In France the fortunes of academic learning were even less happy than in Germany. The university of Paris was distracted throughout the 17th century, by theological dissensions,—in the first instance owing to the struggle that ensued after the Jesuits had effected a footing at the Collége de Clermont, and subsequently by the strife occasioned by the teaching of the Jansenists. Its studies, discipline, and numbers alike suffered. Towards the close of the century a certain revival took place, and a succession of illustrious names—Pourchot, Rollin, Grenan, Coffin, Demontempuys, Crevier, Lebeau—appear on the roll of its teachers. But this improvement was soon interrupted by the controversies excited by the promulgation of the bull Unigenitus in 1713, condemning the tenets of Quesnel, when Rollin himself, although a man of singularly pacific disposition, deemed it his duty to head the opposition to Clement XI. and the French episcopate. At last, in 1762, the parlement of Paris issued a decree (August 6) placing the colleges of the Jesuits at the disposal of the university, and this was immediately followed by another for the expulsion of the order from Paris. Concurrently with this measure the prospects of the university assumed a more favorable character, the curriculum of its studies was extended, and both history and natural science began to be cultivated with a certain success. These better

University of Paris from the 17th century.

[1] *Statuta et Leges*, Franeker, 1647, p. 3.

prospects were, however, soon obscured by the outbreak of the Revolution; and on the 15th September, 1793, the universities and colleges throughout France, together with the faculties of theology, medicine, jurisprudence, and arts, were abolished by a decree of the Convention. The Collége de France, when restored in 1831, was reconstituted mainly as a school of adult instruction, for the most part of a popular character, and entirely dissociated from the university. It now numbers thirty-nine chairs, among which is one of the Slavonic languages and literature. The university of France (which succeeded to that of Paris) is at present little more than an abstract term, signifying the whole of the professional body under state control, and comprising various faculties at different centres—Paris, Montpellier, Nancy, etc., together with twenty-seven academical rectorates. Each of these rectors presides over a local "conseil d'enseignement," in conjunction with which he elects the professors of lycées and the communal schoolmasters, whose formal appointment is then made by the minister of public instruction. There are ecclesiastics in some of the conseils d'enseignement, but the rectors are all laymen who have graduated in one of the faculties. The great schools have also in no small measure supplemented the work of the universities by their advance in the direction of scientific instruction. Among the number the "Ecole Pratique des Hautes Etudes" in Paris (31st July, 1868) and the "Ecole Polytechnique," which traces its origin as far back as the year 1794, are especially distinguished. The course of instruction at the former is divided into five sections—(1) mathematics, (2) physics and chemistry, (3) natural history and physiology, (2) history and philology, (5) economic science. At the latter the instruction is conceived solely with regard to the application of scientific principles to all branches of the public service, but more especially the military and mercantile. In 1875 the National Assembly passed an Act which enabled the Roman Catholic body to establish free universities of their own, and to confer degrees which should be of the same validity as those of the state university. At Lille and Angers such centres have been already organized. The university of Strasburg, which in the latter part of the last century had been distinguished by an intellectual activity which became associated with the names of Goethe, Herder, and others, was also swept away by the Revolution. It was, however, restored 1st May, 1872, after the city had reverted to Germany, and was remodelled entirely on German principles. Since then its success has been marked and continuous.

Universities suppressed throughout France.

In Switzerland all the higher education is supported mainly by the German and Protestant cantons. The four universities of Basel, Bern, Zurich, and Geneva have an aggregate of some 1400 or 1500 students, and all possess faculties of philosophy, jurisprudence, theology, and medicine. Basel is, however, the chief centre for theology, as is Bern for jurisprudence, and Zurich for philosophy. At Geneva the famous academy of the 16th and 17th centuries, long distinguished as a centre of Calvinistic teaching, is now represented by a university (first formed in 1876), where the instruction is given (mainly in the French language) by a staff of forty-one professors, and where there is a rising school of science. Switzerland almost takes the lead in connection with female education on the Continent, and in 1882–83 there were 52 women at the university of Geneva, 36 at Bern, and 24 at Zurich.

Geneva.

In Spain the universities at present existing are those of Barcelona, Granada, Madrid (transferred in 1837 from Alcalá), Oviedo, Salamanca, Santiago, Seville, Valencia, Valladolid, and Zaragoza. They are all, with the exception perhaps of Madrid, in a lamentably depressed condition, and mainly under the influence of French ideas and modelled on French examples. But in Portugal, Coimbra, which narrowly escaped suppression in the 16th century as a suspected centre of political disaffection, is now a flourishing school. Its instruction is given gratis; but, as all members of the higher courts of judicature and administration in the realm are required to have graduated at the university, it is at the same time one of the most aristocratic schools in Europe. There are five faculties, viz., theology, jurisprudence, medicine, mathematics, and philosophy. Of these, that of law is by far the most flourishing, the number of students in this faculty nearly equalling the aggregate of all the rest. There is a valuable library, largely composed of collections formerly belonging to suppressed convents. As a school of theology Coimbra is distinctly anti-ultramontane, and the progressive spirit of the university is shown by the fact that the rector has been instructed by the government to devise a scheme for the admission of women.

Universities of Spain and Portugal,

In Italy the universities are numerically much in excess of the requirements of the population, there being no less than sixteen state universities and four free universities. Very few of these possess theological faculties, and in no country are theological studies less valued. Education for the church is almost entirely given at the numerous "seminaries," where it is of an almost entirely elementary character. In 1875 a laudable effort was made by Bonghi, the minister of education, to introduce reforms and to assimilate the universities in their organization and methods to the German type. His plans were, however, to a great extent reversed by his successor, Coppino.

of Italy,

In Austria the universities, being modelled on the same system as that of Prussia, present no especially noteworthy features. Vienna is chiefly distinguished for its school of medicine, which enjoyed in the last century a reputation almost unrivalled in Europe. The other faculties were, however, suffered to languish, and throughout the first half of the present century the whole university was in an extremely depressed state. From this condition it was in a great measure restored by the exertions of Count Thun. The number of the matriculated students in 1887 was 4893, and that of the professors 138; among the latter the names of Zschokke, Maassen, Sickel, Jellinek, and Büdinger are some of the most widely known. The university of Olmütz, founded in 1581, was formerly in possession of what is now the imperial library, and contained also a valuable collection of Slavonic works which were carried off by the Swedes and ultimately dispersed. It was suppressed in 1853, and is now represented only by a theological faculty. The university of Graz, the capital of Styria, was founded in 1586, and is now one of the most flourishing centres, containing some 1200 students. The university of Salzburg, founded in 1623, was suppressed in 1810; that of Lemberg, founded in 1784 by the emperor Joseph II., was removed in 1805 to Cracow and united to that university. In 1816 it was opened on an independent basis. In the bombardment of the town in 1848 the university buildings were burned down, and the site was changed to what was formerly a Jesuit convent. The fine library and natural history museum were at the same time almost entirely destroyed. The university at the present time numbers over a thousand students. The most recent foundation is that of Czernowitz, founded in 1875, and numbering about 300 students. The universities of the Hungarian kingdom are

three in number: Budapest, originally founded at Tyrnau in 1635, now possessing four faculties — theology, jurisprudence, medicine, and philosophy (number of professors in 1885 180, students 3117); Kolozsvar (Klausenburg), now the chief Magyar centre, founded in 1872 and also comprising four faculties, but where mathematics and natural science supply the place of theology (number of professors in 1877 64, students 391); Zágráb (Agram), the Slovene university, in Croatia, founded in 1869 but not opened until 1874, with three faculties, viz., jurisprudence, theology, and philosophy. The chief centre of Protestant education is the college at Debreczin, founded in 1531, which in past times was not unfrequently subsidized from England. It now numbers over 2000 students, and possesses a fine library.

Budapest. Klausenburg. Agram. Debreczin.

Russia possesses, besides Dorpat (*supra*, p. 901), seven other universities. (1) Helsingfors, in Finland, was originally established by Queen Christina in Åbo (1640), and removed in 1826 to Helsingfors, where the original charter, signed by the celebrated Oxenstierna, is still preserved. It has four faculties, 38 professors, and 700 students. (2) Moscow is really the oldest Russian university, having been founded in 1755; it includes the faculties of history, physics, jurisprudence, and medicine; the professors are 69 in number, the students about 1660. (3) The university of St. Vladimir at Kieff, originally founded at Vilna in 1803, was removed from thence to Kieff in 1833; the students number about 900, and the library contains 107,000 volumes. (4) Kazan (1804) includes the same faculties as Moscow; the students are about 450 in number, and it has a library containing 80,000 volumes. (5) Kharkoff (1804) numbers 600 students, and its library 55,000 volumes. (6) St. Petersburg (1819) includes the four faculties of history, physics, jurisprudence, and Oriental languages, and numbers 1500 students. (7) Odessa, founded in 1865, represents the university of New Russia. Generally speaking the universities of Russia are not frequented by the aristocratic classes; they are largely subsidized by the Government, and the annual fees payable by students are less than £7 a head. In 1863 the statutes of all the universities were remodelled; and since that time there has been a tendency to impress upon them a more national character, as distinguished from mere imitation of those in Germany.

Russian universities. Helsingfors. Moscow. Kieff. Kazan. Kharkoff. St. Petersburg. Odessa.

The university of Athens (founded 22d May, 1837) is modelled on the university systems of northern Germany, on a plan originally devised by Professor Brandis. It includes four faculties, viz., theology, jurisprudence, medicine, and philosophy. The professors (ordinary and extraordinary) are upwards of 60 in number, the students about 1500. There is also a school of pharmacy, chemistry, and anatomy, and a library of 130,000 volumes, with 800 manuscripts.

Athens.

The history of the two English universities during the 16th and following centuries has presented, for the most part, features which contrast strongly with those of the Continental seats of learning. Both suffered severely from confiscation of their lands and revenues during the period of the Reformation, but otherwise have generally enjoyed a remarkable immunity from the worst consequences of civil and political strife and actual warfare. Both long remained centres chiefly of theological teaching, but their intimate connection at once with the state and with the Church of England, as "by law established," and the modifications introduced into their constitutions, prevented their becoming arenas of fierce polemical contentions like those which distracted the Protestant universities of Germany.

The English universities since the mediæval period.

The influence of the Renaissance, and the teaching of Erasmus, who resided for some time at both universities, exercised a notable effect alike at Oxford and at Cambridge. The names of Colet, Grocyn, and Linacre illustrate this influence at the former centre; those of Bishop Fisher, Sir John Cheke, and Sir Thomas Smith at the latter. The labors of Erasmus at Cambridge as the author of a new Latin version of the New Testament, with the design of placing in the hands of students a text free from the errors of the Vulgate, were productive of important effects, and the university became a centre of Reformation doctrine some years before the writings of Luther became known in England. The foundation of Christ's College (1505) and St. John's College (1511), through the influence of Fisher with the countess of Richmond, also materially aided the general progress of learning at Cambridge. The Royal Injunctions of 1535, embodying the views and designs of Thomas Cromwell, mark the downfall of the old scholastic methods of study at both universities; and the foundation of Trinity College, Cambridge, in 1546 (partly by an amalgamation of two older societies), represents the earliest conception of such an institution in England in complete independence of Roman Catholic traditions. Trinity (1554) and St. John's (1555) at Oxford, on the other hand, founded during the reactionary reign of Mary, serve rather as examples of a transitional period.

Influence of the Renaissance. The Reformation at Cambridge.

In the reign of Elizabeth Cambridge became the centre of another great movement—that of the earlier Puritanism, St. John's and Queens' being the strongholds of the party led by Cartwright, Walter Travers, and others. Whitaker, the eminent master of St. John's, although he sympathized to some extent with these views, strove to keep their expression within limits compatible with conformity to the Church of England. But the movement continued to gather strength; and Emmanuel College, founded in 1584, owed much of its early prosperity to the fact that it was a known school of Puritan doctrine. Most of the Puritans objected to the discipline enforced by the university and ordinary college statutes—especially the wearing of the cap and the surplice and the conferring of degrees in divinity. The Anglican party, headed by such men as Whitgift and Bancroft, resorted in defence to a repressive policy, of which subscription to the Acts of Supremacy and uniformity, and the Elizabethan statutes of 1570 (investing the "caput" with larger powers, and thereby creating a more oligarchical form of government), were the most notable results. Oxford, although the Puritans were there headed by Leicester, the chancellor, devised at the same time a similar scheme, the rigid discipline of which was further developed in the Laudian or Caroline statutes of 1636. It was under these respective codes—the Elizabethan statutes of 1570 and the Laudian statutes of 1636—that the two universities were governed until the introduction of the new codes of 1858. During the Commonwealth the Puritan occupation and administration, at either university, were accompanied by little injury to the colleges, and were far less prejudicial to learning than the Royal writers of the Restoration would lead us to suppose. William Dell, who was master of Caius College from 1649 to 1660, advocated the formation of schools of higher instruction in the large towns, a proposal which was then looked upon as one of but faintly masked hostility to the older centres.

Puritanism at Cambridge. Elizabethan statutes of 1570. Laudian statutes of 1636.

During the 17th century Cambridge became the centre of another movement, a reflex of the influence

of the Cartesian philosophy, which attracted for a time considerable attention. Its leaders, known as the Cambridge Platonists, among whom Henry More, Cudworth, and Whichcote were especially conspicuous, were men of high character and great learning, although too much under the influence of an ill-restrained enthusiasm and purely speculative doctrines. The spread of the Baconian philosophy, and the example of a succession of eminent scientific thinkers, among whom were Isaac Barrow, master of Trinity (1673–77), the two Lucasian professors, Isaac Newton (prof. 1669–1702) and his successor William Whiston (prof. 1702–11), and Roger Cotes (Plumian prof. 1707–16), began to render the exact sciences more and more an object of study, and the institution of the tripos examinations in the course of the first half of the 18th century established the reputation of Cambridge as a school of mathematical science. At Oxford, where no similar development took place, and where the statutable requirements with respect to study and exercises were suffered to fall into neglect, the degeneracy of the whole community as a school of academic culture is attested by evidence too emphatic to be gainsaid. The moral tone at both universities was at this time singularly low; and the rise of Methodism, as associated with the names of the two Wesleys and Whitefield at Oxford and that of Berridge at Cambridge, operated with greater effect upon the nation at large than on either of the two centres where it had its origin. With the advance of the present century, however, a perceptible change took place. The labors of Simeon at Cambridge, in connection with the Evangelical party, and the far more celebrated movement known as Tractarianism, at Oxford, exercised considerable influence in developing a more thoughtful spirit at either university. At both centres, also, the range of studies was extended: written examinations took the place of the often merely formal *viva voce* ceremonies; at Cambridge classics were raised in 1824 to the dignity of a new tripos. The number of the students at both universities was largely augmented. Further schemes of improvement were put forward and discussed. And in 1850 it was decided by the Government to appoint commissioners to inquire what additional reforms might advantageously be introduced. Their recommendations were not all carried into effect, but the main results were as follows: "The professoriate was considerably increased, reorganized, and re-endowed, by means of contributions from colleges. The colleges were emancipated from their mediæval statutes, were invested with new constitutions, and acquired new legislative powers. The fellowships were almost universally thrown open to merit, and the effect of this was not merely to provide ample rewards for the highest academical attainments, but to place the governing power within colleges in the hands of able men, likely to promote further improvements. The number and value of scholarships was largely augmented, and many, though not all, of the restrictions upon them were abolished. The great mass of vexatious and obsolete oaths was swept away; and, though candidates for the M.A. degree and persons elected to fellowships were still required to make the old subscriptions and declarations, it was enacted that no religious test should be imposed at matriculation or on taking a bachelor's degree."

Methodism.

Simeonism.

Tractarianism.

Reforms of 1858.

In 1869 a statute was enacted at Cambridge admitting students as members of the university without making it imperative that they should be entered at any hall or college, but simply be residents either with their parents or in duly licensed lodgings.

Admission of non-collegiate students.

[1] Brodrick, *University of Oxford*, pp. 136, 137.

The entire abolition of tests followed next. After several rejections in parliament it was eventually carried as a Government measure, and passed the House of Lords in 1871.

Abolition of tests.

In 1877 the reports of two new commissions were followed by further changes, the chief features of which were the diversion of a certain proportion of the revenues of the colleges to the uses of the university, especially with a view to the encouragement of studies in natural science; the enforcement of general and uniform regulations with respect to the salaries, selection, and duties of professors, lecturers, and examiners; the abolition (with a few exceptions) of all clerical restrictions on headships or fellowships; and the limitation of fellowships to a uniform amount.

Reforms of 1877.

That these successive and fundamental changes have, on the whole, been in unison with the national wishes and requirements may fairly be inferred from the remarkable increase in numbers during the last quarter of a century, and especially at Cambridge, where the number of undergraduates, which in 1862 was 1526, was in 1887 no less than 2979. In the academic year 1862–63 the number of matriculations was 448, and in 1886–87, 1009.

Increase in numbers.

Scarcely less influential, as a means of recovering for the two universities a truly national character, has been the work which both have been carrying on and aiding by the institution of local examinations and of university extension lectures. Of these two schemes, the former was initiated by both Oxford and Cambridge, in the year 1858; the latter had its origin at Cambridge, having been suggested by the success attending a course of lectures to women delivered by Mr. (now Professor) James Stuart, in 1867, in Liverpool, Manchester, Sheffield, and Leeds. By the former the standard of education throughout the country has been raised, both in public and in private schools. By the latter, instruction of the character and method which characterize university teaching has been brought within the reach of students of all classes and ages throughout the land.

Local examinations and university extension lectures.

So long ago as the year 1640 an endeavor had been made to bring about the foundation of a northern university for the benefit of the counties remote from Oxford and Cambridge. Manchester and York both petitioned to be made the seat of the new centre. Cromwell, however, rejected both petitions, and decided in favor of Durham. Here he founded the university of Durham (1657), endowing it with the sequestered revenues of the dean and chapter of the cathedral, and entitling the society "The Mentor or Provost, Fellows, and Scholars of the College of Durham, of the foundation of Oliver, etc." This scheme was cancelled at the Restoration, and not revived until the present century; but on the 4th July, 1832, a bill for the foundation of a university at Durham received the royal assent, the dean and chapter being thereby empowered to appropriate an estate at South Shields for the establishment and maintenance of a university for the advancement of learning. The foundation was to be directly connected with the cathedral church, the bishop of the diocese being appointed visitor, and the dean and chapter governors; while the direct control was vested in a warden, a senate, and a convocation. A college, modelled on the plan of those at the older universities, and designated University College, Durham, was founded in 1837, Bishop Hatfield's Hall in 1846, and Bishop Cosin's Hall (which no longer exists) in 1851. The university includes all the faculties, and in 1865 there was added to the faculty of arts a school of physical science, including pure and applied mathematics, chemistry, geology, mining, engineering, etc. In 1871 the corporation of the university, in conjunction with

Durham.

some of the leading landed proprietors in the adjacent counties, gave further extension to this design by the foundation of a college of physical science at Newcastle-upon-Tyne, designed to teach scientific principles in their application to engineering, mining, manufactures, and agriculture. Students who had passed the required examinations were made admissible as associates in physical science of the university. There is also a medical college which stands in similar relations to Durham, of which university Codrington College, Barbados, and Fourah Bay College, Sierra Leone, are likewise affiliated colleges.

University of London.

The university of London had its origin in a movement initiated in the year 1825 by Thomas Campbell, the poet, in conjunction with Henry (afterwards Lord) Brougham, Mr. (afterwards Sir) Isaac Lyon Goldsmid, Joseph Hume, and some influential Dissenters, most of them connected with the congregation of Dr. Cox of Hackney. The scheme was originally suggested by the fact that Dissenters were practically excluded from the older universities; but the conception, as it took shape, was distinctly non-theological. The first council, appointed December, 1825, comprised names representative of nearly all the religious denominations, including (besides those above mentioned) Zachary Macaulay, George Grote, James Mill, William Tooke, Lord Dudley and Ward, Dr. Olinthus Gregory, Lord Lansdowne, Lord John Russell, and the duke of Norfolk. On 11th February, 1826, the deed of settlement was drawn up; and in the course of the year seven acres, constituting the site of University College, were purchased, the foundation stone of the new buildings being laid by the duke of Sussex 30th April, 1827. The course of instruction was designed to include "languages, mathematics, physics, the mental and the moral sciences, together with the laws of England, history, and political economy, and the various branches of knowledge which are the objects of medical education." In October, 1828, the college was opened as the university of London. But in the meantime a certain section of the supporters of the movement, while satisfied as to the essential soundness of the primary design as a development of national education, entertained considerable scruples as to the propriety of altogether dissociating such an institution from the national church. This feeling found expression in the foundation and incorporation of King's College (14th August, 1829), opened 8th October, 1831, and designed to combine with the original plan instruction in "the doctrines and duties of Christianity, as the same are inculcated by the United Church of England and Ireland." This new phase of the movement was so far successful that in 1836 it was deemed expedient to dissociate the university of London from University College as a "teaching body," and to limit its action simply to the institution of examinations and the conferring of degrees,—the college itself receiving a new charter, and being thenceforth designated as University College, London, while the rival institution was also incorporated with the university, and was thenceforth known as King's College, London. In the charter now given to the university it was stated that the king "deems it to be the duty of his royal office to hold forth to all classes and denominations of his faithful subjects, without any distinction whatsoever, an encouragement for pursuing a regular and liberal course of education." The charters of the university of London and of University College, London, were signed on the same day, 28th November, 1836. In 1869 both the colleges gave their adhesion to the movement for the higher education of women which had been initiated elsewhere, and in 1880 ladies were for the first time admitted to degrees.

King's College.

University College.

The Victoria University took its origin in the institution known as the Owens College, Manchester,—so called after a wealthy citizen of that name to whom it owed its foundation. The college was founded 12th March, 1851, for the purpose of affording to students who were unable, on the ground of expense, to resort to Oxford or Cambridge an education of an equally high class with that given at those centres. The institution was, from the first, unsectarian in character. In July, 1877, a memorial was presented to the privy council praying for the grant of a charter to the college, conferring on it the rank of a university, to be called the "university of Manchester." The localization implied in this title having met with opposition from the Yorkshire College at Leeds, it was resolved that the university should be called the "Victoria University." Under this name the foundation received its charter 20th April, 1880. "The characteristic features of the Victoria University, as compared with other British universities, are these: (*a*) it does not, like London, confer its degrees on candidates who have passed certain examinations only, but it also requires attendance on prescribed courses of academic study in a college of the university; (*b*) the constitution of the university contemplates its (ultimately) becoming a federation of colleges; but these colleges will not be situated, like those of Oxford and Cambridge, in one town, but wherever a college of adequate efficiency and stability shall have arisen. University College, Liverpool, and the Yorkshire College, Leeds, having fulfilled these requirements, have become affiliated with the university. The university, like the older bodies in England and Scotland, is at once a teaching and an examining body, and there is an intimate *rapport* between the teaching and the examining functions. To give it a general or national character, the governing body consists partly of persons nominated by the crown and partly of representatives of the governing and teaching bodies of the colleges and of the graduates of the university. External examiners are appointed, who conduct the examinations in conjunction with examiners representing the teaching body. The graduates of the university meet its teachers in convocation to discuss the affairs of the university. Convocation will elect future chancellors, and a certain number of representatives on the court" (Thompson, *The Owens College*, etc., p. 548). Like the Johns Hopkins University in America, the Victoria University has instituted certain fellowships (styled the Berkeley fellowships) for the encouragement of research.

Victoria.

In Scotland the chief change to be noted in connection with the university of St. Andrews is the appropriation in 1579 of the two colleges of St. Salvator and St. Leonard to the faculty of philosophy, and that of St. Mary to theology. In 1747 an Act of Parliament was obtained for the union of the two former colleges into one. Glasgow, in the year 1577, received a new charter, and its history from that date down to the Restoration was one of almost continuous progress. The restoration of Episcopacy, however, involved the alienation of a considerable portion of its revenues, and the consequent suspension of several of its chairs. In 1864 the old university buildings were sold, and, a Government grant having been obtained, together with private subscriptions, the present new buildings were erected from the joint fund. The faculties now recognized at Glasgow are those of arts, theology, jurisprudence, and medicine. At Aberdeen an amalgamation, similar to that at St. Andrews, took place, by virtue of the Universities Act of 1858, of the two universities of King's College and Marischal College. In conjunction with Glasgow, this university returns a member to parliament. The peculiar constitution of the college at Edinburgh, as defined by its charter (the government being vested entirely in the lord provost, magistrates, and council, as patrons and guardians), involved the senate in frequent collisions with the town council.

Changes in universities of St. Andrews, Glasgow, and Aberdeen.

Changes in university of Edinburgh.

The latter, being a strictly representative body, included elements with which the senate of the university sometimes found it difficult to work harmoniously, and its disposition to dictate was strongly resented by the distinguished metaphysician and professor Sir William Hamilton. On the other hand, the council sometimes exercised a beneficial discretion by appointing professors of ability whom the senate might have regarded as ineligible on the ground of their religious tenets. The Disruption of 1843 emancipated the lay professors from subscription to the Established Church of Scotland, and resulted in many of the important changes which were subsequently introduced in the Universities Act of 1858. On the 28th October, 1859, the town council, notwithstanding that their powers were already terminated by the provisions of the Act, availed themselves of a technical right to appoint a principal,—their choice falling upon Sir David Brewster. The great landmark in the history of the Scottish as in that of the English universities is represented by the remodelling of the several constitutions of these bodies in the year 1858. The commissioners of 1858–62 left the university of Edinburgh in the possession of constitutional autonomy, with its studies and degrees regulated by ordinances. The students also received the rectorial franchise, but were not, as at Glasgow and Aberdeen, divided into nations. In arts the B.A. degree was abolished, the M.A. representing the only degree in this faculty, as at the other Scottish universities. The course of study was divided into three departments: (1) classics; (2) mathematics, including natural philosophy; (3) mental science and English literature. In each department it was required that there should be an additional examiner besides the professor, so that the candidates should not be entirely examined by their own teachers. It was also provided that, instead of one examination for the degree at the end of a student's course, examinations in each of the departments might be passed separately. In the twenty years beginning with 1863, 1400 M.A. degrees have been conferred, as against 250 in the twenty years preceding. In the faculty of medicine, the original single degree of doctor of medicine gave place to three classes—bachelor of medicine (M.B.), master in surgery (C.M.), and doctor of medicine (M.D.). In 1866 it was further laid down that theses should no longer be demanded from candidates for the lower degrees of M.B. and C.M., and, on the other hand, that the degree of M.D. should not be conferred on persons not showing any evidence of medical study after leaving the university, but that a thesis should be invariably required. Since the enactment of these ordinances the number of the medical students has increased from about 500 to over 1700. In the faculty of law the title of the degree was to be LL.B., and it was to be conferred only on those who had already graduated as M.A. But the minor degree, that of "bachelor of law" (B.L.), might be conferred if the candidate had attended one course of lectures in the faculty of arts, and passed a preliminary examination in (1) Latin, (2) Greek, French or German, and (3) any two of the three subjects—logic, moral philosophy, and mathematics. The chair of public law, which had fallen into abeyance in 1832, was reconstituted, and the chair of universal civil history was converted into a professorship of history and constitutional law. The degree of doctor of laws was left, as before, a purely honorary degree. Chairs of Sanskrit, engineering, geology, commercial and political economy, education, fine art, and the Celtic languages have also been founded. By the Representation of the People (Scotland) Act, 1868, the universities of Edinburgh and St. Andrews were empowered to return jointly a member to the House of Commons.

A parliamentary return for the ten years ending 30th March, 1883, showed that the sums voted annually by parliament or chargeable on the consolidated fund to the four universities had amounted during that period to £65,821 [$319,890.06] for Aberdeen, £85,906 [$417,503.16] for Edinburgh, £66,182 [$321,644.52] for Glasgow, and £38,111 [$185,219.46] for St. Andrews. In addition to these sums Edinburgh had received £80,000 [$388,800] and Glasgow £20,000 [$97,200] in the form of special grants in aid.

Parliamentary grants to Scottish universities.

Trinity College, Dublin, was founded in 1591, under the auspices of Sir John Perrot, the Irish viceroy. A royal charter nominated a provost and a minimum number of three fellows and three scholars as a body corporate, empowered to established among themselves "whatever laws of either of the universities of Cambridge or Oxford they may judge to be apt and suitable; and especially that no other persons should teach or profess the liberal arts in Ireland without the queen's special license." The first five provosts of Trinity College were all Cambridge men, and under the influence of Archbishop Loftus, the first provost, and his successors, the foundation received a strongly Puritan bias. Prior to the year 1873, the provostship, fellowships, and foundation scholarships could be held only by members of the Church of Ireland; but all such restrictions were abolished by Act 36 Vict. c. 21, whereby the requirement of subscription to any article or formulary of faith was finally abrogated. As at present constituted, the ordinary government is in the hands of the provost and senior fellows in conjunction with the visitors and council,—the supreme authority being the crown, except so far as limited by Act of Parliament.

Trinity College, Dublin.

The first departure in Ireland from the exclusive system of education formerly represented by the foundation at Dublin, dates from the creation of the Queen's University, incorporated by royal charter 3d September, 1850. By this charter the general legislation of the university, together with its government and administration, was vested in the university senate. In 1864 the charter of 1850 was superseded by a supplementary charter, and the university reconstituted "in order to render more complete and satisfactory the courses of education to be followed by students in the colleges;" and finally, in 1880, by virtue of the Act of Parliament known as the University Education (Ireland) Act, 1879, the Queen's University gave place to the Royal University of Ireland, which was practically a reconstitution of the former foundation, the dissolution of the Queen's University being decreed so soon as the newly constituted body should be in a position to confer degrees; at the same time all graduates of the Queen's University were recognized as graduates of the new university with corresponding degrees, and all matriculated students of the former as entitled to the same status in the latter. The university confers degrees in arts (B.A., M.A., D.Litt.), science, engineering, music, medicine, surgery, obstetrics, and law. The preliminary pass examinations in arts are held at annually selected centres,—those chosen in 1885 being Dublin, Belfast, Carlow, Cork, Galway, Limerick, and Londonderry. All honor examinations and all examinations in other faculties are held in Dublin. The Queen's Colleges at Belfast, Cork, and Galway were founded in December, 1845, under an Act of Parliament "to enable Her Majesty to endow new colleges for the advancement of learning in Ireland," and were subsequently incorporated as colleges of the university. Their professors were at the same time constituted professors in the university, and conducted the examinations. But in the reconstruction of 1880 the chief share in the conduct of the examinations and advising the senate with respect to them was vested in a board of fellows, elected by the senate in equal numbers from the non-denominational colleges and the purely Catholic institutions. The colleges retain,

Queen's University.

Royal University of Ireland.

Colleges at Belfast, Cork, and Galway.

however, their independence, being in no way subject to the control of the university senate except in the regulations with respect to the requirements for degrees and other academic distinctions. On the other hand, the obligation formerly imposed of a preliminary course of study at one or other of the colleges before admission to degrees was abolished at the foundation of the Royal University, the examinations being now open, like those of the university of London, to all matriculated students on payment of certain fees.

There is at present no university of Wales, although the bestowal of a royal charter before long is confidently anticipated. The oldest college, that of St. David's at Lampeter, possesses the right of conferring degrees. It was founded in 1822 for the purpose of educating clergymen in the principles of the Established Church of England and Wales, mainly for the supply of the Welsh dioceses. The number of the professors in 1887 was 8, and the number of the students 120. The next college in order of foundation is Aberystwith. It was founded 9th October, 1872, but possesses no charter, and is mainly supported by the Dissenting bodies. The staff of professors numbers 13, and the students number 150. The University College of South Wales and Monmouthshire at Cardiff was founded in 1883. The number of professors in 1887 was 9, lecturers 4, demonstrators 2: number of students 140. The University College of North Wales at Bangor received its charter 4th June, 1885, its object being to "provide instruction in all the branches of a liberal education except theology." Its staff consists of a principal, 8 professors or lecturers, and 2 demonstrators; the number of the students is 127. There is also a hall of residence for women students. At each of these three last-named colleges students proceeding to degrees have to go through either a London, Edinburgh, Glasgow, or Dublin course of study, but at Edinburgh, Glasgow, and Dublin a certain proportion of the term of residence ordinarily required is remitted in their favor.

Colleges in Wales: St. David's, Aberystwith, South Wales, North Wales.

In India, the three older universities all date from 1857,—that of Calcutta having been incorporated January 24, Bombay July 18, Madras September 5, in that year. At these three universities the instruction is mainly in English. "A university in India is a body for examining candidates for degrees, and for conferring degrees. It has the power of prescribing text-books, standards of instruction, and rules of procedure, but is not an institution for teaching. Its governance and management are vested in a body of fellows, some of whom are *ex officio*, being the chief European functionaries of the state. The remainder are appointed by the Government, being generally chosen as representative men in respect of eminent learning, scientific attainment, official position, social status, or personal worth. Being a mixed body of Europeans and natives, they thus comprise all that is best and wisest in that division of the empire to which the university belongs, and fairly represent most of the phases of thought and philosophic tendencies observable in the country. The fellows in their corporate capacity form the senate. The affairs of the university are conducted by the syndicate, consisting of a limited number of members elected from among the fellows. The faculties comprise arts and philosophy, law, medicine, and civil engineering. A degree in natural and physical science has more recently been added" (Sir R. Temple, *India in* 1880, p. 145). The Punjab university was incorporated in 1883,—the Punjab University College, prior to that date, having conferred titles only and not degrees. The main object of this university is the encouragement of the study of the Oriental languages and literature, and the rendering accessible to native students the results of European scientific teaching through the medium of their own vernacular. The Oriental faculty is here the oldest, and the degree of B.O.L. (bachelor of Oriental literature) is given as the result of its examinations. At the Oriental College the instruction is given wholly in the native languages. In 1887 the senate at Cambridge (mainly on the representations of Mr. C. P. Ilbert, formerly vice-chancellor of the university of Calcutta) adopted resolutions whereby some forty-nine collegiate institutions already affiliated to the latter body were affiliated to the university of Cambridge, their students thus becoming entitled to the remission of one year in the ordinary statutable requirements with respect to residence at Cambridge. It is at these institutions, and the colleges of the first or second grade in the other presidencies, that the instruction is given.

Calcutta. Bombay. Madras. Punjab university.

In Australia, the university of Sydney was incorporated by an Act of the colonial legislature which received the royal assent 9th December, 1851, and on 27th February, 1858, a royal charter was granted conferring on graduates of the university the same rank, style, and precedence as are enjoyed by graduates of universities within the United Kingdom. Sydney is also one of the institutions associated with the university of London from which certificates of having received a due course of instruction may be received with a view to admission to degrees. There are four faculties, viz., arts, law, medicine, and science. The design of the university is to supply the means of a liberal education to all orders and denominations, without any distinction whatever. An Act for the purpose of facilitating the erection of colleges in connection with different religious bodies was, however, passed by the legislature during the session of 1884, and since that time colleges representing the Episcopalian, Presbyterian, and Roman Catholic Churches have been founded. In 1885 the total number of students attending lectures in the university was 206. The university of Melbourne, in the colony of Victoria, was incorporated and endowed by royal Act 22d January, 1853. This Act was amended 7th June, 1881. Here also no religious tests are imposed on admission to any degree or election to any office. The council is empowered, after due examination, to confer degrees in all the faculties (excepting divinity) which can be conferred in any university within the British dominions. It is also authorized to affiliate colleges; and Trinity College (Church of England) was accordingly founded in 1870 and Ormond College (Presbyterian) in 1879. The founding of a university for Queensland is at the present time in contemplation. The university of Adelaide in South Australia (founded mainly by the exertions and munificence of Sir Walter Watson Hughes) was incorporated by an Act of the colonial legislature in 1874, in which year it was further endowed by Sir Thomas Elder. In 1881 letters patent were granted by the English crown whereby degrees conferred by the university were constituted of equal validity with those of any university of the United Kingdom. The faculties in the university are those of arts, medicine, law, science, and music. The number of matriculations since the foundation amounted in 1886 to 284, the number of undergraduates in that year being 90.

Sydney. Melbourne. Adelaide.

The university of New Zealand, founded in 1870, and reconstituted in 1874 and 1875, is empowered by royal charter to grant the several degrees of bachelor and master of arts, and bachelor and doctor in law, medicine, and music. Women are admitted to degrees. To this the Auckland University College, Nelson College, Canterbury College, and the university of Otago stand in the relation of affiliated institutions. This last-named institution was founded in 1869 by an order of the provincial council, with the power of conferring degrees in arts, medicine, and law, and received as an endowment 100,000 acres of pastoral land. It was opened in 1871 with a staff of three professors, all in the faculty of arts. In 1872 the provincial council further subsidized it by a grant of a second 100,000 acres of land, and the university was now enabled to make considerable additions to the staff of professors and lecturers, to establish a lectureship in law, and to lay the foundations of a medical school. In 1874 an agreement was made between the university of New Zealand and that of Otago, whereby the functions of the former were restricted to the examination of candidates for matriculation, for scholarship, and for degrees; while the latter bound itself to become affiliated to the university of New Zealand, to hold in abeyance its power of granting degrees, and to waive the claim which it had advanced to a royal charter. As the result of this arrangement, the university of Otago became possessed of 10,000 acres of land which had been set apart for university purposes in the former province of Southland. In 1877 a school of mines was established in connection with the university.

New Zealand. Otago.

In Canada the McGill College and University at Montreal was founded by royal charter in 1821 (amended in 1852) on the foundation of the Honorable James McGill, who died at Montreal 19th December, 1813. A number of colleges and schools throughout the province stand in the relation of affiliated institu-

Montreal.

tions. The university is Protestant but undenominational. It includes the faculties of arts, applied sciences, medicine, and law. In 1885 the total number of students, including women, was 526. The university of Toronto was originally established by royal charter in 1827, under the title of King's College, with certain religious restrictions, resembling those at that time in force at the English universities, but in 1834 these restrictions were abolished, and in 1849 the designation of the university was changed into that of the university of Toronto. In 1873 further amendments were made in the constitution of the university. The chancellor was made elective for a period of three years by convocation, which was at the same time reorganized so as to include all graduates in law, medicine, and surgery, all masters of arts, and bachelors of arts of three years standing, all doctors of science, and bachelors of science of three years standing. The powers of the senate were also extended to all branches of literature, science, and the arts, to granting certificates of proficiency to women, and to affiliating colleges. The work of instruction is performed by University College, which is maintained out of the endowment of the provincial university, and governed by a council composed of the residents and the professors. Its several chairs include classical literature, logic and rhetoric, mathematics and natural philosophy, chemistry and experimental philosophy, history and English literature, mineralogy and geology, metaphysics and ethics, meteorology and natural history and lectureships on Oriental literature, German and French. Other universities and colleges with power to confer degrees are the Victoria University at Cobourg (1836), supported by the Methodist Church of Canada; Queen's University, Kingston (1841), representing the Presbyterian body; and the university of Trinity College, Toronto, founded in 1851 on the suppression of the faculty of divinity in King's College. Lennoxville is a centre for university instruction in conformity with Church of England principles.

Toronto.

Other Canadian universities.

In Africa, an Act for the incorporation of the university of the Cape of Good Hope received the royal assent 26th June, 1873, the council being empowered to grant degrees in arts, law, and medicine.

Cape of Good Hope.

In the United States of America[1] university education has received a great extension, without, however, exercising in Europe that reflex influence discernible in so many other relations. The report of the Commissioner of Education for 1883–84 gives a list of no less than 370 degree-giving universities or colleges; but of these a large proportion are sectarian, others represent only a single faculty, and nearly nine-tenths have been founded within the last thirty-five years. Although a higher education has unquestionably been thus very widely diffused, the undue multiplication of centres has, in some provinces, lowered the standard of attainment and led to a consequent depreciation in the value of university degrees. This tendency it was sought to counteract in the State of Ohio, some twenty-five years ago, by an organization of the different colleges. The instruction given is, in most cases, almost gratuitous, the charge to each student being less than 30 dollars a year. This cheapening of a higher education is not, however, attended with quite the same results as in Germany (where lads with little aptitude for a professional career are thus attracted to the professions), the rapidly increasing population and the wider scope for mechanical or agricultural pursuits probably exercising a beneficial counteracting influence.

Universities of the United States.

[1] [For further information see UNIVERSITY EXTENSION, in vol. xxix.—AM. ED.]

The distinguishing characteristics which belong to these numerous centres are described by the president of the Johns Hopkins University, in an address delivered at Harvard in 1886, as suggestive of four different classes of colleges,—(1) those which proceed from the original historic colleges, (2) those established in the name of the State, (3) those avowedly ecclesiastical, (4) those founded by private benefactions. To the first class belong Harvard College and Yale College with their offshoots. Of these two, the former was founded in 1638 at Cambridge, Massachusetts, by a former fellow of Emmanuel College at Cambridge in England, and represented the Puritan tenets for which the parent society was at that time noted; the latter was founded in 1701 by the combined action of a few of the ministers of the State, a charter being given in the same year by the colonial legislature. It was for a long time chiefly supported by the Congregationalists, but is now unsectarian. The total number of students at Harvard in 1882 was 988, at Yale 692. The university of Pennsylvania was founded in 1751 by Thomas Penn and Richard Penn, on the lines of a scheme drawn up by Benjamin Franklin, and was from the first placed on a basis comprising all denominations.[1] It is distinguished by the liberality with which it has opened its courses of instruction to the inhabitants of the city generally; the degree of Ph.D. is conferred on all comers after due examination.[2] At Haverford and Lafayette Colleges, and also at the Lehigh university, "advanced degrees" are offered "only for higher study, prolonged beyond the collegiate course," instead of being conferred as a matter of routine after a certain term of years. The Johns Hopkins University, also an unsectarian body, was founded at Baltimore in 1867, and is already a school of established reputation, and especially resorted to by those designing to follow the profession of teachers. It is also distinguished by the possession of fellowships, to be held only by students intending to pursue some especial line of original research. Other steadily growing centres are Columbia College in New York, founded in 1754; the Cornell University, also unsectarian, recently enriched by the acquisition of a considerable endowment; Brown University in Providence; and those of Princeton, Michigan, Virginia, and California. At Amherst College, where the number of students in 1882 was 339, the experiment has recently been made of partially dispensing with examinations during the course of study, where the students give evidence of having made satisfactory progress. Considerable modifications have also taken place in the courses of study, nearly all the colleges having now adopted the system of "parallel courses," and the principle of selection between these. Female education has received in America an extension which it has attained in no other country, and one of the colleges (that of Wellesley) numbers several hundred students. Since the war of 1861 a greatly increased attention has been given throughout the universities to physical training and athletic exercises, and excellent gymnasia, constructed on German models, have been erected.

Amherst College.

The accompanying table (IV., p. 913), prepared by the Commissioner of Education for the year 1883–84, shows the distribution of these centres in the different States, together with their numbers, revenues, libraries, and the estimated value of their endowments.

[1] [For the origin of Pennsylvania College in 1755 see vol. xviii. p. 753.—Am. Ed.]

[2] [The University of Pennsylvania confers the degree of Ph.D. in course on its scientific students and as an honor. The Johns Hopkins grants it to all comers who have passed one year in attendance on its post-graduate lectures and sustained a satisfactory examination.—Am. Ed.]

[1] *Authorities.*—On the earlier history and organization of the mediæval universities, the student should consult F. C. von Savigny, *Gesch. d. römischen Rechts im Mittelalter*, 7 vols., 1826–51; for the university of Paris, Du Boulay, *Historia Universitatis Parisiensis*, 6 vols., Paris, 1665, Crevier, *Hist. de l' Université de Paris*, 7 vols., Paris, 1761, and C. Jourdain, *Hist. de l' Université de Paris au XVIIme et au XVIIIme Siècle*, Paris, 1862; of these the work of Du Boulay (Bulæus) is one of great research and labor, but wanting in critical judgment, while that of Crevier is little more than a readable outline drawn from the former. The views of Du Boulay have been challenged on many important points by F. H. Denifle in the first volume of his *Die Universitäten des Mittelalters bis* 1400 (1885), and more particularly on those relating to the organization of the early universities. The work of Meiners, *Gesch. d. Entstehung u. Entwickelung der hohen Schulen unsers Erdtheils*, 4 vols. (1802–5), must be regarded as almost superseded as a general history, and the same may be said of Huber's work on the English universities, *Die englischen Universitäten* (Cassel, 1839–40), translated by F. W. Newman, 3 vols. (1845). Much useful criticism on both the English and the Continental universities will be found in Sir W. Hamilton's *Discussions*, etc., 1853. For the German universities, the works of Zarncke, *Die deutschen Universitäten im Mittelalter* (Leipsic, 1857), and Paulsen, *Gesch. d. gelehrten Unterrichts auf den deutschen Schulen und Universitäten* (Leipsic, 1885), will be found the most trustworthy,—the former for the mediæval, the latter for the modern period. To these may be added two articles by Paulsen in vol. xlv. of Von Sybel's *Historische Zeitschrift:* (1) "Gründung" and (2) "Organisation u. Lebensordnungen d. deutschen Universitäten im Mittelalter"; Tholuck, *Das akademische Leben des* 17 *Jahrhunderts*, 2 vols. (Halle, 1853–54); Von Raumer, *Gesch. d. Pädagogik*, vol. iv. (4th ed., 1872); Dolch, *Gesch. d. deutschen Studententhums* (1858); Sybel, *Die deutschen Universitäten* (2d ed., 1874); and Dr. J. Conrad, *The German Universities for the last Fifty Years*, translated by Hutchinson, with preface by James Bryce, M.P. (Glasgow, 1885). For Oxford, there are the laborious collections by Anthony Wood,—*History and Antiquities of the University and of the Colleges and Halls of Oxford*, edited with continuation by Rev. J. Gutch, 5 vols. (1786–96), and *Athenæ* and *Fasti Oxonienses*, edited by Dr. P. Bliss, 4 vols. (1813–20); also the publications of the Oxford Historical Society; *A History of the University of Oxford from the Earliest Times to* 1530, by H. C. Maxwell Lyte (1886); and *Statutes of the University of Oxford compiled in* 1636 *under Authority of Archbishop Laud*, ed. Griffiths (Oxford, 1888). For Cambridge, the researches of C. H. Cooper, greatly surpassing those of Wood in thoroughness and impartiality, are comprised in three series: (1) *Annals of Cambridge*, 4 vols. (1842–52); (2) *Athenæ Cantabrigienses*, 1500–1609, 2 vols. (1858–61); (3) *Memorials of Cambridge*, 3 vols. (new ed., 1884). The *Architectural History of the University of Cambridge and of the Colleges*, by the late Robert Willis, edited and continued by J. Willis Clark, 4 vols. (1886), is a work of admirable thoroughness and completeness. To these may be added *Cambridge in the Seventeenth Century: Lives of Nicholas Ferrar and Matthew Robinson*, by Prof. John E. B. Mayor, 2 vols. (1855, 1856); and Baker's *History of the College of St. John the Evangelist, Cambridge*, edited by Mayor, 2 vols. (1869); also J. B. Mullinger, *History of the University of Cambridge from the Earliest Times to Accession of Charles I.*, 2 vols. (1873–85). For both universities see the *Documents* issued by the Oxford and Cambridge Commissions of 1858; also the Wood, Hearne, Tanner, and Rawlinson MSS., and the Cottonian, Harleian, Lansdowne (especially Kennett and Strype), Baker, and Cole collections. (J. B. M.)

UNTERWALDEN is one of the Forest cantons of Switzerland, ranking as sixth in the Confederation. It is composed of two valleys through which run two streams both called the Aa, and which are called Obwald and Nidwald from their position with regard to the great forest of the Kernwald in which they are situated. In old documents the inhabitants are always described as "homines intramontani," whether "vallis superioris" (Obwald) or "vallis inferioris" (Nidwald). The total area of Obwald is 183.3 square miles, 154.2 of which are classed as productive (forests 37.6), while of the remainder 3.8 are covered by glaciers and 4.3 by lakes. The area of Nidwald is 112.1 square miles, 84.1 being productive (forests 27.7); of the rest the cantonal bit of the Lake of Lucerne covers 12.8. The highest point in the canton is the Titlis (10,627 feet) in Obwald.

The census of 1880 returned the population of Obwald as 15,356, an increase of 941 on 1870, and that of Nidwald as 11,992, an increase of 291. In both the women have a small majority over the men. The native tongue of practically the whole population is German (15,254 in Obwald, 11,869 in Nidwald), and they are nearly all Roman Catholics (15,078 in Obwald, 11,901 in Nidwald). Till 1814 the canton was in the diocese of Constance; since that time it has (like Uri) formed legally part of no diocese, though it is provisionally administered by the bishop of Chur. The capital of Obwald is Sarnen (4039 inhabitants), Kerns (2500) being the only other place which is more than a village; that of Nidwald is Stanz (2210). The population is purely agricultural and pastoral. In Obwald the forests are remarkable, in Nidwald the fiery energy of the inhabitants. In educational matters the standard is not very high, but is being gradually raised. At the head of the Nidwald valley (but legally in Obwald) stands the great Benedictine monastery of Engelberg, founded in 1121. There are no railways, but one is being made from Lucerne through Obwald over the Brünig Pass to Meyringen in Bern.

Historically Obwald was part of the Aargau, and Nidwald of the Zürichgau. In both there were many great landowners (specially the abbey of Murbach and the Hapsburgs) and few free men; while the fact that the Hapsburgs were counts of the Aargau and the Zürichgau further delayed the development of political freedom. Both took part in the risings of 1245–47, and in 1248 Sarnen was threatened by the pope with excommunication for opposing its hereditary lord, the count of Hapsburg. The alleged cruelties committed by the Hapsburgs do not, however, appear in history till Justinger's *Chronicle*, 1420 (see TELL). On April 16, 1244, Rudolph the future emperor bought from Murbach all its estates in Unterwalden and thus ruled this district as the chief landowner, as count, and as emperor. On 1st August, 1291, Nidwald formed the "Everlasting League" with Uri and Schwyz (this being the first known case in which its common seal is used), Obwald joining a little later on. In 1304 the two valleys were joined together under the same imperial bailiff, and in 1309 Henry VII. confirmed to them all the liberties granted by his predecessor—though none are known to have been granted. However, this placed Unterwalden on an equal political footing with Uri and Schwyz; and as such it took part in Morgarten fight (also driving back an invasion over the Brünig Pass) and in the renewal of the Everlasting League at Brunnen (1315), as well as at Sempach (1386), and in driving back the Gugler or English freebooters (1375). For physical reasons, it was difficult for Unterwalden to enlarge its territories. Yet in 1368 it acquired Alpnach, and in 1378 Hergiswyl. So too Obwald shared with Uri in the conquest of the Val Leventina (1403), and in the purchase of Bellinzona (1419), as well as in the loss of both (1426). It was Nidwald that, with Schwyz and Uri, finally won (1500) and ruled (till 1798) Bellinzona, Riviera, and Val Blegno: while both shared in conquests of Aargau (1415), Thurgau (1460), and Locarno, etc. (1512), and in the temporary occupation of the Val d'Ossola (1410–14 to 1417–22). In the Burgundian war Unterwalden, like the other Forest cantons, long hung back through jealousy of Bern, but came to the rescue in time of need. In 1481 it was at Stanz that the Confederates nearly broke up the League for various reasons, and it was only by the intervention then of the holy hermit Nicholas von der Flüe (of Saehseln in Obwald) that peace was restored, and the great federal agreement known as the compact of Stanz concluded. Like the other Forest cantons, Unterwalden clung to the old faith at the time of the Reformation, being a member of the "Christliche Vereinigung" (1529) and of the Golden League (1586).

In 1798 Unterwalden resisted the Helvetic republic, but, having formed part of the short-lived Tellgau, became a district of the canton of the Waldstätten. Obwald submitted at an early date, but Nidwald, refusing to accept the oath of fidelity to the constitution mainly on religious grounds, rose in desperate revolt (September, 1798), and was only put down by the arrival of 15,000 armed men and by the storming of Stanz. In 1803 its independence as a canton was restored, but in 1815 Nidwald refused to accept the new constitution, and federal troops had to be employed to put down its resistance, the punishment inflicted being the transfer to Obwald of the jurisdiction over the abbey lands of Engelberg (since 1421 "protected" by both valleys), which in 1798 had fallen to the lot of Nidwald. Since that time the history of Unterwalden has been like that of the other Forest cantons. It was a member of the "League of Sarnen" (1832), to oppose the reforming wishes of other cantons, and of the "Sonderbund" (1843); it was defeated in the war of 1847; and it voted against the acceptance of the federal constitution both in 1848 and in 1874. It forms at present two half cantons, each sending one representative to the federal "assembly of states." In local matters the two valleys are independent. In each the supreme authority is the "landsgemeinde" (meeting on the last Sunday in April), composed of all male citizens of twenty (Obwald) or eighteen (Nidwald) years of age, while the cantonal council, which drafts measures and sanctions the expenditure of sums below certain fixed small amounts, is composed in Obwald of 80 members (including the executive council) elected by the people for 4 years, and in Nidwald of 48 (besides the executive council) chosen in the same way for 6 years. The executive council is in both cases elected by the "landsgemeinde;" in Obwald it consists of 3 officials and 4 ordinary members, and in Nidwald of 6 officials and 5 ordinary members,—the official members being chosen every year, the ordinary every 4 or 3 years respectively. The existing constitution of Obwald is that of 1867; that of Nidwald is dated 1850, and was amended in 1877–78.

It is very remarkable that in both valleys the old "common lands" are still in the hands of the old guilds, and "gemeinden" consist of natives, not merely residents, though in Obwald these contribute to the expenses of the

new "political communes" of residents, while in Nidwald the latter have to raise special taxes. In Engelberg (which still retains some independence) the poor are greatly favored in the division of the common lands and their proceeds, and unmarried persons (or widowers and widows) receive only half the share of those who are married.

See J. Businger, *Die Geschichten des Volkes von Unterwalden*, 2 vols., 1827–28.

UNYORO, a kingdom of Central Africa, bounded on the N. and E. by the Nile, on the W. by the Albert Nyanza, and on the S.E. by the kingdom of Uganda. Its area is about 1600 square miles. The country is very fertile, well-watered, and thickly wooded; for the most part it is hilly in character, especially on the borders of the Albert Lake and in the neighborhood of Massindi and Kiroto, where the mountains have an altitude of from 5000 to 6000 feet. The population is about 1,500,000. The Wanyoro are of a dark reddish-brown color, and are fully clothed, but are not so fine in physique, nor so high in intellectual development as their neighbors the Waganda, to whom, however, they appear to be very nearly related. The reigning family in Unyoro belongs to the Wahuma tribe, and is probably the oldest reigning Wahuma family in this part of Africa. The country is governed on the feudal system. Numerous tribes to the east and north of the Nile, and also on the western side of the Albert Nyanza, pay a small tribute to the Wanyoro. The latter possess large herds of cattle, and are very good herdsmen. The land, too, is cultivated to a considerable extent,—bananas, sweet potatoes, and dhurra being grown in large quantities. Coffee and tobacco are cultivated to a small extent. The people are very superstitious, and the numerous medicine men and women reap a rich harvest from their credulity. The Wanyoro huts are dome-shaped, small, and extremely filthy and full of vermin, although the people themselves are cleanly. Polygamy is universal, even the poorest man possessing two or three wives. Notwithstanding this, the people are fairly moral; but Unyoro is remarkable amongst Central African tribes for the existence of a definite class of courtesans. The Wanyoro are moderately skilful workmen, and their iron-work, pottery, and wood-work are both neat and tasteful. The only article they export is salt, which is obtained in considerable quantities at Kibiro on the shores of Lake Albert.

See Baker's *Albert Nyanza*, Felkin and Wilson's *Uganda and the Egyptian Soudan*, and various papers in *Petermann's Mittheilungen* by Emin Pasha.

UPANISHADS. See Sanskrit, vol. xxi. pp. 287, 289, 294, and Brahmanism.

UPAS, a Javanese word meaning poison, and specially applied by the Malays and people of western Java to the poison derived from the gum of the anchar tree (*Antiaris toxicaria*), one of the *Artocarpeæ*, which was commonly used in Celebes to envenom the bamboo darts of the natives. The name of the upas tree has become famous from the mendacious account (professedly by one Foersch, who was a surgeon at Samarang in 1773) published in the *London Magazine*, December, 1783, and popularized by Erasmus Darwin in "Loves of the Plants" (*Botanic Garden*, pt. ii.). The tree was said to destroy all animal life within a radius of 15 miles or more. The poison was fetched by condemned malefactors, of whom scarcely two out of twenty returned. All this is pure fable, and in good part not even traditional fable, but mere invention.

For a scientific account of the *Antiaris*, see Horsfield's *Plantæ Javanicæ Rariores* (1838–52) and Blume's *Rumphia* (Brussels, 1836), and for the legend Yule, *Anglo-Indian Glossary*, p. 726 *sq.*

UPPER SIND FRONTIER, a district of British India, forming the northernmost portion of the province of Sind, in the Bombay presidency. It comprises an area of 2139 square miles, and lies between 27° 56′ and 28° 27′ N. lat. and between 68° and 69° 44′ E. long. It is bounded on the N. and W. by the Derajat districts of the Punjab and the territory of Khelat, on the S. by Shikarpur district, and on the E. by the Indus. In the northeast the country is hilly; the remainder consists of a narrow strip of level plain, one half being covered with jungle and subject to inundation, from which it is protected by artificial embankments. The land is watered by canals from the Indus, of which the chief is the Begári (85 miles in length), navigable throughout by large boats, and the Desert Canal, which irrigates the country west of Kashmir. The district contains several thriving timber plantations. The wild animals comprise an occasional tiger and hyenas; wild hogs and jackals abound; foxes are occasionally met with; and antelopes, hog-deer, and a species of *sámbhar* deer are found in the dense jungle tracts adjoining the Indus. The climate is remarkable for its dryness and for its extraordinary variations of temperature. The average annual rainfall at Jacobabad is less than 5 inches. There are numerous roads of all descriptions, and the Frontier Military Railway from Sukkur *via* Jacobabad to Sibi crosses the district.

The census of 1881 returned the population as 124,181 (males 70,166, females 54,015),—Hindus numbering 9894, Mohammedans 109,183, and Christians 230. The chief town is Jacobabad, with a population of 7365. In 1885–86 the cultivated area was estimated at 361,415 acres, of which 137,149 were cropped, and of these again 8163 were cropped more than once. The principal crops are wheat, joar, bajra, rice, barley, mustard-seed, and a little cotton and gram. Salt, lacquered work, leathern jars, embroidered shoes, woollen carpets, and saddle-bags are the principal manufactures. The internal trade is principally in grain, the greater part of which is sent to the Punjab, and the transit trade from Central Asia into Sind crosses the district, bringing wool and woollen goods, fruits, carpets, and horses.

UPSALA, a city of Sweden, the seat of its oldest university and residence of the archbishop of Sweden, is situated on the small river Fyris, 42 miles north of Stockholm. In spite of its position in a vast and fertile plain, Upsala was a rather insignificant little town till the opening of railway communication in 1866. The population, which in 1840 was only 5100, had at the end of 1885 increased to more than 20,000 (with students, scholars, and others, 23,000). The industries of the place are still unimportant, but its trade by sea (navigation being open for six or seven months of the year) and by rail is somewhat livelier. Upsala owes its fame to its university, which was founded in 1477. In 1624 Gustavus Adolphus endowed it with 300 farms, the revenue of which formed its entire income for more than two hundred years. Parliament now contributes nearly the half of its whole revenue (393,300 crowns, or about £21,800 [$105,948], in 1885). The professors numbered 58 in 1887, with 61 "docents" and assistant teachers, and there were 1928 students. The last-named are divided into 13 "nations" (based on the old ecclesiastical divisions of the country), almost every one of which possesses a house of its own, with a hall, reading-rooms, and library. About £7200 [$34,992] is distributed yearly in "stipendia" or scholarships. The new university house, above the cathedral, on the site of the former archbishop's castle, is in the Renaissance style, and was built in 1879–87. It has a great hall capable of holding 2000 persons, eleven lecture-rooms, etc. The vestibule, lighted from above by three large cupolas, and surrounded by open galleries, is particularly fine. The library building (called Carolina Rediviva, in remembrance of the Carolina which formerly existed near the cathedral) was erected in 1819–41. The library, which has a right to a copy of every book printed in Sweden, at present (1887) contains 250,000 volumes and 11,000 MSS., among which is the famous *Codex*

Argenteus of Ulfilas's translation of the Gospels. The "Gustavianum," built by order of Gustavus Adolphus for a university house, is now wholly occupied by the zoological institution. The botanical garden (which formerly belonged to the castle) was presented by Gustavus III. to the university in 1787, —the former garden (in the northern part of the city), where Rudbeck and Linnæus worked, and where the residence of the latter is still to be seen, having been found too small and inconvenient. The medical faculty possesses a hospital and anatomical, chemical, and pathologico-physiological institutions; and about a mile from the town there is a magnificent lunatic asylum. The astronomical and meteorological institutions, as well as those of chemistry and physics, have also special buildings, all of recent date. The Royal Society of Sciences, established in 1710 by Eric Benzelius, the younger, occupies a house of its own, and has a valuable library. Of the buildings the cathedral, founded in the latter part of the 13th century and completed in 1435, is the most remarkable. The material is brick, but the proportions are uncommonly noble and harmonious; the length is 390 feet, and the height inside 88. It has suffered considerably from repeated fires, but since 1886 an extensive restoration has been going on. The castle, on the summit of a long ridge above the town, was founded in 1548 by Gustavus I., but not finished till a century later, when it was often used as a royal residence. It was destroyed by fire in 1702, and for more than forty years remained a ruin. At present only a small part of it is habitable, and that part is chiefly used by the provincial government, and as a residence of the governor. Apart from the cathedral and a few insignificant houses, there are no remains from the mediæval period, the city formerly having consisted almost entirely of wooden houses.

The name of Upsala originally belonged to a place nearly 2 miles to the north of the present city, which is still called Old Upsala. This Upsala, mentioned as early as the 9th century, was famous throughout Scandinavia for its splendid heathen temple, which, gleaming with gold, made it the centre of the Svithiod, then divided into a great number of kingdoms; three huge grave mounds or barrows still commemorate old times. In the same place the first cathedral of the bishop of Upsala was also erected (about 1100). On the destruction of this building by fire, the inconvenient situation caused the removal in 1273 of the archiepiscopal see to the present city, then called Ostra Aros,[1] but within a comparatively short time it came to be generally called Upsala. During the Middle Ages the cathedral and the see of the archbishop made Upsala a kind of ecclesiastical capital. There the kings were crowned, after the election had taken place at the Mora stones, 10 miles southeast of Upsala. As early as the 14th century, however, Stockholm became the proper residence of the king. In 1567 Erik XIV. murdered in the castle five of the most eminent men of the kingdom, three of them belonging to the family of Sture. In 1593 was held the great synod which marks the final victory of Protestantism in Sweden; in the same year the university was restored by Charles IX. In the castle Christina, daughter of Gustavus Adolphus, resigned her crown to Charles X. in 1654. In 1702 nearly the whole city, with the castle and the cathedral, was burnt down. Among the teachers of the university who have carried its name beyond the boundaries of their own country, the following (besides Linnæus) deserve to be mentioned: Olof Rudbeck the elder, the author of the *Atlantica* (1630–1702); Torbern Bergman (1735–1784), the celebrated chemist; and Erik Gustaf Geijer (1783–1847), the historian.

[1] The name first occurs in Snorro Sturluson in connection with the events of the year 1018; it signifies "the mouth of the eastern river."

End of Volume Twenty-third.

NOTABLE CHRONOLOGICAL EVENTS

NOTABLE CHRONOLOGICAL EVENTS

THE CHRONOLOGICAL TABLE here appended is a continuation of the record of important events and historical data published in fifth volume, pages 625–660, and closing with the year 1875.

The following record begins with the year 1876, and extends to the date included by the latest edition of this work.

1876

January 31. Administrative Reform Note was presented to Turkey by the Great Powers.
February 27. Don Carlos retired from Spain.
March 13. Khokand incorporated in the Russian Empire.
May 10–October 10. Centennial Exposition at Philadelphia.
May 15–20. Turkish massacres in Bulgaria.
June 3. First railway opened in China.
June 25. The slaughter of General Custer and his entire command of nearly 300 United States troops, in the Black Hills, by the Sioux Indians under Sitting Bull.
July 2. Servia and Montenegro declared war against Turkey.
October 15. General Martinez Campos sent to Cuba with a Spanish army to suppress the insurrection.
November 6. The Hayes-Tilden election for President of the United States.
December 24. Meeting in Constantinople of the Plenary Conference on Turkish affairs.

1877

January 1. Queen Victoria proclaimed Empress of India at Delhi.
January 20. Administrative reform proposals of the Powers declined by the Porte.
January 24. Anti-Clerical Bill passed by the Italian Chamber of Deputies.
February 18. General Porfirio Diaz elected President of Mexico.
February 23. Japanese rebels defeated near Kagosima.
March 1. Treaty of peace effected between Turkey and Servia.
March 31. Protocol relative to the Eastern question signed by the Great Powers.
April 12. Sir Theophilus Shepstone proclaimed the Transvaal annexed to the British Crown.
May 16. The French Ministry resigned on account of the reproof administered by Marshal McMahon.
May 21. Independence of Rumania proclaimed.
August 17. Crete insurrection.
September 17. General Gourko defeated the Turks at the Shipka Pass.
November 24. Canadian fisheries award granted.
November 28. Capital punishment abolished by the Italian Chamber of Deputies.
December 13. Declaration of independence by Servia, and war against Turkey.

1878

January 9. Victor Emmanuel died.
January 20. Adrianople occupied by the Russians.
January 31. Armistice between Russia and Turkey.
February 1. Greek troops ordered to occupy Thessaly, Epirus, and Macedonia.
February 7. Pope Pius IX. died, aged 86 years.
February 13. Passage of the Dardanelles by the British fleet.
February 16. The Bland Silver Bill passed the United States Senate.
May 1. Paris Exposition opened.
May 31. *Grosser Kurfürst*, the German ironclad, foundered.
June 2. Dr. Nobiling made attempt on the life of the German Emperor.
July 13. Berlin Treaty signed.
July 14. British Empire annexed Cyprus.
August 27. Earthquakes in Germany, Belgium, and Holland.
October 19. German Anti-Socialist Bill passed in the Reichstag.
November 26. The Dobrudja occupied by Rumania.
December. Phonograph invented.

1879

January 2. Specie payments resumed in the United States.
January 30. Marshal McMahon resigned the presidency of France.
February 8. Russo-Turkish treaty of peace signed.
March 20. Russian evacuation of Adrianople.
April 5. Chili declared war against Peru.
April 30. Anglo-German treaty for the suppression of African slave trade.
May 8. Ukase against Nihilism in Russia.
July 13. The German Reichstag passed Protective Tariff Bill.
September 14. New insurrection in Cuba.
September 17. International Exhibition opened at Sidney, N. S. W.
October 30. First Legislative Assembly of Bulgaria opened.
December 2. Attempted assassination of the Czar near Moscow.
December 30. Attempt to shoot the King and Queen of Spain.

1880

January 16. Bill to abolish slavery in Cuba passed by Spain.
February 17. Attempt on the life of the Czar at the Winter Palace.
March 1. Irish Distress Relief Bill passed.
March 12. Chilians captured Mollendo.

March 14. The assassination of the Grand Shereef of Mecca.
April 19. Proclamation of Albanian independence.
April 21. Resignation of Lord Beaconsfield.
April 23. Mr. Gladstone appointed Prime Minister.
April 30. Foreign Jews expelled from St. Petersburg.
June 29. France annexed Tahiti.
September 22. Combination to retaliate on Captain Boycott on account of his attempt to evict tenants.
November 3. Mr. Parnell arrested for conspiracy.
December 16. Mr. Paul Kruger and others proclaimed the Transvaal a republic.
December 20. Boers attacked British troops at Bronker's Spruit.
December 22. George Eliot's death.
December 30. Destructive floods in Holland.

1881

January 25. Jury disagreed in the trial of Mr. Parnell and his associates for conspiracy.
February 1. First work done on the Panama Canal by the French Company.
February 6. Death of Thomas Carlyle.
March 6. Armistice between the English and the Boers.
March 13. Czar Alexander II. assassinated.
March 21. Peace between the English and Boers.
April 3. Five thousand lives lost in earthquake at Chios.
April 19. Death of Lord Beaconsfield.
International monetary conference at Paris.
May 16. Attempt to blow up the Liverpool Central Police Station.
May 17. Publication of the revised edition of the New Testament.
May 28. Fortune Bay Fishery Award of $75,000 to America by Great Britain.
June 8. Great fire at Quebec.
June 10. Attempt to blow up Liverpool Town Hall.
July 2. President Garfield shot.
August 3. Convention with the Transvaal Republic and British suzerainty retained.
September 9. Mutiny of Egyptian troops under Arabi Bey.
September 19. Death of President Garfield from the effects of the assassin's bullet.
September 22. Vice-President Chester A. Arthur sworn in as President of the United States
October 18. "No rent" Manifesto by the Irish Land League.
November 12. M. Gambetta became Premier of France.
December 8. Ring Theatre, Vienna, destroyed by fire and hundreds of lives lost.

1882

January 26. M. Gambetta's Ministry resigned.
February 28. Trial of Nihilists at St. Petersburg.
March 2. Attempt to shoot Queen Victoria at Windsor, by R. Maclean.
March 24. Death of H. W. Longfellow.
April 19. Death of Charles R. Darwin.
April 27. Death of Ralph Waldo Emerson.
May 6. Murder of Lord Frederick Cavendish, Secretary for Ireland, and T. A. Burke, Under-Secretary, in Phœnix Park, Dublin.
May 12. Death of General Kaufmann, conqueror of Turkestan.
May 18. New Eddystone lighthouse opened.
June 2. Death of Garibaldi.
June 11. Many Europeans killed in riot at Alexandria.
July 11. Alexandria forts bombarded by the British fleet.
July 17. Marines landed at Alexandria.
September 14. Surrender of Arabi Pasha and British occupation of Cairo.
December 3. Arabi Pasha banished from Egypt for life.
December 31. Death of Gambetta.

1883

January 16. Prince Napoleon arrested for publishing a manifesto against the Republic.
January 29. Ctywayo reinstated King of Zululand.
February 8. Messrs. Davitt, Healy, and Quinn imprisoned for sedition.
February 13. Death of Richard Wagner.
February 21. M. Jules Ferry reinstated Prime Minister of France.
March 14. Death of Karl Marx.
March 15. Attempts to blow up the Local Government Board office, and *The Times* office, London, with dynamite.
April 10. Trial of Irish "Invincibles."
April 23. Impeachment of the Norwegian Ministry.
May 1. International Exhibition opened at Amsterdam.
May 7. Royal College of Music opened by the Prince of Wales.
May 9. S. J. Paulus Kruger elected President of the Transvaal Republic.
May 11. The Pope expressed condemnation of the Land League.
May 12. The Prince of Wales opened the International Fisheries Exhibition at South Kensington.
May. 27. Coronation of Alexander III., Czar of Russia.
July 2. Captain Webb drowned in an attempt to swim Niagara Rapids.
July 20. Irish informer, James Carey, shot.
August 4–9. Military mutiny in Spain suppressed.
August 27. Thousands of lives lost by eruption of Krakatoa.
September 27. German war monument on the Neiderwald, Rüdesheim, unveiled.
December 11. Irish "national tribute" of £38,000 presented to Mr. Parnell in Dublin.
December 21. Ten dynamiters sentenced to penal servitude at Glasgow.
December 28. Colonel Soudeikin, chief of the Russian police, assassinated by Nihilists.

1884

February 27. Convention between the Transvaal Republic and Great Britain signed in London.
April 11. Death of Charles Reade.
May 8. Health Exhibition opened at South Kensington.
May 11. Provisional treaty of peace between France and China.
June 28. European conference on Egypt met in London.
July 1. International Forestry Exhibition opened in Edinburgh.
August 4. International Conference on Education opened at South Kensington.
August 6. The French bombarded Ki-lung, Formosa.
September 7. Political riots in Brussels and Antwerp.
November 7. Grover Cleveland elected President of the United States.
November 15. Berlin Conference on West African affairs opened.
November 18. Imperial Federation League formed.
December 13. Attempt to blow up London bridge with dynamite.
December 25–31. Over 1,000 lives lost in Spain by earthquakes.

1885

March 30. Russians under General Komaroff attacked Afghan forces on the Kushk.
May 4. International Inventions Exhibition opened at South Kensington.
May 18. Revised Version of the Bible published.
May 22. Death of Victor Hugo.
June 12. Mr. Gladstone resigned the Premiership of England.
June 15. Lord Salisbury appointed Prime Minister.
Death of Prince Frederick Charles of Prussia.

July 23. Death of General Ulysses S. Grant.
August 14. One of the Caroline Islands occupied by Germany.
September 5. Severn tunnel completed.
September 14. International yacht race off New York won by the American yacht, *Puritan*.
September 18. Union of Eastern Rumelia to Bulgaria proclaimed.
November 5. Conference in Constantinople on the Eastern question.
November 13. War declared between Servia and Bulgaria.
December 28. M. Grévy re-elected President of the French Republic.

1886

January 1. The annexation of Upper Burma by Great Britain.
January 20. Mersey tunnel opened by the Prince of Wales.
March 3. Peace negotiated between Servia and Bulgaria.
May 4. Colonial and Indian Exhibition opened by Queen Victoria.
May 4–5. Socialist riots at Chicago and Milwaukee.
May 8. European blockade of Greek ports.
June 6. Serious riots in Belfast.
July 21. Gladstone Cabinet resigned.
July 24. British Convention with China.

1887

January 21. Henry M. Stanley left London to relieve Emin Pasha.
January 29. Serious riots occurred at Belfast.
February 16. Queen Victoria's Jubilee celebrated in India.
February 22. Earthquake on the Riviera caused the loss of many lives.
May 4. Jubilee Exhibition at Manchester opened by the Prince and Princess of Wales.
June 3. Inaugural stone of the North Sea and Baltic Canal laid by the German Emperor.
June 20. Fiftieth anniversary of Queen Victoria's accession to the throne.
June 21. General celebration of the Queen's Jubilee.
East Zululand annexed by Great Britain.
July 4. First stone of the Imperial Institute laid by Queen Victoria.
July 13. Death of Herr Krupp.
September 15–17. Centenary of the United States Constitution celebrated.
October 24. Anglo-French Convention neutralizing the Suez Canal.

April 20. Andrew Carnegie gave $1,500,000 to the Netherlands to erect a Temple of Peace for The Hague Court of Arbitration.

April 23. Andrew Carnegie gave $600,000 to the Tuskegee Institute, Alabama.

April 30. The Louisiana Purchase Exposition buildings at St. Louis were dedicated with imposing ceremonies.

May 1. Turkish troops captured a band of 300 Bulgarians near Nevrokop, European Turkey.

May 6. The Porte addressed a note to the Bulgarian Government, holding it responsible for the outrages committed in Macedonia.

May 8. The Russians reoccupied the Province of Newchwang, Manchuria, with a large force of troops.

May 11. The Turkish Government disavowed responsibility for the massacre at Monastir.

May 12. Death of Richard Henry Stoddart, poet and essayist.

May 30. Heavy rains in Kansas and sudden flood at Topeka caused loss of 33 lives, great destruction of property and rendered about 10,000 persons temporarily homeless.

June 1. A tornado at Gainesville, Georgia, caused the loss of 100 lives and $500,000 in property.

June 6. A cloudburst at Clifton, South Carolina, caused a loss of 50 lives and property damage to manufacturing villages of $3,500,000.

June 11. King Alexander and Queen Draga of Servia were assassinated at Belgrade.

June 14. As result of a cloudburst at Heppner, Oregon, 250 people lost their lives and $1,000,000 worth of property destroyed.

June 18. Thousands of acres of Louisiana cotton land flooded and thousands of persons made destitute by the breaking of a levee.

June 25. Peter Karageorgevitch, who was proclaimed King of Servia by the conspirators on the death of King Alexander, took the oath of office as King Peter I.

June 30. Explosion in a coal mine near Hanna, Wyoming, caused the death of 200 people.

July 1. Bulgaria appealed to the Powers to compel Turkey to withdraw troops from the frontier.

July 2. Cuba signed treaties with the United States, ceding to the latter two naval stations, and disposing of the government of the Isles of Pines over which Cuba had sovereignty.

July 3. The Pacific cable completed at Honolulu.

July 4. Completion of Pacific cable. President Roosevelt sent the first message over it to Governor Taft, of the Philippines. The President sent another message around the world via cable, time being 12 minutes.

July 5. A flood at Jeannette, Pa., caused the loss of half a hundred lives and $1,500,000 worth of property.

July 16. Russia refused to receive or consider the Kishineff petition from America relative to the protection of the Jews.

July 20. Pope Leo XIII. died.

July 21. The House of Commons passed the Irish Land Bill by a vote of 317 to 20.

July 24. Serious decline of stocks took place in Wall Street; two failures were announced.

July 28. A Home Rule convention at Honolulu started a movement for Hawaiian independence.

August 4. Cardinal Giuseppe Sarto, Patriarch of Venice, chosen Pope to succeed Leo XIII. He assumed the title of Pius X.

August 9. Coronation of Pius X., as Pope, took place at the Vatican.

August 11. The Irish Land Bill passed the third reading in the House of Lords.

August 11–13. A West Indian hurricane destroyed $15,000,000 in values and many lives.

August 13. Bulgarian insurgents massacred inhabitants of the large Turkish village of Kenati.

August 15. Bulgaria sent a memorandum to the Powers detailing outrages committed by Turkey in Macedonia.

August 17. The Colombian Senate rejected the Panama Canal Treaty.

August 22. A yacht contest began for the America's Cup. This day the *Reliance* won the first race for the prize, outsailing the *Shamrock III.* by 7 minutes and 3 seconds. The second race, August 25, *Reliance* won by 1 minute and 19 seconds, and, in the third race, September 3, it was estimated the *Reliance* had a margin of 20 minutes over the *Shamrock.*

The Zionist Congress opened at Basle, Switzerland.

Death of Lord Salisbury, ex-Premier of England.

August 24. A wholesale massacre of the women and children in twenty-two villages in the districts of Folorina and Monastir, by the Turks.

Lou Dillon, a chestnut mare, trotted a mile in 2 minutes, beating the world's record up to that time.

The British Government, through the Zionist Congress, offered a colony in East Africa for settlement by the Jews.

August 25. The Russian Minister, Von Plehve, declared in a letter, before the Zionist Congress at Basle, that the Zionist movement could only be encouraged by the Russian Government on condition that the Jews were taken out of Russia.

August 26. The Zionist Congress at Basle voted to appoint a committee to investigate Great Britain's offer of land in East Africa for Jewish colonization.

September 1. The court for the arbitration of the Venezuelan preference cases opened at The Hague.

September 7–8. Appalling reports of bloodshed and outrage in the district of Kastoria and in the vilayet of Monastir, by the Turks.

September 9. Macedonian organizations of Sofia appealed to the Powers, in a report of Turkish atrocities, stating that 65,000 persons had been massacred and 120 villages burned.

September 12–13. Further authenticated reports of enormities by Bulgarian and Turkish troops, under orders, committed upon the Bulgarian Christian population of Okhrida and Leren districts to the extent of 60,000 victims; and the burning and plundering of villages and killing of peasants in the vilayet of Adrianople, instead of attempting to break up the insurgent bands.

September 13. Russia's new conditions relative to the evacuation of Manchuria construed as a postponement of the final date for one year.

September 14. Both Japan and England protested against Russia's new programme for the evacuation of Manchuria.

A delegate convention of Social Democrats held at Dresden.

September 17. Joseph Chamberlain, Charles T. Ritchie and Lord George Hamilton resigned from the British Ministry.

September 18. Advices from Sofia that Great Britain, France and Italy intervened to prevent the continuance of massacres in Macedonia.

September 21. A speed of 114 miles per hour was made on the Zossen electric line near Berlin.

One thousand Turks killed in a battle with the insurgents at Melink.

September 23. The International Peace Conference at Rouen, France, condemned the hostile acts of Great Britain and Germany during the Venezuelan incident, and praised the intervention of the United States.

September 24. The situation in Macedonia reported quiet. Russia issued a note of warning to Turkey and Bulgaria reiterating that no Power would aid either in the event of opposition to the Austro-Russian reform scheme.

September 25. The State of Minnesota filed a petition for an appeal in the Northern Securities Company case.

September 26–October 1. Chicago celebrated the hundredth anniversary of its first settlement.

September 29. A meeting in London urged the British Government to take action toward putting an end to Turkish rule in Macedonia.

September 30. Sir Michael Herbert, British Ambassador to the United States, died in Switzerland.

October 5. Alfred Lyttleton succeeded Joseph Chamberlain as Colonial Secretary in the British Cabinet.

October 6. An electric car on the Marienfelder-Zossen experimental line in Germany reached a speed of 125⅘ miles an hour.

October 7. The Servian National Assembly was opened by King Peter.

Japan's refusal of Russia's proposals for the partition of Korea announced.

October 16. The Russian squadron returned to Port Arthur.

Estimated number of fugitives from Macedonia in Bulgaria and Andrianople, 22,000.

October 17. The Alaskan Boundary Tribunal in London decided all points in favor of the United States except the Portland Canal, which was left in possession of Canada.

The Marconi system of wireless telegraphy between Peking and the coast put in service.

October 19. "Cresceus" trotted a mile in 1:59¾ at Wichita, Kansas, thus lowering the world's record one-fourth a second.

October 23. Lou Dillon again to the front beating all previous records at Memphis, Tennessee, by trotting a mile in 1:58½.

A speed of 130 miles an hour was reached on the electric experimental line near Berlin.

October 29. Russian troops entered Mukden, and reoccupied the guard houses.

November 1. The German historian, Mommsen, died.

November 3. Panama's independence of Colombia was proclaimed.

November 6. The United States Government recognized the independence of Panama and formally entered into relations with the new republic.

November 9. The provisional government of Panama appointed a commission to negotiate a canal treaty with the United States.

November 10. The New Republic of Panama was recognized by France.

November 11. Serious rioting occurred in Bogota when the news of the Panama revolt was received.

November 16. Colombia made formal protest against the action of the United States in regard to Panama.

November 18. Secretary Hay and M. Bunau-Varilla, the Minister from Panama, signed a new Isthmian Canal Treaty.

November 22. Peace negotiations were begun at Santo Domingo between the revolutionists and President Wos y Gil.

November 23. Germany recognized the Republic of Panama.

November 25. Turkey accepted the Austro-Russian plan of reforms in Macedonia.

November 26. United States Minister Powell announced the end of the revolution in Santo Domingo.

November 30. The United States Supreme Court declared the Kansas eight-hour law constitutional.

December 2. New Canal Treaty with the United States was ratified at Panama.

December 4. Negotiations were opened for the organization of an international administration for the preservation of order in the Balkans.

December 8. Russia replied to Japan's proposals in reference to the situation in the Far East; the reply was relative to Japan's predominance in Korea and Russia's special position in Manchuria.

Herbert Spencer died at Brighton, England. Body cremated at Hampstead, December 14.

December 15. Wages of 30,000 coke-workers were reduced 17 per cent, by the H. C. Frick Coke Company.

December 21. Japan delivered her reply to Russia; it asks for Russia to reconsider certain points in her answer to the Japanese proposals.

December 23. Reported that Japan would make no further concessions to Russia.

December 24. Great Britain formally acknowledged the Republic of Panama.

December 25. St. Petersburg officials declared that Russia would not make further concessions to Japan.

An arbitratrion convention between France and Italy was signed in Paris.

December 29. Dominican rebels attacked the provisional government forces in Santo Domingo.

December 30. The Panama Canal Company in Paris voted to continue the existing engagements with the United States.

Five hundred and ninety lives lost in a fire and stampede in the Iroquois Theatre, Chicago.

December 31. Efforts to fix the responsibility of the Iroquois Theatre disaster begun.

The expedition under Colonel Younghusband was on its way to Lhasa, the capital of Tibet. Colonel Younghusband, with an escort of 2,500 British soldiers, was sent by Lord Curzon, Viceroy and Governor-General of India, to make a treaty of commerce with the Grand Lama of Tibet, with orders to stay at Lhasa until the treaty was negotiated and as much longer as would be necessary to compel the Tibetans to respect its terms and carry out its stipulations.

1904

January 3. The Japanese press urged an immediate declaration of war.

January 5. Russian troops landed in Korea to protect interests there in conflicts between the Japanese and Koreans. United States marines were sent to Seoul.

January 6. Russia's reply to the Japanese note was received in Tokio but its nature was not disclosed.

January 9. The commercial treaties between China, and the United States and Japan were ratified at Peking.

January 11. A thousand of the Mad Mullah's men were killed by a British force in Somaliland.

January 13. Negotiations between Japan and Russia continued. Propositions from either not satisfactory to the other.

January 15. Russia requested Turkey to allow war-vessels to pass the Dardanelles.

January 17. The United States Department of Commerce and Labor reported that all records in the exportation of cotton were broken last year.

January 21. Tibet threatened to appeal to Russia for protection against the English invasion.

Petitions were sent to the Czar to submit the Far-East dispute to The Hague Tribunal.

January 22. Reported that 6,000 Russian troops entered Newchwang.

Moundsville, Alabama, destroyed by a tornado and 37 lives lost.

January 23. The town of Aalesund, in Norway, destroyed by fire; 8,000 rendered homeless.

January 24. Colonel Lynch, who fought with the Irish Brigade against English troops in South Africa, set at liberty by King Edward.

Servians and Montenegrins implicated in a plot to depose King Peter.

January 25. An explosion in a coal mine at Chiswick, Pa., killed 180 miners.

January 27. The Panama Constitutional convention adopted an article providing for intervention of the United States in domestic troubles on the Isthmus.

January 29. Tibet authorities demanded that the English armed expedition in that country be withdrawn.

January 30. The Trans-Siberian Railway closed to private merchandise to allow the transportation of troops and military stores.

January 31. United States Consul Skinner returned to Marseilles after visiting King Menelik of Abyssinia.

February 1. Secretary of War Elihu Root retired from the United States Cabinet and was succeeded by William H. Taft.

February 2. William C. Whitney died at New York.

February 6. Diplomatic relations between Japan and Russia broken off.

February 7. Russian and Japan Ministers and legation staffs ordered to leave Tokio and St. Petersburg without delay.

February 7–8. Great fire in Baltimore, causing an estimated loss in property of $50,000,000.

February 8. War between Japan and Russia began by the former's attack on the Russian fleet in the harbor of Port Arthur. (See RUSSO-JAPANESE WAR, in these Supplements.)

The United States invited England, Germany and France to suggest to Russia and Japan the localization and restriction of hostilities to a small area and the neutralization of China. A similar invitation was extended to Austria-Hungary, the Netherlands, Denmark, Spain and Belgium, February 11.

February 11. Admiral Alexieff appointed to the supreme command of the land and sea forces in the Far East, and war proclaimed with Japan.

The official proclamation of war with Russia, by the Mikado of Japan received.

The United States issued a proclamation of neutrality concerning the Russo-Japanese War.

February 13. China and Germany issued proclamations of neutrality.

February 15. Senator Marcus A. Hanna died in Washington.

February 22. The Japanese fleet under Vice-Admiral Togo attacked Port Arthur.

February 23. The United States Senate ratified the Panama Canal Treaty.

February 25. President Roosevelt signed the Panama Canal Treaty ratifications.

February 29. A lieutenant and six privates were wounded in an engagement with the Moros, under Hassan, in the Island of Jolo, P. I.

March 5. Field Marshal Count von Waldersee died at Hanover.

March 10. Casualties on the railroads of the United States reported for the year ending March 3, 1904, gave the record as follows: 427 passengers killed, 8,006 injured, 3,479 employes killed and 43,025 injured, making a grand total of 54,937.

March 13. Russian forces retreated from Korea; a large force concentrating at Liao-Yang in Manchuria.

March 19. The German forces in Southwest Africa were defeated in an engagement with the Hereros near Uwikokero.

March 20. Russia and Austria presented a note insisting that Turkey accept their scheme of reforms in Macedonia, and warning the Porte of the grave consequences that would follow further delay.

March 24. Sir Edwin Arnold, the famous poet, died in London.

March 28. The French Chamber of Deputies passed the bill forbidding teaching by religious orders.

Documents furnished by King Leopold, of Belgium, denied charges of cruelty to natives in the Congo Free State.

March 31. The Tibetans were repulsed by the British force under Colonel Younghusband.

The French courts dismissed Colombia's suit against the Panama Canal Company. The sovereignty of Panama over the canal zone was declared.

April 4. A Chinese general from Lhasa arrived at the British camp at Guru and requested the expedition to withdraw from Tibet.

April 7. An attempt was made upon the life of King Alfonso of Spain, by the explosion of a bomb, in Barcelonia.

April 9. Ex-Queen Isabella of Spain died in Paris.

April 11. German troops near Okahandja, in Southwest Africa, defeated 3,000 Hereros, after a fight of eight hours, losing four killed and eleven wounded.

April 14. The Korean imperial palace at Seoul was destroyed by fire.

April 19. Fire destroyed many buildings in the business section of Toronto. Estimated loss $13,000,000.

April 23. The shareholders of the Panama Canal Company ratified the sale of the property to the United States.

April 26. King Edward and Queen Alexandra received a warm welcome on landing at Kingstown to begin their tour of Ireland.

A British force bombarded the town of Illig, on the Somaliland coast, and captured its Sultan.

April 27. Norway, Sweden and Denmark reached an agreement regarding neutral regulations during the Russo-Japanese War.

April 30. The Louisiana Purchase Exposition at St. Louis was formally opened.

May 1–6. The Socialists (Social Democratic) National convention met in Chicago and nominated Eugene V. Debs, of Indiana, for President, and Benjamin Hanford, of New York for Vice-President.

May 2. Brazil granted tariff concessions to the United States on flour and various other articles.

May 3. Germany sent 1,500 reinforcements to fight the Hereros.

May 4. The gold-standard proposal was rejected by the Panama Assembly by a vote of 16 to 13.

May 6. Japanese forces landed at Pitsewo and Kinchow, on the Liao-tung Peninsula and cut railroad and telegraph communication with Port Arthur.

May 7. The Japanese captured Feng-Wang-Cheng, the Russians retreating without a battle.

May 9. Viceroy Alexieff established headquarters at Harbin.

May 10. Sir Henry M. Stanley, the African explorer, died in London.

May 12. The Tibetans bombarded the British camp at Gyantse. In Parliament it was announced that the mission must go to Lhasa unless the Tibetans would negotiate within a specified time.

May 14. Miss Clara Barton resigned the presidency of the American Red Cross and was succeeded by Mrs. John A. Logan.

May 18. The American Peace Society urged the United States to offer mediation to Japan and Russia.

May 19. Ion Perdicaris, a naturalized American citizen, and his stepson were kidnaped and held for ransom by brigands in Morocco. On the receipt of the news Washington authorities ordered a war-ship to Tangier.

May 27. General Oku with his Japanese forces drove the Russians from their supposedly impregnable position on Nan-Shan Hill, outside of Kin-Chow.

May 28. The Russians evacuated Dalny.

Senator Matthew S. Quay died at Beaver, Pa.

May 30. The Japanese, under General Oku, occupied Dalny.

May 31. Cossacks were forced by the Japanese to retire in a battle at Vagen-Fu-Chu, a railroad station south of Hai-Cheng.

France promised to use her good offices to effect the release of Perdicaris, the American held for ransom by Moorish brigands. Seven United States war-ships were at Tangier, Morocco.

June 1. The Japanese occupied Samaja.

June 2. France began negotiations for the release of Perdicaris.

June 4. Cossacks defeated the Japanese in a pass forty miles north of Feng-Wang-Cheng.

A tornado devastated several towns in Oklahoma.

June 5. Two regiments of artillery and engineers ordered to reinforce the British expedition in Tibet. Tibetans attacked the British at Kangma, leaving 170 dead on the field.

June 6. **Lawlessness in Colorado:**

Labor troubles in Cripple Creek mining district, Colorado, broke out with renewed violence. As the result of an explosion of an infernal machine which had previously been placed in position with malicious intent, the railroad station at Independence was wrecked and 13 men killed and several others seriously injured. The men killed were all non-union miners, except two. Suspicion for the crime was thus largely cast on union laborers, but without any real evidence, and the Western Federation of Miners at once passed a resolution condemning the act and offered a reward of $5,000 for the apprehension of the guilty party. That infamous deed was associated with the history of the strife occasioned by the strike which followed a fruitless effort to secure the demanded recognition of the union organization, under the Western Federation of Miners, in the ore reduction mills at Colorado City. This occurred in February, 1903, and in March of the same year, the Cripple Creek miners were called out to aid in enforcing the demand. Antagonism of interests, accompanied with sharp friction and some violence, continued until the following August when the strike embraced the mining districts of Cripple Creek, Victor and Independence, in Teller county, and later extended to Telluride in San Miguel county. In addition to these difficulties in the gold fields of Colorado, a strike was also in progress at Trinidad, a principal coal-mining center of Las Animas county in the southeastern part of the state. On the strength of an alleged "reign of terror" existing, Governor Peabody ordered troops to Teller county, September 4, 1903, and the 4th of the next December martial law was practically ordained in the district. In January, 1894, military law, by executive sanction, superseded civil action in the Telluride region. The Trinidad coal district had also been subjected to military rule. The arrests, imprisonment, deportations, violence, charges and counter-charges of criminal

June 6—Continued:

actions, which prevailed at different periods during the clash, suddenly assumed an acute stage on the blowing up of the Independence depot. Coupled with the grievances aggravating this factional conflict, in its course, was the charge against mine owners of bribing legislative and executive officers. Whether this allegation had any foundation, it was at least contended that a plain dereliction of duty by the legislative representatives of the people had been established, and that this failure to obey the positive mandate of constituents was not less culpable than the violation of civil law charged against the miners and had an indirect or reflex influence in provoking many of the atrocities growing out of the strikes. This phase of the subject is associated in events with the previous agitation for the establishment of an eight-hour day by legislation, its enactment and the subsequent proceedings. Many of the mines had been worked by eight-hour shifts, but a number of the operators, even of these mines, manifested an antipathy toward the law, while others ignored it, and, after passing through various vicissitudes relative to its application, it was carried to the supreme court of the state and on certain technicalities declared unconstitutional and void. The advocates of an eight-hour day then formulated a constitutional amendment requiring the legislature to enact a law establishing eight hours as a legal work day in mines, smelters and other branches of industry named, also for any occupations the general assembly might consider injurious or dangerous to health, life or limb. This amendment was placed before the people of the state for their verdict in May, 1902, and was carried by a vote of 72,980 to 26,266. The following legislature, which met in the winter of 1903, whose duty it was to pass an enabling act to put in force the provisions of the amendment, then a part of the constitution, failed to do so, and after its adjournment Governor Peabody refused to call an extra session of the legislature to have the appropriate legislation enacted. The whole question was thus judged from different standpoints, alternating between and including right and wrong, and embodying both law makers and law breakers in a strange tangle of offenses.

In a riot at Victor, Colorado, growing out of the disturbed conditions, two men were killed and eight wounded.

June 7. The Cripple Creek district controlled by a combination of militia, vigilance committees, and a sheriff's posse.

June 8. Six of the striking miners in the Cripple Creek district of Colorado killed by the militia and 15 prisoners taken.

June 9. The Citizens' Alliance of Cripple Creek started a boycott against all unions, and General Bell, commander of the militia, ordered a mine closed for employing union men.

June 10. The Western Federation of Miners appealed to President Roosevelt to investigate the mining conditions in Colorado.

June 11. Early Grey was appointed to succeed Lord Minto as Governor-General of Canada.

June 12. Manuel Quintana elected President of Argentina, and José Pardo, President of Peru.

June 13. The Council of the Russian Empire approved the bill repealing the law which forbade the Jews living within thirty miles of the Russian frontier.

June 14. King Victor Emanuel, of Italy, decided in favor of Great Britain in the Anglo-Brazilian dispute, over the Guiana frontier.

June 15. **Steamboat Horror:**

The steamer *General Slocum*, carrying a Sunday-school excursion of St. Mark's German Lutheran Church, New York City, with a party on board numbering 1,374, mostly women and children, caught fire while passing through that part of the East River known as Hell Gate, within the New York City limits. It was flood tide, the eddies and currents in the waters were strong and the captain, erring in judgment, it was alleged, made no attempt to land on either shore or beach his boat, but headed for an island two miles up stream with his human freight, hoping to save it. As the boat went forward at full steam the fore-and-aft draft fanned the flames and hastened its destruction. On realization of the terrible situation, the wildest panic seized the passengers; the life preservers of the *Slocum* were found worthless and the life boats were not utilized by the crew, they being engaged in futile efforts to stay the flames. In about twenty minutes from the discovery of the fire the boat was destroyed and of the men, women and children on board, 958 went down to their deaths by fire or water. In some cases whole families were wiped out.

June 16. General Count Bobrikoff, Governor-General of Finland, was shot and mortally wounded at the entrance to the Finnish Senate at Helsingfors.

June 17. President Roosevelt ordered a rigid investigation of the disaster on the *General Slocum*.

June 18. Japan's second issue of exchequer bonds was more than three times oversubscribed.

June 21. President Roosevelt named a commission to investigate the *Slocum* disaster at New York.

June 22. Constant skirmishes occurring between Kuroki's advancing army and the Russian rear guard.

June 23. Marshal Oyama appointed to take command of the Japanese armies in Manchuria.

The Republican National Convention at Chicago nominated Theodore Roosevelt, of New York, for President, and Charles W. Fairbanks, of Indiana, for Vice-President.

June 24. President Roosevelt appointed William H. Moody, then Secretary of the Navy, Attorney-General; Paul Morton, of Illinois, Secretary of the Navy, and Victor H. Metcalf, of California, Secretary of Commerce and Labor.

June 27. Germany sent a war-ship to Haiti to demand redress for the stoning of her minister.

June 28. United States Ambassador Porter presented a formal note of thanks to France for aid in securing the release of Perdicaris.

Nearly 600 emigrants, by the wreck of the Scandinavian-American steamer *Norge*, which ran on a rock west of Hebrides, were drowned. There was a total of 774 persons on board. The appalling disaster occurred at 7 o'clock in the morning.

June 29. The Tibetans asked for a truce, pending the arrival of officials from Lhasa, to confer with the British expedition.

June 30. Two hundred persons killed by a tornado at Moscow.

The Prohibition National Convention at Indianapolis nominated Dr. Silas C. Swallow, of Pennsylvania, for President, and George W. Carroll, for Vice-President.

July 1. Messrs. Morton and Metcalf succeeded Secretaries Moody and Cortelyou, respectively, while Mr. Moody became Attorney-General and Mr. Knox retired from the Cabinet, to enter the United States Senate from Pennsylvania, being appointed to fill the unexpired term of Matthew S. Quay by Governor Pennypacker.

A census bulletin shows the negro population of the United States to be 9,204,531.

July 3. The eleventh National Convention of the Socialist-Labor party, composed of 38 delegates, representing 18 states, assembled in Grand Central Palace, New York City. On the fourth day of the convention, Charles H. Corregan, of New York, was nominated for President, and William W. Cox, of Illinois, for Vice-President.

July 4. The centennial anniversary of the birth of Nathaniel Hawthorne observed at Concord, Mass.

As a result of celebrations throughout the country 52 persons were killed and 3,049 injured.

July 5. A thousand Achinese—men, women and children—reported to have been slaughtered by Dutch troops.

The Populist National Convention at Springfield, Ill., nominated Thomas E. Watson, of Georgia, for President, and Thomas H. Tibbles, of Nebraska, for Vice-President.

The Czar appointed Prince John Obolensky Governor-General of Finland, to succeed General Bobrikoff, and issued a rescript stating that the province must resign itself to Russian domination.

July 6. A British force, of the Colonel Younghusband expedition, captured the Tibetan fort at Gyangtse.

The Democratic National Convention met at St. Louis.

The fiftieth anniversary of the birth of the Republican party was celebrated at Jackson, Michigan.

July 7. As a result of inquiries by the United States as to British plans in Tibet, it was learned that the British Government was ready to withdraw its expedition as soon as certain promises were made by the Tibetans.

July 8. Haiti declined to negotiate a trade treaty with Germany.

July 9. Judge Alton B. Parker, of New York, was nominated for President by the Democrats at St. Louis, and ex-Senator Henry G. Davis, of West Virginia, was nominated for Vice-President the next day.

July 10. Fifteen persons killed and 50 injured in wreck on the Erie railroad at Midvale, New Jersey.

July 12. Fifty thousand meat packers throughout the country went on a strike. The principal centers affected were Chicago, Kansas City, St. Joseph, East St. Louis and Omaha. Orders for the strike were issued from the headquarters of the union at Chicago. Cause of strike was wage-reductions affecting unskilled laborers.

July 13. A cloudburst near Manila, P. I., killed 200 persons and damaged property to the amount of $2,000.000.

Twenty persons were killed and 25 injured in a collision on the Chicago and Eastern Illinois railroad, near Chicago.

July 14. Paul Kruger, ex-President of the Transvaal Republic, died at Clarens, Switzerland.

July 25. A strike of about 30,000 operatives closed eighty-one mills, temporarily in Fall River, Massachusetts.

July 28. M. Plehve, Russian Minister of the Interior, was assassinated in St. Petersburg, by the explosion of a bomb.

Russia promised England to make reparation for the capture of merchant vessels.

A Japanese administrator assumed control of Newchwang.

August 1. Lieutenant-General Count Keller was killed by a Japanese shell at Yang-tse Pass, 30 miles east of Liao-Yang.

Labor Commissioner Wright reported that while labor-wages increased 16.6 per cent. since 1896, the cost of living increased 15.5 per cent.

August 6. Advance of all the Japanese columns on General Kuropatkin's forces was reported.

August 7. British troops entered the Tibetan city, Lhasa.

The Dalai Lama fled to a monastery eighteen miles away.

August 8. Seventy-six persons were killed and many others injured in a train wreck caused by the collapse of a bridge at Dry Creek, near Pueblo, Colorado, on the Denver & Rio Grande railroad.

August 10. Death of M. Waldeck Rousseau, ex-Premier of France.

August 16. A mob at Statesboro, Georgia, burned two negroes at the stake, after they had been convicted of murder and sentenced to death.

August 20. Renewal of excitement in Cripple Creek, Colorado, in consequence of the late troubles in that section. A number of deportations took place, among them union miners, also a number of prominent citizens reported as not in sympathy with the "Citizens Alliance."

May wheat went up to $1.16¼ on the Chicago market.

August 25. Writs were issued for the arrest of 28 citizens of Cripple Creek, Colorado, for their participation in the deporting of union men and sympathizers.

August 29. A hundred persons were killed in a fire that destroyed the city of Binang in the Philippines.

September 4. The Japanese occupied Liao-Yang on the retreat of the Russians after the famous battle.

September 7. Typesetting machines were put in operation in the United States Government printing office.

September 9. Colonel Younghusband and the Tibetan officials signed a treaty at Lhasa.

September 11. Anti-Jewish riots occurred at Rovno and Smela, in Russia. Many persons were wounded and houses and shops pillaged.

September 14. Turkish militia battalions were called out to suppress an Albanian outbreak.

Anarchist plots were discovered in Barcelona and Madrid, Spain.

September 20. Russia expressed disapprobation of the Anglo-Tibetan Treaty.

September 21. King Peter of Servia was crowned at Belgrade.

September 23. Mount Vesuvius discharged an immense stream of lava accompanied by columns of red-hot ashes.

September 24. Sixty persons were killed and about 120 injured in a head-on collision on the Southern railway, near Knoxville, Tennessee.

September 27. The conductor, engineer and brakeman of the freight-train, which collided with a Sunday-school excursion-train near Chicago, July 13, causing the death of 18 persons, were indicted for manslaughter.

September 29. Senator George F. Hoar died at Worcester, Massachusetts.

September 30. Fighting in the vicinity of Mukden and Yentai was reported. The Russian War Office in compiling statistics of Japanese losses, estimated the latter at Port Arthur, during the siege, at 45,000 killed and disabled.

October 1. Death of Sir William Vernon Harcourt, an eminent English statesman.

October 3. The thirteenth international peace conference opened in Boston.

October 4. Postmaster Henry C. Payne died at Washington.

October 5. The peace congress at Boston adopted resolutions calling upon Japan and Russia to end the war and upon The Hague agreement signatories to open a way for peace.

October 6. The Interstate Commerce Commission reported that 9,984 lives were lost in the United States last year by accidents on railroads.

October 8. Record of fatalities in the United States from automobile accidents, since January 1, 1904, were 36, and many times that number were reported injured. In Chicago, three were killed and 80 injured by the same agency.

October 10. Thirty-one persons were killed and 56 injured in a wreck of the Missouri Pacific railroad near Warrensburg, Mo.

Assistant Postmaster Robert J. Wynne appointed Postmaster-General.

October 11. The artillery fighting between the Russians and Japanese, six miles north of Yentai, between Mukden and Liao-Yang, was said to be terrific.

Santa Fe, a small Missouri village, almost totally destroyed by fire.

October 12. Governor Bates, of Massachusetts, appointed former Governor W. Murray Crane to succeed the late George F. Hoar in the United States Senate.

October 13. James Callahan, an Iowa millionaire, bequeathed $100,000 to Booker T. Washington to aid the cause of negro education.

German Government called for volunteer troops to be sent to southwest Africa.

October 14. King George of Saxony died at Dresden.

About 250 houses were wrecked by a hurricane in the town of San Blas, Mexico.

Famine was reported in the province of Gotteburg-Bohus, western Sweden, as a result of crop failure.

October 16. The report of the *Slocum* investigating committee appointed by President Roosevelt to report on the steamboat disaster recommended the dismissal of a number of federal officials, censured the steamboat company, and called for congressional action to make passenger steamers safe. The President in concurrence with the report dismissed three of the inspectors of the port of New York.

October 18. Great Britain decided to retain hold on Tibet by occupying Chumbi Valley, the key to the country, until the entire amount of indemnity demanded, $3,750,000, should be paid.

October 22. The Japanese Field-Marshal Oyama estimated the Russian loss in the Shakhe River conflict at 60,000—12,000 killed and 48,000 wounded.

The Russian Pacific fleet—the Baltic squadron—on its way from Cronstadt to Port Arthur, came into contact with a British fishing fleet from Hull, a seaport of Yorkshire, England, while in the North Sea, and fired upon the vessels, killing the captain and mate of the steamer *Crane* and wounding others on board. An explanation of the assault given was that the fishing fleet was mistaken for Japanese vessels, which Vice-Admiral Rojestvensky, commander of the Russian armada, expected to encounter sometime during his voyage.

October 24. The armored cruiser *Colorado* broke all speed records for ships of her class in the American navy, by averaging 22.26 knots an hour, over a course of eighty-eight miles during her trial trip.

October 25. Message of the Czar to King Edward expressed regret for the action of the Baltic fleet in the North Sea, for firing on the fishing trawlers, implying a compliance with Great Britain's demands for reparation.

A vigorous British protest was received in St. Petersburg relative to the attack on the North Sea fishermen.

An airship constructed by Captain Baldwin, of California, made a journey of ten miles over St. Louis and the World's Fair.

October 27. The great subway railroad in New York City was opened for passenger traffic. The tunnel had been in course of construction since March 26, 1900. The system covers 24 miles. There are 13½ miles of subway proper, 5½ of elevated viaducts and 5 miles of deep tunnels. Cost, $35,000,000.

October 28. Explosion in a mine near Trinidad, Colorado, killed between 30 and 60 miners.

October 29. Great Britain and Russia decided to refer the North Sea dispute to an international tribunal under the rules of The Hague convention; the ships of the Baltic fleet to be held at Vigo, Spain, pending the decision.

October 30. Secretary of State Hay, acting under instructions of President Roosevelt, the latter's advice being in conformance with request of the interparliamentary union, issued an invitation to the Powers to meet by their representatives in a second peace conference at The Hague.

November 1. The open trial of those alleged to be responsible for the anti-Jewish riots of last September was hailed by the Russian press as the beginning of a new era.

November 2. An arbitration treaty between United States and France was signed by Secretary Hay and Ambassador Jusserand.

November 5. Official reports published in Tokio covering the Port Arthur attack from October 30 to Nov. 3 stated that the Japanese had made a number of distinct gains, materially shortening the defensive power of the garrison.

The reported revenue to be received by the railroads for transporting the crops grown in the United States during 1904 was estimated at $463,644,051.

November 7. A fleet of five air-ships began to make trial flights at the World's Fair, St. Louis, for a prize of $100,000.

November 8. Theodore Roosevelt and Charles W. Fairbanks were elected President and Vice-President respectively of the United States.

Cook county, Illinois, adopted the Torrens system of recording land titles, the vote in both the city and country districts being in favor of the proposition.

President Roosevelt issued a formal statement that he would not be a candidate for re-election.

November 16. A treaty of arbitration between Great Britain and Portugal was signed at Windsor Castle.

November 19. The statue of Frederick the Great, given to the United States by Emperor William II., was unveiled in Washington, D. C., with imposing ceremonies.

Italy agreed to take part in The Hague Peace Conference proposed by President Roosevelt and directed its Ambassador at Washington to sign an arbitration treaty with the United States.

November 21. News from Berlin stated that Germany was pleased with President Roosevelt's speech at the unveiling of the statue of Frederick the Great.

Representatives of the Russian Zemstvos adopted a declaration in favor of the election of a body to frame the laws of the empire and urge a general amnesty for political prisoners.

Estimated expenses of the Navy Department for the coming year were $114,530,638.

November 22. An arbitration treaty between the United States and Germany was signed by Secretary Hay and Baron von Sternberg in Washington.

November 23. An arbitration treaty between the United States and Portugal was signed in Washington.

November 26. Germany and France accepted President Roosevelt's proposal for a second peace conference at The Hague.

Commissioner Garfield, of the Department of Commerce, ordered an investigation of the Standard Oil Company.

November 27. Leading Russian statesmen declared that Russia would not hasten to make a radical change in government and that all reform proposals must await the end of the war.

One man was killed and several others seriously injured by an explosion in the Consolidated Gas Company plant, New York City.

November 29. The German Reichstag opened with a programme vital to the nation's interests including commercial treaties.

New York Court of Appeals declared the labor law unconstitutional which prohibits a contractor from employing his men more than eight hours a day on city, county or state work.

Decision of Attorney-General Moody announced by which all "guessing" contests are classed as lotteries, and publications containing them to be barred from the mails after January 1, 1905.

November 30. Japanese captured 203-Meter Hill at Port Arthur, after a desperate battle on the summit which lasted all day.

The Japanese cruiser *Saiyen* was sunk by a Russian mine off Port Arthur.

December 1. Louisiana Purchase Exposition closed with a record of over 200,000 admissions. Total admissions during the fair were reported to have been 18,500,000, and total estimated cost $50,000,000, in round numbers.

The report of casualties during the deer-hunting season in Wisconsin and Northern Michigan was that 42 hunters were killed and 20 wounded.

Russia declined to join in a second peace conference at The Hague until the end of the war.

December 2. The Reichstag adopted a resolution asking the government to introduce a bill for the protection of the middle commercial classes against great accumulations of capital in the retail trade.

Russia expressed the hopelessness of holding Port Arthur if the Japanese under General Nogi could mount guns on 203-Meter Hill.

Mrs. G. H. Gilbert, the aged actress, died in Chicago, while in the midst of a farewell tour, in the comedy "Granny," written especially for her by Clyde Fitch. She was 83 years of age.

December 3. General Nelson A. Miles accepted the appointment as Adjutant-General on the staff of Governor-elect William L. Douglas of Massachusetts.

Much suffering reported in Ireland from famine as a result of the potato crop failure.

December 4. John Harrison Wagner, author and newspaper writer and an Australian by birth, committed suicide in New York City.

December 5. Third session of 58th U. S. Congress opened in Washington.

Secretary Shaw submitted to Congress estimates aggregating $619,669,852 for appropriations for the fiscal year ending June 30, 1906.

Under the deadly fire of the Japanese naval guns mounted on 203-Meter Hill almost the entire Russian squadron at Port Arthur was destroyed.

December 8. The Japanese legation informed Secretary of State Hay that the invitation of President Roosevelt to a second Hague conference had been gladly accepted by the Tokio government.

The fiftieth anniversary of the proclamation of the dogma of the Immaculate Conception was celebrated in Rome, with great splendor.

December 10. Representative Bartholdt, of Missouri, president of the Interparliamentary Union called on Secretary Hay urging that President Roosevelt take the initiative in moving for peace in the Far East.

December 11. Pope Pius X. amid impressive ceremonies canonized two new saints in St. Peter's in Rome. It was the second canonization held since 1870.

December 12. An analysis of the last presidential vote reported shows that while Roosevelt had a record popular majority of 2,526,470, the total vote for all candidates was 13,513,820 which was 455,233 less than in 1900 and that Parker ran 1,293,053 behind Bryan.

President Roosevelt named Charles P. Neill, of the District of Columbia, for Commissioner of Labor, vice Carroll D. Wright resigned.

December 13. Sasoneff, who threw the bomb that killed Minister of the Interior von Plehve, of Russia, July 28, 1904, and Sikorifsky, his accomplice, were found guilty by the Court of Appeals. The former was sentenced to imprisonment for life, with hard labor, and the latter to 20 years' imprisonment.

December 15. August Belmont chosen President of the National Civic Federation to succeed the late Marcus A. Hanna.

Statistics show that between January 1, 1902, and June 30, 1904,—two and a half years—violence in labor conflicts resulted in 180 deaths, 1,651 personal injuries, and 5,533 arrests.

December 16. Eva Booth, the new American commander of the Salvation Army, arrived from England, and began her work in Chicago.

Secretary Hay sent to the Powers the replies of the various governments to the Peace Congress invitations.

A meeting of representative and leading citizens held in New York, under the auspices of the Civil Federation, began a movement for international arbitration, to be followed by agitation in the principal cities of the country.

Funeral of former President Kruger, of the Transvaal, was held in Pretoria, South Africa. Boers and Britons joined in honoring the dead leader.

December 19. King Alfonso signed a decree authorizing Senor Ojeda, the Spanish minister at Washington, to sign the arbitration treaty with America.

December 22. The Czar of Russia penned a rebuke to the Zemstvos for their insistence upon a constitutional convention.

December 24. The Japanese won north defense on Keekwan Mountain, near Port Arthur.

December 25. Baldwin air-ship, *California Arrow*, was given a successful trial at Los Angeles, sailing against a twelve-mile breeze, and responding readily to the operator's movements. Time of flight, one hour and thirteen minutes, and distance covered, about twenty miles.

December 26. Emperor Nicholas, (Czar of Russia), issued a ukase to conciliate the Zemstvos, promising the fullest possible measure of self-government, justice to all and liberty of the press.

December 27. By a vote of the people in Minnesota the grand jury system of that state was abolished.

December 31. New York during 1904 had 331 homicides, out of which 61 indictments were returned.

According to statistics reported, fewer lynchings occurred in the United States during 1904 than in any year since 1885. They numbered 87. There were 104 in 1903, 96 in 1902, and 135 in 1901. November, 1904, was the one month in twenty years during which no crime of this kind was reported, north or south.

1905

January 1. The fall of Port Arthur. General Stoessel, the Russian commander of the forces in Port Arthur, sent word to General Nogi, commander of the besieging Japanese army, that he would capitulate.

January 2. Terms of surrender of the Port Arthur garrison were agreed upon by the plenipotentiaries of both parties, and the Japanese at once arranged to occupy the citadel.

January 4. Theodore Thomas, famous musician and orchestra conductor, died in Chicago.

January 5. The Forest Congress in session at Washington was addressed by President Roosevelt on the necessity of preserving the timber.

January 8. General Nogi reported the total number of prisoners taken at Port Arthur as 878 officers and 23,491 men.

January 10. The treaty of peace between Chile and Bolivia was signed.

January 11. The emperors of Russia and Japan granted the Kaiser's request that he be permitted to confer decorations on Generals Nogi and Stoessel.

January 17. Kashgar, a city of 50,000 inhabitants, was occupied by Russian troops.

January 18. The general strike in northern Russia began to grow rapidly and take on revolutionary tendencies.

January 19. Emperor Nicholas, of Russia, and family, had a narrow escape from death at the winter palace in St. Petersburg. Either by plot or accident, a charge of grape was fired into the mansion as a salute on the occasion of the solemn religious rite of blessing the waters, which wrecked portions of the palace.

January 22. A general uprising of strikers and others favoring constitutional government in Russia, led to rioting in the streets of St. Petersburg. The military fired on the mob, killing and wounding many men, women and children.

Senator Linden was appointed Secretary of State for Finland.

January 24. Russian strike and revolt spread to Moscow and other industrial centers.

January 27. Largest diamond ever discovered found near Pretoria in the Transvaal. Minimum estimated value, $3,500,000.

January 30. Continuous fighting between rioters and troops in Moscow, and hungry mobs besieged the bakeries. One hundred and sixty persons reported killed or wounded.

January 31. The retirement of Interior Minister Sviatopolk-Mirsky, of Russia, was officially announced.

February 5. Death of General Matsumara, leader of the Japanese forces at 203-Meter Hill, was reported to have been caused by congestion of the brain.

February 6. Soisalon Soininen, procurator-general of Finland, was assassinated at his residence by a young man of unknown identity.

February 7. The United States Senate adopted that part of the House bill making Oklahoma and Indian territories one state under the name of Oklahoma, but amended the provision similarly uniting New Mexico and Arizona. The House not concurring in the amendment, the measure failed to become a law.

February 8. Oscar II, King of Sweden and Norway, on account of ill health, surrendered his sceptre of authority to his son, Prince Gustaf.

Official canvass of the Presidential vote of both Houses in joint session, announced 336 electoral votes for Roosevelt and Fairbanks, and 140 for Parker and Davis.

February 10. Strikers and troops engaged in conflicts in Lodz, Russian Poland. Over 30 strikers were killed and nearly 200 wounded.

February 14. King Edward opened the sixth session of the first Parliament of his reign.

February 16. President Roosevelt instructed the Department of Commerce and Labor to make a rigid and searching inquiry into the methods of the Standard Oil Company.

February 17. Grand Duke Sergius, of Russia, uncle of the Czar, was assassinated by a bomb being thrown under his carriage while driving within the ramparts of the Kremlin, in Moscow, from the Little Palace to another government building.

Statue of Frances Willard was unveiled in the American Temple of Fame in the Washington capitol.

February 20. Mine explosion at Virginia City, Ala., entombed 160 men. There was an almost total loss of life of the imprisoned miners before they could be released.

February 25. North Sea Commission in Paris decided that Admiral Rojestvensky's Baltic fleet was not justified in firing on the Hull trawlers, and that there were no hostile torpedo boats about at the time.

February 27. Ex-United States Senator Geo. S. Boutwell died at Boston, aged 87.

March 4. Theodore Roosevelt and Charles W. Fairbanks inaugurated President and Vice-President, respectively, of the United States.

March 7. George B. Cortelyou took up his duties as Postmaster-General.

March 10. The occupation of Mukden by the Japanese; the culmination of a series of triumphs over the Russians in one of the greatest battles ever fought, lasting 18 days and engaging over 800,000 men.

March 14. Nineteen persons burned to death, 40 injured, some fatally, and 200 rendered homeless by a tenement fire in New York.

March 16. The Gubernatorial contest in Colorado was decided by the Legislature voting to unseat Governor Alva Adams (Dem.) and seat James H. Peabody (Rep.), by a vote of 51 to 41. The contest was based on alleged frauds in the preceding November election. According to the canvass of the election returns by the general assembly, Adams was elected by 9,744 votes over his competitor, and was inaugurated governor. Those who challenged the validity of the election, however, claimed that the elimination of fraudulent votes would give the office to Peabody. By a ruling of the State Supreme Court the Legislature was authorized to decide the contest. This body had a large Republican majority, but 22 members of the dominant party, holding the balance of power, refused to vote for replacing Adams with Peabody, except on the express stipulation that the latter on being seated would at once resign, thus devolving the functions of the office on the Lieutenant-Governor, Jesse F. McDonald (Rep.), for the unexpired term. This agreement being made, the vote resulted as stated, and the Governor's chair was successively filled in 1905 as follows: James H. Peabody, expiring term, to January 10; Alva Adams, January 10 to March 16; James H. Peabody, March 16 to 17; Jesse F. McDonald, March 17 ——.

March 17. General Kuropatkin was succeeded in supreme command of the Russian army, in Manchuria, by General Linevitch.

March 18. Major William Warner, of Kansas City, elected United States Senator from Missouri to succeed Francis M. Cockrell. The balloting in the Missouri Legislature for a United States Senator began January 18 and continued in a deadlock to March 18.

March 19. Fourteen members of a heroic rescuing party entered mines near Thurmond, West Virginia, to regain the bodies of 10 comrades killed in an explosion, and before they had fulfilled their mission, lost their lives in a second terrific explosion.

March 21. General Kuropatkin, after having been superseded by General Linevitch, agreed to take a minor position under the latter, and was given command of First Army in Manchuria by the approval of the Emperor of Russia.

March 24. Jules Verne, the famous French author, died at Amiens, France, age 77.

March 25. Death of Maurice Barrymore, the noted actor, in a sanitarium at Long Island.

A tentative agreement, by which the revenues of Santo Domingo are to be collected by a commissioner appointed by President Roosevelt, was effected between United States Minister Dawson and the Morales government.

March 27. Mrs. Cassie L. Chadwick, the notorious borrower on false securities and bank swindler, was sentenced, by the United States District Court at Cleveland, to 10 years in the penitentiary.

March 29. Russian officers reported that the value of the supplies abandoned and burned at Mukden was $1,750,000.

March 30. The new Japanese bonds sold readily in the money centers of America and Europe.

March 31. President Roosevelt, after consultation with representatives of Japan and Russia, decided that his efforts as peace mediator would not be effective.

April 3. A powder explosion and afterdamp in the Joseph Leiter coal mine at Zeigler, Ill., caused the death of 43 miners.

April 4. Judge Edward F. Dunne, Democratic nominee for mayor of Chicago, was elected by a plurality of 24,248.

April 8. Baron Kaneto, of Japan, in an address before the Academy of Political and Social Science, declared the war in the Far East to be one for the "open door."

April 14. Body of John Paul Jones, founder of the American navy, found in Paris after a search of five years, conducted by Ambassador Porter.

April 18. Kaleieff, who killed Grand Duke Sergius, of Russia, was condemned to death, after a brief trial, at Moscow.

April 21. Death of United States Senator Orville H. Platt at his home in Washington, Connecticut.

Eleven thousand nine hundred and fifty-five immigrants landed at Ellis Island, the New York immigrant station, the greatest number of arrivals ever known before in a single day.

April 23. Joseph Jefferson, the eminent actor, passed away.

April 25. The new Transvaal constitution promulgated gives the Burghers the right to vote.

April 28. Major-General Fitzhugh Lee died at Washington, D.C.

May 1. Mexico, according to previous decree, went on a gold basis.

May 5. Opinion rendered by Attorney-General Moody that Congress has full power to regulate railroad rates, and may delegate it to a commission.

May 9. Memorial exercises on the one-hundredth anniversary of the death of the famous German poet and dramatist Friedrich von Schiller, were held in various cities of the United States.

The estimate of Mr. North, the director of the census, for the United States on that date, was 82,518,020.

May 10. On his stop-off at Chicago, President Roosevelt was royally entertained by the Iroquois Club, the leading Democratic organization of Illinois.

A tornado at Snyder, Okla., killed about 100 and injured 150 other persons, and destroyed nearly every building in the town of 1,000 inhabitants.

May 11. An express train on the Pennsylvania railroad carrying passengers, dashed into two freight cars loaded with dynamite, in South Harrisburg, Pa., causing an explosion, and resulting in the death of 21 persons and the serious injury of 44 others.

May 19. Emperor Nicholas, of Russia, signalized his birthday by signing a manifesto for the convocation of the Zemsky Sobor, or council of the people, October 17, 1905.

May 24. William Ziegler, the baking-powder millionaire and patron of polar expeditions, died at Great Island, Conn.

May 26. Baron Alphonse Rothschild, head of the Rothschild's Paris branch bank, died at Paris.

May 27–29. Great sea battle between Russia and Japan, and the latter's signal victory in the Straits of Korea. See RUSSO-JAPANESE WAR, Vol. XXVIII.

May 31. Secretary of the Navy Paul Morton made known his intentions of leaving the President's Cabinet July 1st. This was followed by President Roosevelt's announcement the same day that he had decided upon Charles J. Bonaparte, of Baltimore, for Mr. Morton's successor.

June 1. Lewis and Clark Exposition opened at Portland, Oregon.

An attempt was made to assassinate King Alfonso, of Spain, and President Loubet, of France, by a bomb aimed at the carriage in which they were riding on the streets of Paris.

June 2. President Roosevelt held conference with Count Cassini, the Russian Ambassador at Washington with a view of initiating or furthering peace negotiations between Russia and Japan.

June 5. Emperor Nicholas of Russia issued a ukase making General Trepoff, a bitter foe of revolutionary propaganda, Assistant Minister of the Interior.

June 6. German Crown Prince Frederick William and Duchess Cecilia of Mecklenburg-Schwerin married.

M. Delcasse, French Minister of foreign affairs, resigned from the Cabinet.

June 7. The Storthing, Norway's law making body, voted to dissolve the union between the kingdoms of Sweden and Norway.

At a meeting of the Council of Ministers held at Tsarskoe Selo, Russia, it was decided to learn of Japan's peace conditions.

June 8. A successful test of wireless telegraphy on high-speed trains was made on the Chicago and Alton railroad.

June 11. The Pennsylvania Railroad began its regular eighteen-hour service between New York and Chicago.

June 13. King Oscar in a letter to the Norwegian Storthing defended his course in vetoing the consular bill and claimed that he and Sweden had the right to say whether Norway should become an independent nation.

June 15. Russia and Japan expressed their willingness for the meeting of their peace plenipotentiaries to be at Washington, D. C.

June 16. Grand Duke Alexis, head of Russian Navy Department, resigned.

June 17. Death of General Maximo Gomez, the hero of the Cuban war for independence.

June 21. The Twentieth Century Limited of the L. S. & M. S. R.R. running on the 18-hour schedule from Chicago to New York was wrecked at Mentor, Ohio, and 19 persons killed.

Eighteen persons were killed and 100 wounded at Lodz, Russia, by Cossacks who fired upon a parade of workmen.

June 27. Open defiance of the Russian government was reported from many places in Poland, Caucucus and Russia proper.

June 28. The crew of the Russian battle-ship, *Kniaz Potemkine*, on the Black Sea, near Odessa, mutinied, killed a number of officers, took possession of the vessel and sailed at large.

June 29. Rioting at Odessa followed the revolt at sea and the casualties reported from the conflict between soldiers and citizens were 1,000 killed and 3,000 wounded.

June 30. President Roosevelt appointed John F. Stevens, of Chicago, Chief Engineer of the Panama Canal Commission to succeed John F. Wallace, resigned.

July 1. Secretary of State John Hay died at his summer home near Newbury, New Hampshire.

July 2. Official announcement by President Roosevelt of the Russian and Japanese envoys to the Washington peace conference was as follows: Russia—Count Muravieff, Ambassador to Italy, and Baron Rosen, Ambassador to the United States; Japan—Baron J. Komura, Minister of Foreign Affairs, and Kogora Takahira, Minister to the United States. [The Russian envoy Muravieff resigned shortly after his appointment and his place was filled by M. Witte.]

A cloudburst at the head of the gorge in which the city of Guanajuato, Mexico, is situated, destroyed millions of dollars worth of property and caused the loss of over a thousand lives.

July 7. Elihu Root appointed Secretary of State by President Roosevelt.

July 8. The mutinous sailors of the Russian battle-ship *Kniaz Potemkine*, surrendered to the Roumanian government at the port of Kustenji and abandoned their boat.

July 10. The Japanese captured and took possession of Sakhalin Island, off the coast of Siberia.

July 15. Chicago's estimated population by new directory was 2,273,000.

July 16. Robert E. Peary, the arctic explorer, sailed from the New York harbor on another expedition for the discovery of the north pole.

July 19. Attempt made to slay Pobiedonostseff, leader in Russian church, at St. Petersburg; Vice-Governor Deutrch of Finland badly wounded by a bomb, and Zemstvo Congress at Moscow raided by police.

July 21. The Chicago teamsters' strike, after a continuance of 105 days, was called off and union men sought their old jobs, many of them finding their former places permanently filled.

The United States gunboat, *Bennington*, 1,710 tons, in charge of Commander Lucien Young, was blown up in the harbor of San Diego, Cal., by an explosion of boilers. The crew numbered 197. Of these 62 were killed and 44 others more or less seriously injured.

July 22. To open a valuable waterway at Henderson's Point, in the Piscataqua River, near Portsmouth, N. H., 400 charges of dynamite, aggregating 45 tons, were simultaneously exploded, hurling a ledge of rock three acres in extent from the bed of the stream. It was said to be the greatest blast ever discharged in the United States.

July 24. The remains of Admiral John Paul Jones, brought from Paris, were transferred to a temporary vault in the navy yard at Annapolis, Md.

July 28. The Norwegian Storthing decided to submit the question of dissolution from Sweden to a referendum vote of the people.

July 30. Six persons were killed and 15 severely injured by three bolts of lightning on the beach at Coney Island.
